comments: To help others with the same problems as myself with artificial leg, getting around. If I don't have a car handy and just to get around without a car for the fun of it. I thought I would pass some conclusion along better understand what the future might hold for us.

A universal comments

This my thought on moving past the 20-30 year old with their Tour de France bicycles and look to what lies ahead.

When looking at what changes need to be made over the next couple of generations to add larger sidewalks and bicycling paths, it should be look at this perspective is person X. Person X will be the need to have a market, and or a pharmacy within three or more rings, that would be round trip, Ring 1, a mile, Ring 2, 1 1/2 miles and Ring 3, three miles. The reason I have set this up this way, as a person with artificial leg, a three mile walk round trip I can do on a good day with a slight climb in elevations. Using as a guide, you can figure out in a given location how many people for one reason or others will walk, bicycle, or use an electric scooter for transportation to said location.

One of the things I would like to see is a transport trike. What this a narrow down peddle taxi with a driver and one person that will fit in a standard bicycle lane. This way it can take a person who can't walk to the store and back. I tried several companies but they didn't warm to the ideal.
