

I-215 Corridor System Management Plan (CSMP) FACT SHEET

Description: This study includes the entire 54-mile route in San Bernardino and Riverside Counties. Current Average Annual Daily Traffic on I-215 ranges from approximately 65,000 to 184,000. By the year 2030 it is forecasted that annual Average Daily Traffic will range from 140,000 to 271,000. This study effort is being conducted with our partner cities, Riverside and San Bernardino Counties and key stakeholders such as SANBAG, RCTC, WRCOG, RTA and Omnitrans within the Southern California Association of Governments (SCAG) region. The purpose of this effort is to identify key areas of existing and expected congestion, deploy vehicle detection systems and use advanced micro-simulation software Vissim and Visum to better understand the benefit of a range of potential transportation projects that would improve the capacity of the corridor as well as merge and diverge operations.

Active Management of the I-215 Corridor: CSMP's will be the future of how the Department manages corridors for the highest performance in coordination with regional agencies regardless of project funding sources. The overall CSMP effort supports the *California Regional Blueprint Planning Program* because it's goal is to improve mobility and reliability, by making travel along the corridor efficient. This study effort will contribute to California's economic competitiveness and quality of life.

Status of Completion: It is expected that the study and related micro-simulation efforts will be completed by December of 2010.
