12 \$235,000 Monterey 05-Mon-1 28.0/28.6	Near Lucia, north of Big Creek Bridge. Ocean wave action has eroded the soil below the highway causing the shoulder to fall away. The slope at the edge of the shoulder is nearly vertical and large boulders on the slope are exposed and the surrounding material is loose. Distress cracks have been found in the pavement indicating movement beneath the roadway. The initial allocation was to install one-way traffic signalization system and temporary K-railing, and construct a rock-net system to protect traffic from falling rocks. This supplemental is necessary to extend the limits of the rock-net system and clean rock and debris falling on the roadway. A project to construct a viaduct is being developed as a long-term solution to stabilize this section of roadway (EA: 05-1F890). This compromised the wall structural integrity causing the outer edge of the paved shoulder and asphalt dike to collapse. This project is to excavate and back fill the damaged cells, use filter fabric to prevent migration of fine soil material, reconstruct shoulder and asphalt dike, and place more overside drains to prevent runoff from overtopping and washing out more infill. 26 \$750,000 Ventura 07-Ven-33 32.4	Near Ojai in the Los Padres National Forest. February 2014 heavy rain caused major erosion on the steep hillsides adjacent to the highway. Large areas of jointed and fractured heavy rock have become loose and falling onto the highway. This project is to scale the steep slopes and remove unstable rock. Rock and debris on the roadway will be removed. Scaling will be repeated as needed after successive storms including placement of catchment berms or high strength fencing if necessary. Initial G-11 Allocation 03/11/14: \$750,000	07-4669 SHOPP/13-14 0714000206 4 4X2404 Emergency	2012-13 302-0042 SHA 20.20.201.130	\$750,000

On March 11, 2014, and due to recent rain in the area, the hill adjacent to the highway is beginning to slide and cause uplift to the highway shoulder and travel way. This project is to excavate and back fill the roadway, replace damaged pavement, remove debris, install under-drains, and provide traffic control as necessary. Continued pavement distress and multiple attempts to stop the continuing deterioration of the fiberglass bridge deck on this experimental bridge built in 2000 using glass fiber reinforced polymer and fiber reinforced polymer concrete girders have not been successful. The bridge is currently reduced to one of two lanes due to severe pavement delamination and is at risk of accelerated deterioration and closure with no feasible detour. This project is to replace the superstructure with a precast concrete conventional slab bridge including placement of piles at the abutments and providing traffic control as necessary.
