### **Were the screening levels for Tables B-4 through B-10 in Attachment B exceeded?**

☐ Yes ☐ No → If No, skip to section XII below.

If "yes," identify the parameters for which screening levels were exceeded:

<sup>1</sup> Policy for the Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (State Implementation Policy or SIP).

## XI. ABILITY TO COMPLY WITH EFFLUENT LIMITATIONS

- ☐ How will you comply with the effluent limitations in this General Board Order for the pollutants that exceeded the applicable screening levels in Tables B-4 through B-10 Attachment B? *[Please describe the best management practices (BMP) and/or control strategies you will employ to ensure compliance with proposed discharge(s)]*

## XII. BMP OR CONTROL STRATEGY PLAN

- ☐ Do you have a BMP or Control Strategy Plan in place for your proposed discharge(s)?  
☐ Yes ☐ No
- ☐ If yes, is the BMP Plan consistent with the general guidance contained in the USEPA *Guidance Manual for Developing Best Management Practices* (BMPs) (EPA 833-B-93-004)?  
☐ Yes ☐ No
- Check applicable item below.*
- ☐ If you exceeded a screening level in Attachment B for any parameter, you must submit a BMP or Control Strategy Plan with your completed NOI. The BMP Plan must be consistent with the general guidance contained in the USEPA *Guidance Manual for Developing Best Management Practices* (BMPs) (EPA 833-B-93-004).  
☐ **Check here if a BMP or Control Strategy Plan is included in the NOI package.**
- ☐ If you did not exceed a screening level in Attachment B for any parameter, you must develop and implement a BMP Plan and have it available for inspection by the Regional Water Board. The BMP Plan must be consistent with the general guidance contained in the USEPA *Guidance Manual for Developing Best Management Practices* (BMPs) (EPA 833-B-93-004).

## XIII. CATEGORICAL EXCEPTION FOR PRIORITY POLLUTANT CRITERIA / OBJECTIVES

- Is the discharge necessary to implement control measures regarding drinking water conducted to fulfill statutory requirements under the federal Safe Drinking Water Act or the California Health and Safety Code? ☐ Yes ☐ No → If No skip to section XIV below.
- If "yes," the Discharger shall submit the following for the approval of the Executive Officer:
- ☐ A detailed description of the proposed action, including the proposed method of completing the action;
- ☐ A time schedule;
- ☐ A discharge and receiving water quality monitoring plan (before project initiation, during the project, and after project completion, with the appropriate quality control procedures); include summary results of monitoring for applicable parameters reported in the annual Consumer Confidence Report as required by Title 22, Division 4, Chapter 15, Article 20 of the California Code of Regulations
- ☐ California Environmental Quality Act (CEQA) documentation;
- ☐ Contingency plans;
- ☐ Identification of alternate water supply (if needed); and
- ☐ Residual waste disposal plans.

#### XIV. EVALUATION OF RECLAMATION OPTIONS

To obtain coverage under this General Board Order, the Discharger is required to evaluate reclamation options.

- ☐ Provide proof that discharge to the local municipal wastewater treatment plant is not viable or explain why it is infeasible to connect to the wastewater treatment plant. The Discharger may submit any denial or restrictive flow letter from the wastewater treatment plant as proof that this is not a viable option.
- ☐ Provide an explanation why land disposal is not a viable option.
- ☐ Provide an explanation why underground injection is not a viable option.

#### XV. FEES

- ☐ Provide the current State Water Board adopted permit fee, plus applicable surcharge(s). The current fees for Category 3 discharges (i.e., those discharges that require minimal or no treatment systems to meet limits and pose no significant threat to water quality) is \$1,200. The applicable surcharge is 21%. Consult <http://www.waterboards.ca.gov/resources/fees> to verify current fees.

#### XVI. CERTIFICATION

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

The Regional Water Board will be immediately notified of any violation, or threatened violation, of this General Board Permit.

#### XVII. OTHER

Attach additional sheets to explain any responses which need clarification. List attachments with titles and dates below:

A representative of the Regional Water Board will notify you within 30 days of receipt of your Notice of Intent. The notice will state if your discharge meets the criteria for this General Board Order, whether the Notice of Intent is complete, or if additional information must be submitted to complete your application, pursuant to division 7, section 13260 of the California Water Code.

The completion date of your application is normally the date when all required information, including the correct fee, is received by the Regional Water Board.

## **ATTACHMENT D – STANDARD PROVISIONS**

### **I. STANDARD PROVISIONS – PERMIT COMPLIANCE**

#### **A. Duty to Comply**

1. The Discharger must comply with all of the conditions of this General Board Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code and is grounds for enforcement action, for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application. (40 C.F.R. § 122.41(a).)
2. The Discharger shall comply with effluent standards or prohibitions established under section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions, even if this General Board Order has not yet been modified to incorporate the requirement. (40 C.F.R. § 122.41(a)(1).)

#### **B. Need to Halt or Reduce Activity Not a Defense**

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this General Board Order. (40 C.F.R. § 122.41(c).)

#### **C. Duty to Mitigate**

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this General Board Order that has a reasonable likelihood of adversely affecting human health or the environment. (40 C.F.R. § 122.41(d).)

#### **D. Proper Operation and Maintenance**

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this General Board Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this General Board Order. (40 C.F.R. § 122.41(e).)

#### **E. Property Rights**

1. This General Board Order does not convey any property rights of any sort or any exclusive privileges. (40 C.F.R. § 122.41(g).)

2. The issuance of this General Board Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of state or local law or regulations. (40 C.F.R. § 122.5(c).)

## **F. Inspection and Entry**

The Discharger shall allow the Regional Water Board, State Water Board, United States Environmental Protection Agency (USEPA), and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to (40 C.F.R. § 122.41(i); Wat. Code, § 13383):

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this General Board Order (40 C.F.R. § 122.41(i)(1));
2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this General Board Order (40 C.F.R. § 122.41(i)(2));
3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this General Board Order (40 C.F.R. § 122.41(i)(3)); and
4. Sample or monitor, at reasonable times, for the purposes of assuring General Board Order compliance or as otherwise authorized by the CWA or the Water Code, any substances or parameters at any location. (40 C.F.R. § 122.41(i)(4).)

## **G. Bypass**

### **1. Definitions**

- a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility. (40 C.F.R. § 122.41(m)(1)(i).)
  - b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production. (40 C.F.R. § 122.41(m)(1)(ii).)
2. Bypass not exceeding limitations. The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3, I.G.4, and I.G.5 below. (40 C.F.R. § 122.41(m)(2).)

3. Prohibition of bypass. Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless (40 C.F.R. § 122.41(m)(4)(i)):
  - a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage (40 C.F.R. § 122.41(m)(4)(i)(A));
  - b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance (40 C.F.R. § 122.41(m)(4)(i)(B)); and
  - c. The Discharger submitted notice to the Regional Water Board as required under Standard Provisions – Permit Compliance I.G.5 below. (40 C.F.R. § 122.41(m)(4)(i)(C).)
4. The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions – Permit Compliance I.G.3 above. (40 C.F.R. § 122.41(m)(4)(ii).)

## 5. Notice

- a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass. (40 C.F.R. § 122.41(m)(3)(i).)
- b. Unanticipated bypass. The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below (24-hour notice). (40 C.F.R. § 122.41(m)(3)(ii).)

## H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation. (40 C.F.R. § 122.41(n)(1).)

1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of Standard Provisions – Permit Compliance I.H.2 below are met. No determination made during administrative review of claims that noncompliance was

caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review. (40 C.F.R. § 122.41(n)(2).)

2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that (40 C.F.R. § 122.41(n)(3)):
  - a. An upset occurred and that the Discharger can identify the cause(s) of the upset (40 C.F.R. § 122.41(n)(3)(i));
  - b. The permitted facility was, at the time, being properly operated (40 C.F.R. § 122.41(n)(3)(ii));
  - c. The Discharger submitted notice of the upset as required in Standard Provisions – Reporting V.E.2.b below (24-hour notice) (40 C.F.R. § 122.41(n)(3)(iii)); and
  - d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above. (40 C.F.R. § 122.41(n)(3)(iv).)
3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof. (40 C.F.R. § 122.41(n)(4).)

## **II. STANDARD PROVISIONS – PERMIT ACTION**

### **A. General**

This General Board Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any General Board Order condition. (40 C.F.R. § 122.41(f).)

### **B. Duty to Reapply**

If the Discharger wishes to continue an activity regulated by this General Board Order after the expiration date of this General Board Order, the Discharger must apply for and obtain a new permit. (40 C.F.R. § 122.41(b).)

### **C. Transfers**

This General Board Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the General Board Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the Water Code. (40 C.F.R. § 122.41(l)(3); § 122.61.)

### **III. STANDARD PROVISIONS – MONITORING**

- A.** Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity. (40 C.F.R. § 122.41(j)(1).)
- B.** Monitoring results must be conducted according to test procedures under Part 136 or, in the case of sludge use or disposal, approved under Part 136 unless otherwise specified in Part 503 unless other test procedures have been specified in this General Board Order. (40 C.F.R. § 122.41(j)(4); § 122.44(i)(1)(iv).)

### **IV. STANDARD PROVISIONS – RECORDS**

- A.** Except for records of monitoring information required by this General Board Order related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by Part 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this General Board Order, and records of all data used to complete the application for this General Board Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time. (40 C.F.R. § 122.41(j)(2).)

**B. Records of monitoring information shall include:**

- 1. The date, exact place, and time of sampling or measurements (40 C.F.R. § 122.41(j)(3)(i));
- 2. The individual(s) who performed the sampling or measurements (40 C.F.R. § 122.41(j)(3)(ii));
- 3. The date(s) analyses were performed (40 C.F.R. § 122.41(j)(3)(iii));
- 4. The individual(s) who performed the analyses (40 C.F.R. § 122.41(j)(3)(iv));
- 5. The analytical techniques or methods used (40 C.F.R. § 122.41(j)(3)(v)); and
- 6. The results of such analyses. (40 C.F.R. § 122.41(j)(3)(vi).)

**C. Claims of confidentiality for the following information will be denied (40 C.F.R. § 122.7(b)):**

- 1. The name and address of any permit applicant or Discharger (40 C.F.R. § 122.7(b)(1)); and
- 2. Permit applications and attachments, permits and effluent data. (40 C.F.R. § 122.7(b)(2).)

## **V. STANDARD PROVISIONS – REPORTING**

### **A. Duty to Provide Information**

The Discharger shall furnish to the Regional Water Board, State Water Board, or USEPA within a reasonable time, any information which the Regional Water Board, State Water Board, or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this General Board Order or to determine compliance with this General Board Order. Upon request, the Discharger shall also furnish to the Regional Water Board, State Water Board, or USEPA copies of records required to be kept by this General Board Order. (40 C.F.R. § 122.41(h); Wat. Code, § 13267.)

### **B. Signatory and Certification Requirements**

1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or USEPA shall be signed and certified in accordance with Standard Provisions – Reporting V.B.2, V.B.3, V.B.4, and V.B.5 below. (40 C.F.R. § 122.41(k).)
2. All permit applications shall be signed by a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (i) A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided, the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures. (40 C.F.R. § 122.22(a)(1).)
3. All reports required by this General Board Order and other information requested by the Regional Water Board, State Water Board, or USEPA shall be signed by a person described in Standard Provisions – Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:
  - a. The authorization is made in writing by a person described in Standard Provisions – Reporting V.B.2 above (40 C.F.R. § 122.22(b)(1));
  - b. The authorization specifies either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of

- equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company. (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) (40 C.F.R. § 122.22(b)(2)); and
- c. The written authorization is submitted to the Regional Water Board and State Water Board. (40 C.F.R. § 122.22(b)(3).)
4. If an authorization under Standard Provisions – Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions – Reporting V.B.3 above must be submitted to the Regional Water Board and State Water Board prior to or together with any reports, information, or applications, to be signed by an authorized representative. (40 C.F.R. § 122.22(c).)
5. Any person signing a document under Standard Provisions – Reporting V.B.2 or V.B.3 above shall make the following certification:
- “I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.” (40 C.F.R. § 122.22(d).)

### **C. Monitoring Reports**

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program (Attachment E) in this General Board Order. (40 C.F.R. § 122.22(l)(4).)
2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices. (40 C.F.R. § 122.41(l)(4)(i).)
3. If the Discharger monitors any pollutant more frequently than required by this General Board Order using test procedures approved under Part 136 or, in the case of sludge use or disposal, approved under Part 136 unless otherwise specified in Part 503, or as specified in this General Board Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Regional Water Board. (40 C.F.R. § 122.41(l)(4)(ii).)

4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order. (40 C.F.R. § 122.41(l)(4)(iii).)

#### **D. Compliance Schedules**

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this General Board Order, shall be submitted no later than 14 days following each schedule date. (40 C.F.R. § 122.41(l)(5).)

#### **E. Twenty-Four Hour Reporting**

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance. (40 C.F.R. § 122.41(l)(6)(i).)
2. The following shall be included as information that must be reported within 24 hours under this paragraph (40 C.F.R. § 122.41(l)(6)(ii)):
  - a. Any unanticipated bypass that exceeds any effluent limitation in this General Board Order. (40 C.F.R. § 122.41(l)(6)(ii)(A).)
  - b. Any upset that exceeds any effluent limitation in this General Board Order. (40 C.F.R. § 122.41(l)(6)(ii)(B).)
3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours. (40 C.F.R. § 122.41(l)(6)(iii).)

#### **F. Planned Changes**

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when (40 C.F.R. § 122.41(l)(1)):

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in section 122.29(b) (40 C.F.R. § 122.41(l)(1)(i)); or
2. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing

permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan. (40 C.F.R. § 122.41(l)(1)(iii).)

#### **G. Anticipated Noncompliance**

The Discharger shall give advance notice to the Regional Water Board or State Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with General Board Order requirements. (40 C.F.R. § 122.41(l)(2).)

#### **H. Other Noncompliance**

The Discharger shall report all instances of noncompliance not reported under Standard Provisions – Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E above. (40 C.F.R. § 122.41(l)(7).)

#### **I. Other Information**

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Water Board, State Water Board, or USEPA, the Discharger shall promptly submit such facts or information. (40 C.F.R. § 122.41(l)(8).)

### **VI. STANDARD PROVISIONS – ENFORCEMENT**

- A.** The Regional Water Board is authorized to enforce the terms of this permit under several provisions of the Water Code, including, but not limited to, sections 13385, 13386, and 13387

### **VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS**

#### **A. Non-Municipal Facilities**

Existing manufacturing, commercial, mining, and silvicultural Dischargers shall notify the Regional Water Board as soon as they know or have reason to believe (40 C.F.R. § 122.42(a)):

- 1.** That any activity has occurred or will occur that would result in the discharge, on a routine or frequent basis, of any toxic pollutant that is not limited in this General Board Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(1)):
  - a.** 100 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(1)(i));
  - b.** 200 µg/L for acrolein and acrylonitrile; 500 µg/L for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(1)(ii));

- c.** Five (5) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(1)(iii)); or
  - d.** The level established by the Regional Water Board in accordance with section 122.44(f). (40 C.F.R. § 122.42(a)(1)(iv).)
- 2.** That any activity has occurred or will occur that would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant that is not limited in this General Board Order, if that discharge will exceed the highest of the following "notification levels" (40 C.F.R. § 122.42(a)(2)):
  - a.** 500 micrograms per liter (µg/L) (40 C.F.R. § 122.42(a)(2)(i));
  - b.** 1 milligram per liter (mg/L) for antimony (40 C.F.R. § 122.42(a)(2)(ii));
  - c.** Ten (10) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge (40 C.F.R. § 122.42(a)(2)(iii)); or
  - d.** The level established by the Regional Water Board in accordance with section 122.44(f). (40 C.F.R. § 122.42(a)(2)(iv).)

## **ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)**

The *Code of Federal Regulations* (CFR), section 122.48 requires that all National Pollutant Discharge Elimination System (NPDES) permits specify monitoring and reporting requirements. California Water Code (CWC) sections 13267 and 13383 also authorize the Regional Water Quality Control Board (Regional Water Board) to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements, which implement the federal and California regulations.

### **I. GENERAL MONITORING PROVISIONS**

- A.** Samples and measurements taken as required herein shall be representative of the volume and nature of the monitored discharge. All samples shall be collected at the monitoring locations specified below and in the Notice of Authorization (NOA) granted by the Regional Water Board's Executive Officer, and, unless otherwise specified, at the most representative sampling point available before the monitored flow joins the receiving water. Monitoring locations shall not be changed without notification to and the approval of this Regional Water Board.
- B.** Appropriate flow measurement devices and methods consistent with accepted scientific practices shall be selected and used to ensure the accuracy and reliability of measurements of the volume of monitored discharges. The devices shall be installed, calibrated, and maintained to ensure that the accuracy of the measurements is consistent with the accepted capability of that type of device. Devices selected shall be capable of measuring flows with a maximum deviation of less than  $\pm 10$  percent from true discharge rates throughout the range of expected discharge volumes. Guidance in the selection, installation, calibration, and operation of acceptable flow measurement devices may be obtained from the following references:
  - 1. "A Guide to Methods and Standards for the Measurement of Water Flow," U.S. Department of Commerce, National Bureau of Standards, NBS Special Publication 421, May 1975, 96 pp. (Available from the U.S. Government Printing Office, Washington, D.C. 20402. Order by SD Catalog No. C13.10:421.)
  - 2. "Water Measurement Manual," U.S. Department of Interior, Bureau of Reclamation, Second Edition, Revised Reprint, 1974, 327 pp. (Available from the U.S. Government Printing Office, Washington, D.C. 20402. Order by Catalog No. 172.19/2:W29/2, Stock No. S/N 24003-0027.)
  - 3. "Flow Measurement in Open Channels and Closed Conduits," U.S. Department of Commerce, National Bureau of Standards, NBS Special Publication 484, October 197, 982 pp. (Available in paper copy or microfiche from National Technical Information Services (NTIS) Springfield, VA 22151. Order by NTIS No. PB-273 535/5ST.)

4. "NPDES Compliance Sampling Manual," U.S. Environmental Protection Agency (USEPA), Office of Water Enforcement, Publication MDC-51, 1977, 140 pp. (Available from the General Services Administration (8FFS), Centralized Mailing Lists Services, Building 41, Denver Federal Center, CO 80225.)
- C. All monitoring instruments and devices used by the Discharger to fulfill the prescribed monitoring program shall be properly maintained and calibrated as necessary to ensure their continued accuracy. All flow measurement devices shall be calibrated at least once per year, or more frequently, to ensure continued accuracy of the devices.
- D. All analyses shall be conducted at a laboratory certified for such analyses by the State Department of Public Health. Laboratories analyzing monitoring samples shall be certified by the Department of Public Health, in accordance with the provision of CWC section 13176, and must include quality assurance/quality control data with their reports.
- E. Chemical and bacteriological analyses shall be conducted at a laboratory certified for such analyses by the State Department of Public Health (DPH; formerly the Department of Health Services).
- F. All analyses shall be performed in a laboratory certified to perform such analyses by the California DPH, with the exception of total residual chlorine, pH, electrical conductivity and temperature. Laboratories that perform sample analyses shall be identified in all monitoring reports. A quality control and assurance manual containing steps for sampling and analysis for total residual chlorine, pH, electrical conductivity, and temperature shall be maintained and available for inspection by Regional Board staff. A Quality Assurance-Quality Control Program must conform to USEPA guidelines and instituted by the laboratory for these analyses.
- G. The collection, preservation, and holding times of all samples shall be in accordance with the test procedures under 40 CFR Part 136 (revised as of May 14, 1999) "Guidelines Establishing Test Procedures for the Analysis of Pollutants," promulgated by the United States Environmental Protection Agency (USEPA), unless otherwise specified in this MRP. In addition, the Regional Water Board and/or USEPA, at their discretion, may specify test methods that are more sensitive than those specified in 40 CFR Part 136.
- H. Monitoring results, including noncompliance, shall be reported at intervals and in a manner specified in this MRP.
- I. If the facility is not in operation, or there is no discharge during a required reporting period, the Discharger shall forward a letter to the Regional Water Board indicating that there has been no activity during the required reporting period.
- J. Except for data determined to be confidential under the Clean Water Act (CWA) section 308, all reports prepared in accordance with the terms of this General Board Order shall be available for public inspection at the offices of the Regional Water Board and the Regional Administrator of USEPA. As required by the CWA, effluent data shall not be

considered confidential. Knowingly making any false statements on any such report may result in the imposition of criminal penalties as provided for in CWA section 309 and CWC section 13387.

## II. MONITORING LOCATIONS

Each Discharger shall establish the following monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this General Board Order.

**Table E-1. Monitoring Station Locations**

| Discharge Point Name | Monitoring Location Name | Monitoring Location Description  |
|----------------------|--------------------------|--|
| 001 <sup>1</sup>     | EFF-001                  | A location where a representative sample of the effluent can be collected.   |
| --                   | RSW-001                  | Immediately upstream of the discharge point to obtain a representative sample of the background conditions of the upstream flow. |
| --                   | RSW-002                  | Downstream of the discharge point to obtain a representative sample of the combined flow.  |

<sup>1</sup> Dischargers with more than one discharge point must comply with the effluent limitations and monitoring requirements of this General Board Order at each discharge point as identified in the Notice of Applicability (NOA).

## III. INFLUENT MONITORING REQUIREMENTS – Not Applicable

## IV. EFFLUENT MONITORING REQUIREMENTS

### A. Monitoring Location EFF-001

1. All Dischargers shall monitor their low threat wastewater at EFF-001 according to the requirements in Table E-2. Dischargers with more than one discharge point must comply with the effluent limitations and monitoring requirements in this General Board Order at each discharge point as specified in the NOA.

**Table E-2. Effluent Monitoring for All Discharges**

| Parameter   | Units <sup>1</sup> | Sample Type | Minimum Sampling Frequency <sup>2</sup> | Required Analytical Test Method |
|---|--------------------|-------------|---|---------------------------------|
| Flow <sup>10</sup>  | gpd                | Estimate    | 1X/Day                                  | 3                               |
| TSS <sup>4</sup>  | mg/L               | Grab        | 1X/Discharge                            | 3                               |
| Oil and Grease <sup>4</sup>                                 | mg/L               | Grab        | 1X/Discharge                            | 3                               |
| pH <sup>4</sup>   | standard units     | Grab        | 1X/Discharge                            | 3, 6                            |
| Total Dissolved Solids <sup>4</sup>                         | mg/L               | Grab        | 1X/Discharge                            | 3, 7                            |
| Total Petroleum Hydrocarbons <sup>5</sup>                   | mg/L               | Grab        | 1X/Discharge                            | 3                               |
| Hardness, Total (as CaCO <sub>3</sub> ) <sup>9</sup>        | mg/L               | Grab        | 1X/Year                                 | 3                               |
| Priority Pollutant listed in Table B-2 and B-3 <sup>9</sup> | µg/L               | Grab        | 1X/Year                                 | 3, 8                            |

<sup>1</sup> gpd = gallons per day

µg/L = micrograms per liter

<sup>2</sup> If the discharge is intermittent rather than continuous, then on the first day of each intermittent discharge, the Discharger shall monitor and record data for all of the constituents in Table E-2 above, after which the frequencies of analysis given in the schedule shall apply for the duration of each such intermittent discharge. The Discharger shall not be required to monitor and record data more often than twice the frequencies listed in the table.

<sup>3</sup> Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136. Where no methods are specified for a given pollutant, the methods must be approved by this Regional Water Board or the State Water Board.

<sup>4</sup> Not applicable to discharges from established water supply systems where parameter is not expected to exceed screening level.

<sup>5</sup> Applies only to dewatering/discharge operations near suspected petroleum hydrocarbon contaminated sites or when diesel or gasoline powered generator is used in dewatering/discharge operation.

<sup>6</sup> A handheld field meter may be used, provided the meter utilizes a USEPA-approved algorithm/method and is calibrated and maintained in accordance with the manufacturer's instructions. A calibration and maintenance log for each meter used for monitoring required by this MRP shall be maintained by the Discharger.

<sup>7</sup> Electrical conductivity data (µmhos/cm = micromhos per centimeter) can be used for total dissolved solids if the discharger can produce a correlation between the two parameters.

<sup>8</sup> If the priority pollutants were monitored at the onset during the application process, the discharger may submit the analytical results in lieu of the first sampling results.

<sup>9</sup> Dischargers approved for a categorical exception for meeting the priority pollutant criteria/objectives as authorized by section 5.3 of the SIP are not required to perform wastewater sampling for priority pollutants and hardness.

<sup>10</sup> Not applicable to untreated discharges from groundwater wells used as drinking water sources.

2. Discharges of wastewater from water system-related activities shall monitor their low threat wastewater at EFF-001 according to the requirements in Table E-2 through E3. Dischargers with more than one discharge point must comply with the effluent limitations and monitoring requirements in this General Board Order at each discharge point as specified in the NOA.

**Table E-3. Effluent Monitoring for Water System-Related Activities Discharges**

| Parameter                             | Units <sup>1</sup> | Sample Type | Minimum Sampling Frequency <sup>2</sup> | Required Analytical Test Method |
|---------------------------------------|--------------------|-------------|---|---------------------------------|
| Chlorine, Total Residual <sup>6</sup> | mg/L               | Grab        | 1X/Discharge                            | 3, 4, 5                         |

<sup>1</sup> mg/L = milligrams per liter

<sup>2</sup> If the discharge is intermittent rather than continuous, then on the first day of each intermittent discharge, the Discharger shall monitor and record data for all of the constituents in Table E-3 above, after which the frequencies of analysis given in the schedule shall apply for the duration of each such intermittent discharge. The Discharger shall not be required to monitor and record data more often than twice the frequencies listed in the table.

<sup>3</sup> Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136. Where no methods are specified for a given pollutant, the methods must be approved by this Regional Water Board or the State Water Board.

<sup>4</sup> A handheld field meter may be used, provided the meter utilizes a USEPA-approved algorithm/method and is calibrated and maintained in accordance with the manufacturer's instructions. A calibration and maintenance log for each meter used for monitoring required by this MRP shall be maintained by the Discharger.

<sup>5</sup> Total chlorine residual shall be monitored with a method sensitive to and accurate at a reporting level of 0.08 mg/L, or any more stringent reporting level included in a final statewide policy or standard for total residual chlorine.

<sup>6</sup> Not applicable to discharges from groundwater wells before chlorine is added to the water delivered to the potable water system.

- Discharges of wastewater from hydrostatic test water-related activities shall monitor their low threat wastewater at EFF-001 according to the requirements in Table E-2 through E4. Dischargers with more than one discharge point must comply with the effluent limitations and monitoring requirements in this General Board Order at each discharge point as specified in the NOA.

**Table E-4. Effluent Monitoring for Hydrostatic Test Water-Related Activities Discharges**

| Parameter   | Units <sup>1</sup> | Sample Type | Minimum Sampling Frequency <sup>2</sup> | Required Analytical Test Method |
|---|--------------------|-------------|---|---------------------------------|
| Total Suspended Solids                                | mg/L               | Grab        | 1X/Discharge                            | 3                               |
| BOD <sub>5</sub> @ 20 °C or CBOD <sub>5</sub> @ 20 °C | mg/L               | Grab        | 1X/Discharge                            | 3                               |
| Oil and Grease  | mg/L               | Grab        | 1X/Discharge                            | 3                               |
| Turbidity   | NTU                | Grab        | 1X/Discharge                            | 3, 4                            |
| Settleable Solids                                     | ml/L               | Grab        | 1X/Discharge                            | 3                               |
| Chlorine, Total Residual                              | mg/L               | Grab        | 1X/Discharge                            | 3, 4, 5                         |

| Parameter | Units <sup>1</sup> | Sample Type | Minimum Sampling Frequency <sup>2</sup> | Required Analytical Test Method |
|-----------|--------------------|-------------|---|---------------------------------|
|-----------|--------------------|-------------|---|---------------------------------|

<sup>1</sup> mg/L = milligrams per liter

ml/L = milliliter per liter

NTU = Nephelometric Turbidity Units

<sup>2</sup> If the discharge is intermittent rather than continuous, then on the first day of each intermittent discharge, the Discharger shall monitor and record data for all of the constituents in Table E-4 above, after which the frequencies of analysis given in the schedule shall apply for the duration of each such intermittent discharge. The Discharger shall not be required to monitor and record data more often than twice the frequencies listed in the table.

<sup>3</sup> Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136. Where no methods are specified for a given pollutant, the methods must be approved by this Regional Water Board or the State Water Board.

<sup>4</sup> A handheld field meter may be used, provided the meter utilizes a USEPA-approved algorithm/method and is calibrated and maintained in accordance with the manufacturer's instructions. A calibration and maintenance log for each meter used for monitoring required by this MRP shall be maintained by the Discharger.

<sup>5</sup> Total chlorine residual shall be monitored with a method sensitive to and accurate at a reporting level of 0.08 mg/L, or any more stringent reporting level included in a final statewide policy or standard for total residual chlorine.

4. Discharges of wastewater to Specific Waterbodies shall monitor their low threat wastewater at EFF-001 according to the requirements provided in subsection IV.A.1 through 3 and Table E-5. Dischargers with more than one discharge point must comply with the effluent limitations and monitoring requirements in this General Board Order at each discharge point as specified in the NOA

**Table E-5. Effluent Monitoring for Discharges to Specific Waterbodies<sup>1</sup>**

| Parameter                                     | Units <sup>2</sup> | Sample Type | Minimum Sampling Frequency <sup>3</sup> | Required Analytical Test Method |
|---|--------------------|-------------|---|---------------------------------|
| <i>Eschericia coli</i> (E. coli) <sup>6</sup> | MPN/100 mL         | Grab        | 1X/Discharge <sup>4</sup>               | 5                               |
| Enterococci <sup>6</sup>                      | MPN/100 mL         | Grab        | 1X/Discharge <sup>4</sup>               | 5                               |
| Fecal Coliform Organisms <sup>6</sup>         | MPN/100 mL         | Grab        | 1X/Discharge <sup>4</sup>               | 5                               |

| Parameter | Units <sup>2</sup> | Sample Type | Minimum Sampling Frequency <sup>3</sup> | Required Analytical Test Method |
|-----------|--------------------|-------------|---|---------------------------------|
|-----------|--------------------|-------------|---|---------------------------------|

<sup>1</sup> Dischargers proposing to discharge low threat wastewater under this General Board Order to waterbodies designated as REC-I or REC-II, segments of the Colorado River designated as REC-I or REC-II, or the New River shall analyze a representative sample of the effluent for the parameters as indicated in Tables B-8 through B-10.

<sup>2</sup> MPN/100 mL = most probable number per 100 milliliters

<sup>3</sup> If the discharge is intermittent rather than continuous, then on the first day of each intermittent discharge, the Discharger shall monitor and record data for all of the constituents in Table E-5 above, after which the frequencies of analysis given in the schedule shall apply for the duration of each such intermittent discharge. The Discharger shall not be required to monitor and record data more often than twice the frequencies listed in the table.

<sup>4</sup> If discharge period is over 30 calendar days a minimum of 5 samples are required within 30 days. At least one sample per week.

<sup>5</sup> Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136. Where no methods are specified for a given pollutant, the methods must be approved by this Regional Water Board or the State Water Board.

<sup>6</sup> Not applicable to discharges from established water supply systems where parameter is not expected to exceed screening level.

## V. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS – Not Applicable

## VI. LAND DISCHARGE MONITORING REQUIREMENTS – Not Applicable

## VII. RECLAMATION MONITORING REQUIREMENTS – Not Applicable

## VIII. RECEIVING WATER MONITORING REQUIREMENTS

### A. Monitoring Location RSW-001 (Upstream Receiving Water)

The Discharger shall monitor the receiving water at monitoring location RSW-001, as in Table E-6 below. In the event that no receiving water is present at RSW-001, receiving water monitoring at RSW-001 is not required.

**Table E-6. Upstream Receiving Water Monitoring Requirements**

| Parameter  | Units <sup>1</sup> | Sample Type | Minimum Sampling Frequency <sup>2</sup> | Required Analytical Test Method |
|--|--------------------|-------------|---|---------------------------------|
| Dissolved Oxygen <sup>6</sup>                        | mg/L               | Grab        | 1X/Discharge                            | <sup>3</sup>                    |
| Total Dissolved Solids <sup>6</sup>                  | mg/L               | Grab        | 1X/Discharge                            | <sup>3, 4</sup>                 |
| pH <sup>6</sup>                                      | standard units     | Grab        | 1X/Discharge                            | <sup>3</sup>                    |
| Hardness, Total (as CaCO <sub>3</sub> ) <sup>5</sup> | mg/L               | Grab        | 1X/Year                                 | <sup>3</sup>                    |
| Temperature <sup>6</sup>                             | °F                 | Grab        | 1X/Discharge                            | <sup>3</sup>                    |

| Parameter | Units <sup>1</sup> | Sample Type | Minimum Sampling Frequency <sup>2</sup> | Required Analytical Test Method |
|-----------|--------------------|-------------|---|---------------------------------|
|-----------|--------------------|-------------|---|---------------------------------|

<sup>1</sup> mg/L = milligrams per liter

°F = Degrees Fahrenheit

<sup>2</sup> If the discharge is intermittent rather than continuous, then on the first day of each intermittent discharge, the Discharger shall monitor and record data for all of the constituents in Table E-6 above, after which the frequencies of analysis given in the schedule shall apply for the duration of each such intermittent discharge. The Discharger shall not be required to monitor and record data more often than twice the frequencies listed in the table.

<sup>3</sup> Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136. Where no methods are specified for a given pollutant, the methods must be approved by this Regional Water Board or the State Water Board

<sup>4</sup> Electrical conductivity data (µmhos/cm = micromhos per centimeter) can be used for total dissolved solids if the discharger can produce a correlation between the two parameters.

<sup>5</sup> Dischargers approved for a categorical exception for meeting the priority pollutant criteria/objectives as authorized by section 5.3 of the SIP are not required to perform wastewater sampling for hardness.

<sup>6</sup> Not applicable to discharges from established water supply systems where parameter is not expected to exceed screening level.

## B. Monitoring Location RSW-002 (Downstream Receiving Water)

The Discharger shall monitor the receiving water at monitoring location RSW-002, as in Table E-7 below. In the event that no receiving water is present at RSW-002, receiving water monitoring at RSW-002 is not required. Similarly, if the discharge is to a storm drain system, monitoring is not required unless the discharge flow is contributing to the downstream receiving waterbody.

**Table E-7. Downstream Receiving Water Monitoring Requirements**

| Parameter                           | Units <sup>1</sup> | Sample Type | Minimum Sampling Frequency <sup>2</sup> | Required Analytical Test Method |
|-------------------------------------|--------------------|-------------|---|---------------------------------|
| Dissolved Oxygen <sup>5</sup>       | mg/L               | Grab        | 1X/Discharge                            | 3                               |
| Total Dissolved Solids <sup>5</sup> | mg/L               | Grab        | 1X/Discharge                            | 3, 4                            |
| pH <sup>5</sup>                     | standard units     | Grab        | 1X/Discharge                            | 3                               |
| Temperature <sup>5</sup>            | °F                 | Grab        | 1X/Discharge                            | 3                               |

<sup>1</sup> mg/L = milligrams per liter

°F = Degrees Fahrenheit

<sup>2</sup> If the discharge is intermittent rather than continuous, then on the first day of each intermittent discharge, the Discharger shall monitor and record data for all of the constituents in Table E-7 above, after which the frequencies of analysis given in the schedule shall apply for the duration of each such intermittent discharge. The Discharger shall not be required to monitor and record data more often than twice the frequencies listed in the table.

<sup>3</sup> Pollutants shall be analyzed using the analytical methods described in 40 CFR Part 136. Where no methods are specified for a given pollutant, the methods must be approved by this Regional Water Board or the State Water Board

<sup>4</sup> Electrical conductivity data (µmhos/cm = micromhos per centimeter) can be used for total dissolved solids if the discharger can produce a correlation between the two parameters

<sup>5</sup> Not applicable to discharges from established water supply systems where parameter is not expected to exceed screening level.

## IX. OTHER MONITORING REQUIREMENTS – Not Applicable

## X. REPORTING REQUIREMENTS

### A. General Monitoring and Reporting Requirements

1. New Dischargers who have received an NOA for coverage under this General Board Order shall inform the Regional Water Board 24 hours before the start of the initial discharge.
2. The Discharger shall comply with all Standard Provisions (Attachment D) related to monitoring, reporting, and recordkeeping.
3. Monitoring frequencies may be adjusted by the Executive Officer to a less frequent basis if a Discharger makes a request and the request is backed by statistical trends of monitoring data submitted.

### B. Self Monitoring Reports (SMRs)

1. At any time during the term of this permit, the State or Regional Water Board may notify the Discharger to electronically submit Self-Monitoring Reports (SMRs) using the State Water Board's California Integrated Water Quality System (CIWQS) program Web site ([http://www.waterboards.ca.gov/water\\_issues/programs/ciwqs/](http://www.waterboards.ca.gov/water_issues/programs/ciwqs/)). Until such notification is given, the Discharger shall submit hard copy SMRs. The CIWQS Web site will provide additional directions for SMR submittal in the event there will be service interruption for electronic submittal.
2. Authorized Dischargers shall report in the SMR the results for all monitoring specified in this MRP under sections II through VIII. The Discharger shall submit monthly, quarterly, semiannual, annual SMRs including the results of all required monitoring using USEPA-approved test methods or other test methods specified in this General Board Order. If the Discharger monitors any pollutant more frequently than required by this General Board Order, the results of this monitoring shall be included in the calculations and reporting of the data submitted in the SMR.
3. Monitoring periods and reporting for project specific required monitoring shall be completed according to the following schedule:

**Table E-8. Monitoring Periods and Reporting Schedule**

| Sampling Frequency  | Monitoring Period Begins On... | Monitoring Period | SMR Due Date                                  |
|---------------------|--------------------------------|-------------------|---|
| 1 / Discharge Event | NOA effective date             | All               | May 1<br>August 1<br>November 1<br>February 1 |

| Sampling Frequency | Monitoring Period Begins On...  | Monitoring Period  | SMR Due Date                                  |
|--------------------|---|--|---|
| 1 / Day            | NOA effective date  | Midnight through 11:59 pm or any 24-hour period that reasonably represents a calendar day for the purposes of sampling | May 1<br>August 1<br>November 1<br>February 1 |
| 2 / Week           | Sunday following NOA effective date <i>or</i> on NOA effective date if a Sunday   | Sunday through Saturday  | May 1<br>August 1<br>November 1<br>February 1 |
| 1 / Month          | First day of calendar month following NOA effective date <i>or</i> on NOA effective date if that date is the first day of the month | First day of calendar month through last day of calendar month   | May 1<br>August 1<br>November 1<br>February 1 |
| 2 / Month          | First day of calendar month following NOA effective date <i>or</i> on NOA effective date if that date is the first day of the month | First day of calendar month through last day of calendar month   | May 1<br>August 1<br>November 1<br>February 1 |
| 1 / Quarter        | Closest of January 1, April 1, July 1, or October 1 following ( <i>or on</i> ) NOA effective date                                   | January 1 through March 31<br>April 1 through June 30<br>July 1 through September 30<br>October 1 through December 31  | May 1<br>August 1<br>November 1<br>February 1 |
| 1 / Year           | January 1 following ( <i>or on</i> ) NOA effective date   | January 1 through December 31  | February 1                                    |
| 2 / Year           | Closest of January 1 or July 1 following ( <i>or on</i> ) NOA effective date  | January 1 through June 30<br>July 1 through December 31  | February 1<br>August 1                        |

4. Monitoring periods and reporting for agencies with categorical exception shall be annually.

### C. Reporting Protocols

Authorized Dischargers shall report with each sample result the applicable reported ML and the current Method Detection Limit (MDL), as determined by the procedure in 40 CFR Part 136.

The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:

1. Sample results greater than or equal to the reported ML shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).

2. Sample results less than the reporting level (RL), but greater than or equal to the laboratory's MDL, shall be reported as "Detected, but Not Quantified," or DNQ. The estimated chemical concentration of the sample shall also be reported.

For the purposes of data collection, the laboratory shall write the estimated chemical concentration next to DNQ as well as the words "Estimated Concentration" (may be shortened to "Est. Conc."). The laboratory may, if such information is available, include numerical estimates of the data quality for the reported result. Numerical estimates of data quality may be percent accuracy (+ a percentage of the reported value), numerical ranges (low to high), or any other means considered appropriate by the laboratory.

3. Sample results less than the laboratory's MDL shall be reported as "Not Detected," or ND.
4. Dischargers are to instruct laboratories to establish calibration standards so that the ML value (or its equivalent if there is differential treatment of samples relative to calibration standards) is the lowest calibration standard. At no time is the Discharger to use analytical data derived from extrapolation beyond the lowest point of the calibration curve.
5. **Multiple Sample Data.** If the permit contains an average monthly effluent limitation (AMEL) for a priority pollutant and more than one sample result is available for the pollutant, the Discharger shall report the arithmetic mean unless the data set contains one or more reported determinations of DNQ or ND. In those cases, the Discharger shall report the median in place of the arithmetic mean in accordance with the following procedure:
  - a. The data set shall be ranked from low to high, ranking the reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.
  - b. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.
6. Authorized Dischargers shall submit SMRs in accordance with the following requirements:
  - a. The Discharger shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the facility is operating in compliance with interim and/or final effluent limitations. The Discharger is not required to duplicate the submittal of data that is entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for

entry into a tabular format within the system, the Discharger shall electronically submit the data in a tabular format as an attachment.

- b. The Discharger shall attach a cover letter to the SMR. The information contained in the cover letter shall clearly identify violations of the waste discharge requirements (WDRs); discuss corrective actions taken or planned; and the proposed time schedule for corrective actions. Identified violations must include a description of the requirement that was violated and a description of the violation.
- c. SMRs shall be submitted to the Regional Water Board, signed and certified as required by the Standard Provisions (Attachment D), to the address listed below in Table E-9:

**Table E-9. Self-Monitoring Report – Mailing Address**

| <b>Standard Mail/FedEx/UPS/Other Private Carriers</b>  |
|--|
| California Regional Water Quality Control Board<br>Colorado River Basin Region<br>73-720 Fred Waring, Suite 100<br>Palm Desert, CA 92260 |

#### **D. Discharge Monitoring Reports (DMRs) – Not Applicable**

#### **E. Other Reports**

- 1. **Annual Report.** By February 1 of each year, the Discharger shall submit a written report to the Executive Officer containing the following:
  - a. The names and telephone numbers of persons to contact regarding the facility/project for emergency and routine situations.
  - b. A statement certifying whether the current Best Management Practices (BMP) or Control Strategy Plan, reflect the Discharger's operations as currently constructed and operated, and the date when the BMP or Control Strategy Plan was last revised and last reviewed for adequacy.
  - c. Dischargers shall provide a summary report that includes the number, frequency, rate, and types of discharges to the receiving water(s).
  - d. For those dischargers with a project specific NOA, a statement certifying that the discharges conducted in the previous year were in compliance with this General Board Order.

- e. For those dischargers granted a categorical exception under 5.3 of the SIP, a statement certifying that the discharges conducted in the previous year were necessary to implement control measures regarding drinking water conducted to fulfill statutory requirements under the federal Safe Drinking Water Act or the California Health and Safety Code and were in compliance with this General Board Order.

## ATTACHMENT F – FACT SHEET

As described in section II of this General Board Order, this Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this General Board Order.

This General Board Order has been prepared under a standardized format to accommodate a broad range of discharge requirements for Dischargers in California. Only those sections or subsections of this General Board Order that are specifically identified as “not applicable” have been determined not to apply to this Discharger. Sections or subsections of this General Board Order not specifically identified as “not applicable” are fully applicable to this Discharger.

### I. PERMIT INFORMATION

For the purposes of this General Board Order, references to the terms, Discharger, Permittee or Enrollee, in applicable federal and state laws, regulations, plans, or policy are held to be equivalent to the term, Discharger, herein.

#### A. Background

In 1972, the Federal Water Pollution Control Act (also referred to as the Clean Water Act or CWA) was amended to provide that the discharge of pollutants to waters of the United States from any point source is effectively prohibited unless the discharge is in compliance with a National Pollutant Discharge Elimination System (NPDES) permit.

On September 22, 1989, the United States Environmental Protection Agency (USEPA) granted the State of California, through the State Water Resources Control Board (State Water Board) and the Regional Water Quality Control Boards (Regional Water Boards), the authority to issue general NPDES permits pursuant to Title 40 of the *Code of Federal Regulations* (CFR) Parts 122 and 123.

Section 122.28 (40 CFR 122.28) provides for issuance of general permits to regulate a category of point sources if the sources involve the same or substantially similar types of operations, discharge the same type of waste, require the same type of effluent limitations or operating conditions, require similar monitoring, and would more appropriately be regulated under a *general* rather than an *individual* permit.

Individuals, public agencies, private business, and other legal entities occasionally need to discharge treated or untreated wastewaters directly into surface waters of the United States that pose an insignificant or minimal (i.e., low threat) to water quality. The activities that generate these low threat wastewaters are similar in that they generate wastewater flows that are similar in volume and quality. Therefore, the Regional Water Board considers it appropriate to issue General Waste Discharge Requirements (WDRs) and a General NPDES Permit for Dischargers of such flows.

## B. General Criteria

1. Individuals or entities proposing to discharge treated or untreated wastewaters containing little or no pollutants to waters of the United States must apply for coverage under this General Board Order **except** those whose discharges that are covered under other Regional Board or Statewide General Permit or individual permit.

This General Board Order is designed to cover low threat wastewater discharges to surface waters of the United States in the following activity categories:

- a. **Water System-Related Activities**<sup>1</sup>. This category includes discharges from water treatment (including water recycling) facilities, industries, and other entities that maintain and operate potable or non-potable water systems.

***Examples:***

- Maintenance and repairs to uncontaminated water supply wells, vessels, pipelines, tanks, reservoirs, and appurtenances;
- Hydrostatic testing (*see also item I.B.9 below*) of vessels, pipelines, tanks, reservoirs, and appurtenances (includes testing of newly constructed potable or non-potable pipelines, tanks, and vessels);
- Disinfection of wells, vessels, pipelines, tanks, reservoirs, and appurtenances;
- Discharges from water (including recycled water) systems resulting from designed or planned pressure releases, backwashing, flushing, or similar operational activities; and
- Fire hydrant testing or flushing.

- b. **Dewatering Activities**<sup>2</sup>. This category includes discharges from entities undertaking dewatering activities. *See also items I.B.3 through I.B.8 below.*

***Examples:***

- Treated or untreated groundwater from permanent or temporary dewatering operations to construct or protect pipelines and structures from groundwater infiltration or flotation; and
- Subterranean seepage dewatering, such as water extracted from crawl space pumps.

- c. **Groundwater Extraction Activities**<sup>3</sup>. This category includes discharges from entities that extract groundwater when investigating or cleaning up sites with soil and

---

<sup>1</sup> This General Board Order is not intended to cover releases to surface water from water systems used to transport and deliver surface water for groundwater replenishment, irrigation or other municipal, industrial or agricultural uses.

<sup>2</sup> This General Board Order is not intended to cover releases to surface water from subsurface drainage systems installed to reclaim lands for beneficial uses.

<sup>3</sup> This General Board Order is not intended to cover releases to surface waters from untreated groundwater wells when operated as drinking water sources.

groundwater pollution or as a result of drilling, constructing, developing, and purging wells. *See also items I.B.3 through I.B.8 below.*

**Examples:**

- Groundwater pumped as an aid in the containment and/or cleanup of a containment plume or groundwater from cleanup sites (except for volatile organic constituents (VOC) contaminated groundwater);
- Groundwater generated from well drilling, construction, and development purging of wells;
- Groundwater extracted during aquifer tests;
- Equipment wash water;
- Geothermal well testing; and
- Groundwater infiltration (e.g., seepage, foundation or footage drainage, and seawater infiltration).

- d. **Other Low Threat Discharge Activities.** This category includes discharges from public and private entities that engage in other miscellaneous activities.

**Examples:**

- Pilot treatment discharges (less than 2 years in duration and where water is removed, treated, and discharged into the same water body at points having similar water characteristics);
- Evaporative condensate (e.g., discharges associated with atmospheric condensates including refrigeration, air conditioners, compressor condensate, and cooling towers);
- Equipment washing and spill wash water;
- Discharges from drainage of swimming or ornamental pools, golf course lakes, and impounded water bodies<sup>4</sup>;
- Discharges that have same types of waste. Although they pose a low threat to water quality, they still require WDRs since they are not covered by other Statewide or Regional Water Board-wide General Orders or an individual permit.

2. This General Board Order is intended to cover individuals or entities that discharge low threat wastewaters to surface waters of the United States. Dischargers of low threat wastewaters to surface waters that have been enrolled for coverage and whose discharge is allowed under an existing individual permit, or State Water Board-wide or Regional Water Board-wide General Permit contained in Table F-1 are not required to apply for coverage under this General Board Order and may continue to discharge pursuant to the existing permit.

**Table F-1. Related State Water or Regional Water Board-Wide General Permits**

---

<sup>4</sup> For these types of water bodies discharges, a full characterization of the wastewater for presence of pesticides, priority pollutants, and or other chemicals that have been applied to the wastewater needs to be provided. There must be a demonstration that there are no pollutants present at levels of concern

| General Permit  | Water Quality Order No.<br>(NPDES General Permit No.) | Coverage   |
|---|---|--|
| WDRs for Discharges of Storm Water Associated with Construction Activity  | 99-08-DWQ (CAS000002)                                 | Statewide permit that applies to construction activities (clearing, grading, stockpiling, or excavation) that result in soil disturbances of at least 1 acres of total land.   |
| WDRs for Discharges of Storm Water Associated with Industrial Activities Excluding Construction Activities                      | 97-03-DWQ (CAS000001)                                 | Statewide permit that applies to new or existing industrial storm water discharges and authorized non-storm water discharges.  |
| WDRs for Storm Water Discharges from Small Municipal Separate Storm Sewer Systems (MS4s)  | 2003-0005-DWQ (CAS000004)                             | Statewide permit that applies to storm water discharges from small MS4s.   |
| WDRs for the State of California, Department of Transportation (Caltrans)   | 99-06-DWQ (CAS000003)                                 | Statewide permit that applies to municipal storm water activities by Caltrans, in areas that require a MS4 permit and in areas that do not require a permit. Also applies to all Caltrans construction activities that require a permit under federal regulations. |
| Treated Groundwater from Cleanup of Petroleum-related and Volatile Organic Compounds (VOCs) Regional Water Board General Permit | R7-2009-0400 (CAG917001)                              | Regional Water Board-wide permit that applies to discharges resulting from the cleanup of groundwater polluted by releases of petroleum related organic compounds and other VOCs associated with chemical releases.  |
| Statewide General NPDES Permit for Utility Vaults and Underground Structures  | 2006-0008-DWQ (CAG990002)                             | Statewide permit that applies to utility companies with short-term, intermittent discharges from utility vaults and underground structures.  |

3. The State Water Board adopted General Board Order No. 99-08-DWQ (NPDES Permit No. CAS000002) specifying WDRs for discharges of storm water associated with construction activities. Special Provision No. C.3 of General Board Order No. 99-08-DWQ also allows for the limited discharge of non-storm water discharges where such discharges do not cause or contribute to a violation of any water quality standard. Receiving water limitations in General Board Order No. 99-08-DWQ require compliance with all applicable water quality standards, including those contained in the *Water Quality Control Plan, Colorado River Basin* (hereinafter Basin Plan). Non-storm water discharges include, but are not limited to, (a) irrigation of vegetative erosion control measures; (b) pipe flushing and testing; (c) street cleaning; (d) dewatering; and (e) other miscellaneous discharges necessary for the completion of the construction project. The Regional Water Board finds that Statewide General Board Order No. 99-08-DWQ provides adequate water quality protection and compliance monitoring for the covered non-storm water discharges related to construction activities. Such discharges may continue to be regulated under General Board Order No. 99-08-DWQ.

4. The State Water Board adopted General Board Order No. 97-03-DWQ (NPDES Permit No. CAS000001) specifying WDRs for discharges of storm water associated with industrial activities, excluding construction activities, and some non-storm water discharges. Special Condition No. D.1 of General Board Order No. 97-03-DWQ authorizes such non-storm water discharges as (a) fire hydrant flushing; (b) potable water sources, including potable water related to the operation, maintenance, or testing of potable water systems; (c) drinking fountain water; (d) atmospheric condensates including refrigeration, air conditioners, and compressor condensate; (e) irrigation drainage; (f) landscape watering; (g) springs; (h) groundwater; (i) foundation or footage drainage; (j) sea water infiltration; and (k) discharges from fire fighting activities. General Board Order No. 97-03-DWQ further allows the Regional Water Board to establish additional monitoring and reporting requirements for these non-storm water discharges. The Regional Water Board finds that Statewide General Board Order No. 97-03-DWQ provides adequate water quality protection and compliance monitoring for the covered non-storm water discharges related to industrial activities. Such discharges may continue to be regulated under General Board Order No. 97-03-DWQ.
5. The State Water Board adopted General Board Order No. 2003-0005-DWQ (NPDES Permit No. CAS000004) specifying WDRs (Phase II storm water regulations) for discharges of storm water associated with small MS4s, and for limited discharges of non-storm water. Section D.2.c of General Board Order No. 2003-0005-DWQ authorizes such non-storm water discharges as (a) water line flushing; (b) landscape irrigation; (c) diverted stream flows; (d) rising ground waters; (e) uncontaminated ground water infiltration as defined at 40 CFR 35.2005, to separate storm sewers; (f) uncontaminated pumped ground water; (g) discharges from potable water sources; (h) foundation drains; (i) air conditioning condensation; (j) irrigation water; (k) springs; (l) water from crawl space pumps; (m) footing drains; (n) lawn watering; (o) individual residential car washing; (p) flows from riparian habitats and wetlands; and (q) dechlorinated swimming pool discharges. Discharges or flows from fire fighting activities are excluded from the effective prohibition against non-storm water and need only be addressed where they are identified as significant sources of pollutants to waters of the United States. General Board Order No. 2003-0005-DWQ allows the Regional Water Board to establish additional monitoring and reporting requirements for the non-storm water discharges. The Regional Water Board finds that Statewide General Board Order No. 2003-0005-DWQ provides adequate water quality protection and compliance monitoring for the covered non-storm water discharges related to MS4 activities. Such discharges may continue to be regulated under General Board Order No. 2003-0005-DWQ.
6. In 1999, the State Water Board adopted General Board Order No. 99-06-DWQ (NPDES Permit No. CAS000003) to cover all municipal storm water activities by Caltrans in California and all Caltrans construction activities in the state that require a permit under federal regulations. The Regional Water Board finds that General Order No. 99-06-DWQ provides adequate water quality protection and compliance monitoring for

covered low threat discharges. Such covered discharges may continue to be regulated under General Board Order No. 99-06-DWQ.

7. The Regional Water Board adopted General Board Order No. R7-2009-0400 (NPDES Permit No. CAG917001) on September 17, 2009 to regulate discharges of treated groundwater resulting from the cleanup of groundwater polluted by VOCs into surface waters. The Regional Water Board finds that General Board Order No. R7-2009-0400 provides adequate water quality protection and compliance monitoring for the applicable low threat discharges and that such discharges may continue to be regulated under that General Board Order or a subsequent updated General Board Order.
8. On July 19, 2006, the State Water Board adopted General Board Order No. 2006-0008-DWQ (NPDES Permit No. CAG990002) to regulate discharges from utility vaults and underground structures to surface waters. Utility companies include, but are not limited to, suppliers of natural gas, electricity, and telephone services. Utility companies with short-term, intermittent discharges from utility vaults and underground structures to surface water that do not cause, have the reasonable potential to cause, or contribute to an in-stream excursion above any applicable state of federal water quality objective / criteria or cause acute or chronic toxicity in the receiving water are authorized to discharge under the conditions set forth in the General Board Order. The Regional Water Board finds that General Board Order No. 2006-0008-DWQ provides adequate water quality protection and compliance monitoring for utility vault and underground structure discharges and that such discharges may continue to be regulated under that General Board Order.
9. On May 14, 1998 the Regional Water Board adopted General Board Order No. 98-300 (NPDES Permit No. CAG677001) to regulate discharges of hydrostatic test water to surface waters. The Regional Water Board recently rescinded this General Board Order via Board Order No. R7-2009-0029. Entities or individuals seeking to discharge hydrostatic test waters shall apply for coverage under this new General Board Order (R7-2009-0300).

## II. NOTIFICATION REQUIREMENTS

- A. General Permit Application Requirements.** Dischargers seeking coverage under this General Board Order shall submit the following information to the Regional Water Board: (1) Notice of Intent (NOI); (2) results of wastewater sampling; (3) proposed practices to comply with effluent limitations, if applicable; (4) Best Management Practices (BMP) Plan or Control Strategy Plan; (5) categorical exception data, if applicable; and (6) filing fee, plus applicable surcharge(s). Dischargers expecting to have multiple discharges over an established period need only submit one NOI but must specify in the NOI the project description, estimates of the number, frequency, rate and types of discharges expected to the receiving water body(ies). The Discharger's annual report as described in section X.E of the Monitoring and Reporting Program (Attachment E) shall provide information on the actual discharges.

- 1. Notice of Intent.** Dischargers eligible to seek coverage under this General Board Order shall submit to the Executive Officer a completed NOI, as detailed in Attachment C. The NOI requires the Discharger to submit the following information:
  - a. General project or facility information;
  - b. Indication of discharge type(s), discharge period(s) (duration), proposed rate of discharge(s), and whether the discharge(s) is/are continuous or intermittent;
  - c. Indication that the wastewater discharges from drainage of ornamental pools, golf course lakes, and impounded water do not contain pesticides, insecticides, biocides, and/or other chemicals that may have been applied to the wastewater;
  - d. Description of the discharge location;
  - e. Information concerning the receiving water body(ies);
  - f. Map (local and/or regional) showing project location(s), discharge points with latitude and longitude, the receiving waterbody with identifying information, and the location of any treatment or disposal systems;
  - g. A copy of the letter of acceptance or permit from the agency (e.g., municipality, water district, or other special district) responsible for the discharge location to allow the discharge into their drainage system, if applicable;
  - h. List of primary pollutants / parameters likely to be contained in the discharge(s);
  - i. Indication that a representative sample of the proposed effluent was taken and whether screening level for any parameter analyzed was exceeded;
  - j. Indication of ability to continuously comply with effluent limits and other requirements of the General Board Order;
  - k. Description of treatment or disposal system, BMPs, or other control strategies;
  - l. Categorical exception information (if applicable);
  - m. Explanation of why a discharge to surface water is the only feasible method for disposing of the effluent supported by a letter from the local publicly owned treatment works (POTW) stating that they cannot accept the discharge; and
  - n. The appropriate filing fee, plus applicable surcharge(s).
- 2. Sampling Requirements.** All Dischargers are required to analyze the proposed discharge for the priority pollutants regulated under the California Toxics Rule (CTR), which are specified in Attachment B, except for those dischargers approved for a categorical exception authorized by section 5.3 of the SIP. Dischargers may also be

required to analyze their discharges for a few conventional and non-conventional pollutants the Regional Water Board believes are likely to be present in low threat discharges regulated by this General Board Order. These pollutants are also listed in Attachment B. Dischargers of wastewater from water system-related activities and other low threat discharge activities must also sample for total residual chlorine (or dechlorinating agent). If the surface waterbody to receive the proposed direct discharge is impaired, as identified in the latest CWA section 303(d) List,<sup>5</sup> the Discharger shall also analyze for the constituent(s) causing the impairment(s). Finally, applicants proposing to discharge low threat wastewaters to specific waterbodies and waterbodies with certain beneficial use designations must also sample the effluent, upstream receiving water, and downstream receiving water for a few additional parameters specified in the *Water Quality Control Plan for the Colorado River Basin* (Basin Plan) and summarized in Attachment B.

Attachment B contains screening levels for priority pollutants with applicable water quality criteria. Since this General Board Order covers low threat discharges to all surface waters in the Colorado River Basin Region, the screening levels are based on the most restrictive water quality objectives / criteria. Dischargers who exceed a screening level for a priority pollutant, where they are provided in Attachment B, will not be eligible for coverage under this General Board Order and will need to apply for an individual NPDES permit.

Attachment B also contains screening levels for total residual chlorine for discharges from water system-related activities and other low threat discharge activities; pathogens for discharges to waterbodies designated as REC-I or REC-II, segments of the Colorado River designated as REC-I or REC-II, and the New River; and TSS for dischargers to the New River. Dischargers who exceed applicable screening levels or whose discharge appears to the Regional Water Board to have the potential to cause or contribute to an exceedance of a water quality standard will be subject to effluent limitations. The Executive Officer of the Regional Water Board will specify the effluent limitations as listed in section V. Effluent Limitations and Discharge Specifications of this permit to which the Discharger is subject in the Notice of Applicability (NOA).

If the results of analysis for a discharge to an impaired water body listed on the 303(d) List indicate that pollutant concentrations in the discharge have the reasonable potential to contribute to the impairment, the discharge will not be authorized by this General Board Order.

- 3. Proposed Approach to Comply.** Dischargers who exceed an applicable screening level in Attachment B, are required to indicate how they will comply with section V. Effluent Limitations and Discharge Specifications in the General Board Order for the applicable parameters, either through BMPs, or other control strategies.
- 4. Best Management Practices Plan or Control Strategy Plan.** To ensure that all enrollees are implementing practices to protect water quality, all Dischargers are

---

<sup>5</sup> The list of WQLSs may be found under the CWA section 303(d) List at [http://www.swrcb.ca.gov/water\\_issues/programs/tmdl/303d\\_lists2006\\_epa.shtml](http://www.swrcb.ca.gov/water_issues/programs/tmdl/303d_lists2006_epa.shtml).

required to develop and implement a BMP or Control Strategy Plan and have it available for inspection by the Regional Water Board. The elements of the Discharger's BMP Plan shall be consistent with the general guidance contained in the United States Environmental Protection Agency's (USEPA) *Guidance Manual for Developing Best Management Practices* (BMPs) (EPA 833-B-93-004). Dischargers may also consult the California Stormwater Best Management Practice Handbooks developed by the California Stormwater Quality Association, available at <http://www.cabmphandbooks.org/>, and other documents for guidance on addressing site-specific discharge situations. Dischargers exceeding the applicable screening levels for discharges from water system-related activities, hydrostatic test water discharges and other low threat discharge activities and screening levels for pathogens and TSS for discharges to specific waterbodies contained in Attachment B are required to submit the BMP or Control Strategy Plan with the NOI.

**5. Categorical Exceptions for Priority Pollutant Criteria and Objectives.** Section 5.3 of the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (State Implementation Policy or SIP) allows the Regional Water Board to allow certain Dischargers short-term or seasonal exceptions from meeting priority pollutant criteria and objectives for discharges that are necessary to implement control measures that fulfill statutory requirements regarding drinking water. Dischargers applying for a categorical exception to the priority pollutant criteria and objectives, as authorized by section 5.3 of the SIP, must notify potentially affected public and governmental agencies and must submit the following information with a completed NOI to the Regional Water Board:

- a. A detailed description of the proposed action, including the proposed method of completing the action;
- b. A time schedule;
- c. A discharge and receiving water quality monitoring plan (before project initiation, during the project, and after project completion, with the appropriate quality assurance and quality control procedures);
- d. CEQA documentation;
- e. Contingency plans;
- f. Identification of alternate water supply (if needed); and
- g. Residual waste disposal plans.

To prevent unnecessary delays in taking emergency actions or to expedite the approval process for expected or routine activities that fall under categorical exceptions, the Discharger is advised to file with the Regional Water Board, in advance of seeking Regional Water Board approval, the information required in items (a)-(g) above, to the extent possible.

The Regional Water Board will review the above submitted information and will determine whether the Discharger qualifies and meets the requirements in section 5.3 of the SIP for a categorical exception to the priority pollutant criteria. If no exception is granted, the Discharger will be required to analyze the proposed discharge for all of the CTR constituents listed in Tables B-2 and B-3 of Attachment B and submit the analytical test results to the Regional Water Board.

Upon Executive Officer determination that the Discharger has submitted the information necessary for qualification under section 5.3 of the SIP for a categorical exception to the priority pollutant criteria, the submitted information will be made available for public review and comment for 30 days.

- i. If there is no objection after the public review and comment period, the Executive Officer will issue an authorization letter to the Discharger making the approved application for categorical exception an enforceable part of the General Board Order.
- ii. If a written request for a hearing on the application for categorical exception is received within the 30-day public review and comment period, which includes the reason(s) the hearing is being requested (e.g., why the application for categorical exception is inadequate), the item will be placed on the next available Regional Water Board meeting agenda. Because of the need to comply with certain minimum noticing requirements, placement of this item on the agenda will be at least 30 days from the date when a hearing is requested plus the additional time necessary to follow the administrative procedures involved in preparing for the meeting.
- iii. If possible, the Regional Water Board staff will attempt to resolve the issues of concern by arranging a meeting with the applicant and the interested person(s) requesting the hearing. If an agreement is reached in the meeting, a hearing may not be required. If the agreement reached requires significant changes to be made to the submitted application, however, a new public notice and comment period will be required. If an agreement is not reached with the interested person(s) requesting the hearing, the hearing will proceed as scheduled. After testimony is taken at the hearing, the Regional Water Board will decide whether permit coverage shall commence or whether the submitted application for categorical exception needs to be revised.

**6. Filing Fee.** In addition to the material outlined in items II.A.1 through 5 above, Dischargers shall submit the current State Water Board adopted permit fee, plus applicable surcharge(s). Information concerning current annual permit fees may be found at <http://www.waterboards.ca.gov/resources/fees>.

**7. Application Period and Notice of Applicability.** Dischargers seeking coverage under this General Board Order shall file a completed NOI (with appropriate attachments) at least 45 days prior to the proposed discharge. Upon receipt of the NOI, the Executive

Officer shall determine the applicability of this General Board Order to the discharge. If the discharge is deemed eligible for coverage, the Executive Officer shall issue a NOA to the Discharger specifying whether the discharge is authorized under the terms and conditions of this General Board Order. Discharges shall not commence until after receiving the Executive Officer's written NOA or until the Regional Water Board has issued an individual NPDES permit for the discharge. The NOA will be written to apply to a project for those Dischargers that propose in their NOIs to have more than one discharge of the same type, rate, and duration to the same water body over an established time period.

## **B. Discharge Description**

Individuals and miscellaneous public and private entities often need to discharge clean or relatively pollutant-free wastewater. This wastewater poses an insignificant or minimal (i.e., *low threat*) to water quality. This General Board Order is designed to cover low threat discharges to surface waters of the United States.

## **C. Discharge Points and Receiving Waters**

There may be multiple discharge points and receiving waters under this General Board Order. Therefore, the Regional Water Board is requesting information regarding discharge points and receiving waters in the NOI. Agencies with multiple discharge points may submit a regional or service area map. Locations for discharges that are continuous for more than 24 hours will need to be provided in the NOI or in a supplemental letter. The Executive Officer will specify specific discharge points and receiving water information in each NOA.

## **D. Eligible Discharges**

This General Board Order covers discharges to surface waters within the Colorado River Basin Region of low threat wastewaters occurring in the following activity categories: (1) Water System-Related, (2) Dewatering, (3) Groundwater Extraction, and (4) Other. Section I.B of this Fact Sheet provides examples of specific activities within each of these categories.

To be authorized under this General Board Order, a Discharger must demonstrate the following:

1. Pollutant concentrations in the discharge shall not (i) cause, (ii) have the reasonable potential to cause, or (iii) contribute to an excursion above any applicable water quality objective;
2. A representative sample of the discharge does not exceed the screening levels contained in Attachment B or that the Discharger can comply with the effluent limitations for constituents contained in section V, Effluent limitations and Discharge Specifications;
3. The discharge does not include water added for the purpose of diluting pollutant concentrations; and

4. The Discharger is able to comply with all the terms and provisions of this General Board Order.

## E. Summary of Existing Requirements

This General Board Order is designed to cover low threat discharges to surface waters (see section I.B of this Fact Sheet for examples) to the extent the discharges are not already covered under an individual NPDES permit or other State Water Board or Regional Water Board-wide General Board Order (see Table F-1 under section I.B.2 above). As discussed under section I.B.9 of this Fact Sheet, General Board Order No. 98-300 covering the discharges of hydrostatic test waters to surface waters was rescinded on March 19, 2009 (Board Order No. R7-2009-0029). Going forward, dischargers of hydrostatic test waters shall apply for coverage under this proposed General Board Order (R7-2009-0300, NPDES Permit No. CAG997001).

The effluent limitations contained in General Board Order No. 98-300 are summarized in Table F-2 below and continued in this permit for hydrostatic test water discharges.

**Table F-2. Historic Effluent Limitations**

| Parameter                | Units          | Maximum Value |
|--------------------------|----------------|---------------|
| pH                       | standard units | 6.0 – 9.0     |
| Suspended Solids         | mg/L           | 95            |
| BOD <sub>5</sub> @ 20° C | mg/L           | 55            |
| Oil and Grease           | mg/L           | 25            |
| Turbidity                | NTU            | 75            |
| Settleable Solids        | ml/L           | 0.2           |
| Residual Chlorine        | mg/L           | 0.1           |

mg/L = milligrams per liter

NTU = Nephelometric Turbidity Units

ml/L = milliliters per liter

## III. APPLICABLE PLANS, POLICIES, AND REGULATIONS

The requirements contained in the proposed General Board Order are based on the requirements and authorities described in this section.

### A. Legal Authorities

This General Board Order is issued pursuant to section 402 of the federal CWA and implementing regulations adopted by USEPA and chapter 5.5, division 7 of the California Water Code (CWC), commencing with section 13370. It shall serve as a general NPDES permit for point source discharges of low threat wastewaters to surface waters. This

General Board Order also serves as WDRs pursuant to article 4, chapter 4, division 7 of the CWC, commencing with section 13260.

## **B. California Environmental Quality Act (CEQA)**

Under CWC section 13389, this action to adopt an NPDES permit is exempt from the provisions of Chapter 3 of CEQA, Public Resources Code, sections 21100 through 21177.

To satisfy the categorical exception requirements of section 5.3 of the SIP, Dischargers seeking enrollment under this General Board Order are required to submit project-specific information to the Executive Officer on the discharge and its water quality effects. This information is specified in section II.A.4 of this Fact Sheet and in Attachment C (NOI Form).

## **C. State and Federal Regulations, Policies, and Plans**

**1. Water Quality Control Plans.** The Regional Water Board adopted the Basin Plan on November 17, 1993 that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan (includes amendments adopted by the Regional Water Board to date). In addition, the Basin Plan implements State Water Board Resolution No. 88-63, which established state policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal or domestic supply. The existing and potential beneficial uses of the various surface waters that could be impacted by the discharge of low threat wastewaters in the Colorado River Basin Region include one or more of the following:

- Agricultural supply (AGR)
- Aquaculture (AQUA)
- Cold freshwater habitat (COLD)
- Freshwater replenishment (FRSH)
- Ground water recharge (GWR)
- Hydropower generation (POW)
- Industrial service supply (IND)
- Municipal and domestic supply (MUN)
- Non-contact water recreation (REC-II)
- Preservation of rare, threatened, or endangered species (RARE)
- Warm freshwater habitat (WARM)
- Water contact recreation (REC-I)
- Wildlife habitat (WILD)

Requirements of this General Board Order implement the Basin Plan.

**2. Thermal Plan.** The State Water Board adopted a Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Water and Enclosed Bays and Estuaries of California (Thermal Plan) on May 18, 1972 and amended this plan on September 18, 1975. This plan contains temperature objectives for surface waters. The Regional Water Board does not consider the low threat wastewaters regulated by this

General Board Order to contain thermal or elevated temperature wastes. Additionally, because agricultural drainage channels do not have a “natural” receiving water temperature, the Thermal Plan is not applicable to them. The channels comprise a significant number of receiving waterbodies in the Colorado River Basin. This General Board Order, therefore, does not implement the Thermal Plan.

- 3. National Toxics Rule (NTR) and California Toxics Rule (CTR).** USEPA adopted the NTR on December 22, 1992, and later amended it on May 4, 1995 and November 9, 1999. About 40 criteria in the NTR applied in California. On May 18, 2000, USEPA adopted the CTR. The CTR promulgated new toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. The CTR was amended on February 13, 2001. These rules contain water quality criteria for priority pollutants.
- 4. State Implementation Policy.** On March 2, 2000, the State Water Board adopted the SIP. The SIP became effective on April 28, 2000 with respect to the priority pollutant criteria promulgated for California by the USEPA through the NTR and to the priority pollutant objectives established by the Regional Water Board in the Basin Plan. The SIP became effective on May 18, 2000 with respect to the priority pollutant criteria promulgated by the USEPA through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005 that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for chronic toxicity control.

Section 5.3 of the SIP authorizes the Regional Water Board, after compliance with CEQA, to allow certain dischargers short-term or seasonal exceptions from meeting the priority pollutant criteria and objectives if the Regional Water Board determines the discharge is necessary to implement control measures regarding drinking water conducted to fulfill statutory requirements under the federal Safe Drinking Water Act or the California Health and Safety Code.

This General Board Order contains a process for Regional Board and public review for those Dischargers who submit the information required by section 5.3 of the SIP for categorical exception to the criteria and objectives in the CTR and SIP, as outlined in Attachment C.

In addition, as required by the SIP, Dischargers authorized to discharge under this General Board Order with a categorical exception to the priority pollutant criteria and objectives must provide certification by a qualified biologist that the receiving water beneficial uses have been restored upon cessation of the discharge and prior to termination of the permit. This General Board Order requires full compliance with the requirements of the CTR and SIP for all other authorized discharges. Requirements of this General Board Order implement the SIP.

- 5. Endangered Species Act.** This General Board Order does not authorize any act that results in the taking of a threatened or endangered species or any act that is now

prohibited, or becomes prohibited in the future, under either the California Endangered Species Act (California Fish and Game Code section 2050 to 2097) or the federal Endangered Species Act (16 U.S.C.A. Sections 1531 to 1544). This General Board Order requires compliance with effluent limits, receiving water limitations, and other requirements to protect the beneficial uses of waters of the state. The Discharger is responsible for meeting all applicable requirements of the Endangered Species Act.

6. **Alaska Rule.** On March 30, 2000, USEPA revised its regulation that specifies when new and revised state and tribal water quality standards (WQS) become effective for CWA purposes [40 CFR. 31.21, 65 Fed. Reg. 24641 (April 27, 2000)]. Under the revised regulation (also known as the Alaska rule), new and revised standards submitted to USEPA after May 30, 2000, must be approved by USEPA before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA by May 30, 2000, may be used for CWA purposes, whether or not approved by USEPA.
7. **Antidegradation Policy.** Section 131.12 (40 CFR 131.12) requires that state water quality standards include an antidegradation policy consistent with federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. The Basin Plan implements, and incorporates by reference, both the state and federal antidegradation policies. The permitted discharge must be consistent with the antidegradation provision of 40 CFR 131.12 and Resolution No. 68-16. As discussed in section IV.D.5 of this Fact Sheet, the discharge is consistent with the antidegradation provisions of 40 CFR 131.12 and State Water Board Resolution No. 68-16.
8. **Anti-Backsliding Requirements.** Sections 402(o)(2) and 303(d)(4) of the CWA and federal regulations at 40 CFR 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit must be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed. Compliance with the anti-backsliding requirements is discussed in section IV.D.6 of this Fact Sheet.

#### **D. Impaired Water Bodies on CWA 303(d) List**

Under section 303(d) of the CWA, states, territories, and authorized tribes are required to develop lists of water quality limited segments (WQLSs). The waters on these lists do not meet water quality standards, even after point sources of pollution have installed the minimum required levels of pollution control technology. On November 30, 2006, USEPA gave final approval to California's 2006 section 303(d) list of impaired waters (303(d) List). CWA section 303(d) further mandates that once waters are impaired by a particular constituent, the NPDES permitting authority is to develop total maximum daily loads (TMDLs) for the impaired water body. A TMDL is the maximum amount of pollution that a waterbody can assimilate without violating state water quality standards.

The 2006 303(d) List classifies the Imperial Valley Drains as impaired by five pesticides and one metal. Respectively, the pollutants include dieldrin, DDT, endosulfan, PCBs, toxaphene, and selenium. The Regional Water Board has not yet developed TMDLs for these parameters.<sup>6</sup> The Imperial Valley Drains had previously been listed as impaired for sedimentation / siltation. USEPA has approved a sedimentation / siltation TMDL for the Imperial Valley Drains. The TMDL requires discharges from point sources to not exceed the TSS limits and corresponding mass loading rates as specified at 40 CFR 122, *et seq.* It also requires monitoring for TSS during each discharge event. Imperial Valley Drains discharge to two major water bodies: the New River and the Alamo River.

The New River is listed as impaired by the following: (1) toxic organics (1,2,4-trimethylbenzene, 1,2-dichlorobenzene, chloroform, cymene, and toluene); (2) pesticides (chlordane, chlorpyrifos, DDT, diazinon, dieldrin, PCBs, and toxaphene); (3) xylenes (m,p-xylenes and o-xylenes); (4) metals (copper and mercury); (5) nutrients; (6) dissolved oxygen; (7) toxicity; and (8) trash. TMDLs for these various parameters are under development by the Regional Water Board. The New River is also listed as impaired for bacteria and sediment / siltation. USEPA has approved the Regional Water Board's TMDLs for these parameters. These TMDLs establish waste load allocations (WLAs) for fecal coliform, E. coli, enterococci, and sediment. The established receiving water limitations for fecal coliform, E. coli, enterococci, and TSS in this General Board Order comply with the WLAs established in the New River TMDLs. A Trash TMDL for the New River has been approved by the Regional Water Board and State Water Board, the Office of Administrative Law and USEPA. The TMDL essentially establishes a prohibition on the discharge of any trash to the New River by point sources. This General Board Order prohibits discharges of trash to the New River.

The Alamo River is listed as impaired by: (1) pesticides (chlorpyrifos, DDT, dieldrin, PCBs, and toxaphene); (2) metals (selenium); and (3) sediment / silt. USEPA has approved a sedimentation / siltation TMDL for the Alamo River. The requirements of this General Board Order are consistent with the WLAs contained in the sedimentation / siltation TMDL for the Alamo River.

The 303(d) List classifies segments of the Coachella Valley Storm Water Channel as impaired by pathogens and toxaphene. A TMDL has not yet been developed for toxaphene, but one is under development for pathogens.

The Colorado River (Imperial Reservoir to California-Mexico border) is listed as impaired for selenium (metal). The Palo Verde Outfall Drain and Lagoon is listed as impaired for pathogens and DDT (pesticide). TMDLs have not yet been developed for these parameters.

Finally, the Salton Sea is listed as impaired by: (1) nutrients, (2) salt, and (3) metals (selenium). No TMDLs have been developed to date for the Salton Sea, although a nutrient TMDL is under development. Tributaries to the Salton Sea, including the Coachella Valley Storm Channel and Imperial Valley Drains, may be affected by the

---

<sup>6</sup> The schedule for TMDL development may be found at  
[http://www.swrcb.ca.gov/water\\_issues/programs/tmdl/303d\\_lists2006\\_epa.shtml](http://www.swrcb.ca.gov/water_issues/programs/tmdl/303d_lists2006_epa.shtml).

nutrient TMDL and any others developed for the Salton Sea. Furthermore, the Basin Plan establishes selenium objectives for tributaries to the Salton Sea.

#### **E. Other Plans, Policies and Regulations – Not Applicable**

### **IV. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS**

Effluent limitations and toxic and pretreatment effluent standards established pursuant to sections 301 (effluent limitations), 302 (water quality related effluent limitations), 304 (information and guidelines), and 307 (toxic and pretreatment effluent standards) of the CWA and amendments thereto are applicable to discharges under this General Board Order.

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements via NPDES permits. There are two principal bases for effluent limitations in the *Code of Federal Regulations*: sections 122.44(a) and 122.44(d). Section 122.44(a) requires that permits include applicable technology-based limitations and standards, and section 122.44(d) requires that permits include water quality-based effluent limitations (WQBELs) to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water. Where receiving water has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, WQBELs may be established.

Effluent and receiving water limitations in this General Board Order are based on the federal CWA, Basin Plan, State Water Board's plans and policies, USEPA guidance and regulations, and best practicable waste treatment technology. While developing effluent limitations and receiving water limitations, monitoring requirements, and special conditions for the draft permit, the following information sources were used:

1. Title 40 of the *Code of Federal Regulations*;
2. Water Quality Control Plan (Colorado River Basin – Region 7) as amended to date;
3. General Board Order No. 98-300 (*NPDES Permit and General WDRs for Discharge of Hydrostatic Test Water to Surface Waters*); and
4. Other State Water Board-wide or Regional Water Board-wide General Orders regulating low threat discharges to surface waters.

#### **A. Discharge Prohibitions**

1. This General Board Order prohibits the following:
  - a. The discharge of treated wastewater at a location or in a manner different from that described by the Discharger in the NOI application or as authorized by the Executive Officer;

- b. The bypass or overflow of low threat wastewaters to waters of the United States, except as allowed under the Standard Provisions for NPDES permits (hereinafter Standard Provisions), which are included as Attachment D to this General Board Order;
- c. The Discharger from extracting, accepting, or treating waste in excess of the BMPs or Control Strategy Plan or disposal capacity of the system as specified in the Discharger's NOA from the Executive Officer;
- d. The discharge of wastes causing degradation of any water supply unless in compliance with Resolution No. 68-16;
- e. The treatment or disposal of wastes from the facility or project site that cause pollution or nuisance as defined in section 13050, subdivisions (l) and (m), respectively, of the California Water Code;
- f. The discharge of any substances in concentrations toxic to animal or plant life; and
- g. The discharge of trash to the New River.

These prohibitions are based on the requirements of the CWA, Basin Plan, State Water Board plans and policies, and USEPA guidance and regulations.

- 2. The discharge prohibitions contained in General Board Order No. 98-300 (*NPDES Permit and General WDRs for Discharge of Hydrostatic Test Water to Surface Waters*) are encompassed by the prohibitions outlined in section IV.A.1 above. Therefore, the prohibitions of Order No. 98-300 are carried forward in this General Board Order.

## **B. Technology-Based Effluent Limitations**

### **1. Scope and Authority**

Section 301(b) of the CWA and implementing USEPA permit regulations at 40 CFR 122.44 require that permits include conditions meeting applicable technology-based requirements at a minimum, and any more stringent effluent limitations necessary, to meet applicable water quality standards. The discharges authorized by this General Board Order must meet minimum federal technology-based requirements based on Best Professional Judgment (BPJ) in accordance with section 125.3.

The CWA requires that technology-based effluent limitations be established based on several levels of controls:

- a. Best practicable treatment control technology (BPT) represents the average of the best performance by plants within an industrial category or subcategory. BPT standards apply to toxic, conventional, and non-conventional pollutants.
- b. Best available technology economically achievable (BAT) represents the best existing performance of treatment technologies that are economically achievable

within an industrial point source category. BAT standards apply to toxic and non-conventional pollutants.

- c. Best conventional pollutant control technology (BCT) represents the control from existing industrial point sources of conventional pollutants including five-day biochemical oxygen demand (BOD<sub>5</sub>), TSS, fecal coliform, pH, and oil and grease. The BCT standard is established after considering the *cost reasonableness* of the relationship between the cost of attaining a reduction in effluent discharge and the benefits that would result, and also the cost effectiveness of additional industrial treatment beyond BPT.
- d. New source performance standards (NSPS) represent the best available demonstrated control technology standards. The intent of NSPS guidelines is to set limitations that represent state-of-the-art treatment technology for new sources.

The CWA requires USEPA to develop effluent limitations, guidelines and standards (ELGs) representing application of BPT, BAT, BCT, and NSPS. CWA section 402(a)(1) and 40 CFR 125.3 authorize the use of best professional judgment to derive technology-based effluent limitations on a case-by-case basis where ELGs are not available for certain industrial categories and/or pollutants of concern. Where BPJ is used, the permit writer must consider specific factors outlined in 40 CFR 125.3.

## **2. Applicable Technology-Based Effluent Limitations**

The low threat discharges authorized by this General Board Order are considered high-quality wastewaters that are relatively pollutant-free and pose a low threat to water quality. Because of the potential diversity of low threat discharges, this General Board Order does not establish technology-based effluent limitations based on any specific treatment technologies. According to 40 CFR 122.44(k), BMPs can be required in lieu of technology-based effluent limitations when numeric effluent limitations are infeasible. Therefore, based on BPJ, BMPs will serve as the equivalent of technology-based effluent limitations in order to carry out the purposes and intent of the CWA. All Dischargers under this General Board Order shall develop and implement a BMP or Control Strategy Plan and have it available for review by the Regional Water Board. The elements of the Discharger's BMP Plan shall be consistent with the general guidance contained in the United States Environmental Protection Agency's (USEPA) *Guidance Manual for Developing Best Management Practices* (BMPs) (EPA 833-B-93-004). Dischargers may also consult the California Stormwater Best Management Practice Handbooks developed by the California Stormwater Quality Association, available at <http://www.cabmphandbooks.org/>, and other documents for guidance on addressing site-specific discharge situations. Any Discharger that exceeds an applicable screening level in Attachment B is required to submit the BMP or Control Strategy Plan to the Regional Water Board with the completed NOI.

## C. Water Quality-Based Effluent Limitations (WQBELs)

### 1. Scope and Authority

Section 301(b) of the CWA and 40 CFR 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards.

Section 122.44(d)(1)(i) mandates that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, WQBELs must be established using: (1) USEPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in 40 CFR 122.44(d)(1)(vi).

The process for determining reasonable potential and calculating WQBELs, when necessary, is intended to protect the designated uses of the receiving water as specified in the Basin Plan. It is also intended to achieve applicable water quality objectives and criteria that are contained in other state plans and policies or in the CTR and NTR.

### 2. Applicable Beneficial Uses and Water Quality Criteria and Objectives

- a. **Receiving Waters.** Low threat wastewaters may potentially be discharged to all surface waters in the Colorado River Basin. The designated beneficial uses of surface waters throughout the Basin Region are summarized in section III.C.1 of this Fact Sheet.
- b. **Hardness.** While no effluent limitation for hardness is necessary in this General Board Order, hardness is critical to the assessment of reasonable potential for certain metals. The CTR, at section (c)(4), states the following:

“Application of metals criteria. (i) For purposes of calculating freshwater aquatic life criteria for metals from the equations in paragraph (b)(2) of this section, for waters with a hardness of 400 mg/L or less as calcium carbonate, the actual ambient hardness of the surface water *shall* be used in those equations.”  
[Emphasis added]

The State Water Board, in footnote 19 to Water Quality Order No. 2004-0013,<sup>7</sup> stated, “*We note that...the Regional Water Board...applied a variable hardness value whereby effluent limitations will vary depending on the actual, current*

---

<sup>7</sup> State of California, State Water Resources Control Board, Order WQO 2004-0013, *In the Matter of the Petition of Yuba City for Review of Waste Discharge Requirements Order No. R5-2003-0085 and Cease and Desist Order No. R5-2003-0086 Issued by the California Regional Water Quality Control Board, Central Valley Region, SWRCB/OCC FILE A-1580.*

*hardness values in the receiving water. We recommend that the Regional Water Board establish either fixed or seasonal effluent limitations for metals, as provided in the SIP, rather than 'floating' effluent limitations."*

This General Board Order does not authorize discharges that have the reasonable potential to exceed water quality objectives for priority pollutants. Therefore, screening levels must be set to protect the beneficial uses of the receiving water for all discharge conditions. In the absence of the option of including condition-dependent, "floating" screening levels that are reflective of actual conditions at the time of discharge, effluent limitations must be set using a reasonable worst-case condition in order to protect beneficial uses for all discharge conditions. Dependent on receiving water conditions, use of either the lowest observed effluent hardness or the lowest observed receiving water hardness may be more protective of aquatic life beneficial uses. For example, under effluent dominated discharge conditions, use of the lowest observed effluent hardness is the most protective.

This General Board Order includes screening levels for cadmium, chromium III, copper, lead, nickel, silver, and zinc, each of which is dependent on water hardness. The CTR expresses the objectives for these metals through equations where the hardness of the receiving water is a variable. To simplify the permitting process, it was necessary to use fixed hardness values in these equations. To calculate screening levels for waters with hardness concentrations less than 200 mg/L, a hardness value of 100 mg/L was used. To calculate screening levels for waters with hardness concentrations greater than or equal to 200 mg/L but less than 300 mg/L, a hardness value of 250 mg/L was used. To calculate screening levels for waters with hardness concentrations greater than or equal to 300 mg/L but less than 400 mg/L, a hardness value of 350 mg/L was used. Finally, to calculate screening levels for waters with hardness concentrations greater than or equal to 400 mg/L, a hardness value of 400 mg/L was used.

This General Board Order requires the Discharger to analyze the proposed effluent and the receiving water for hardness. The Discharger shall submit the analytical results with the NOI and propose an appropriate hardness concentration based on the analytical results and site-specific receiving water conditions. Upon approval of the Executive Officer, this hardness value will be used to determine the appropriate screening levels contained in Attachment B.

- c. Assimilative Capacity / Mixing Zone.** The effluent limitations for low threat discharges were calculated assuming no dilution. In general, the low threat discharges covered by this General Board Order do not flow directly into receiving waters with significant volume to consider a dilution credit or to allocate a mixing zone. Many creeks and streams in the Colorado River Basin Region are dry during the summer months. Therefore, for many months of the year, these discharges may represent all or nearly all of the flow in some portions of the receiving creeks or streams. Because this General Board Order is intended to serve as a General NPDES Permit and covers discharges to all surface waters in the Colorado River Basin, the effluent limitations established pursuant to this General Board Order are established to achieve the most protective water quality objective for the surface

water beneficial uses in the Colorado River Basin. Therefore, the Regional Water Board has assumed no assimilative capacity and, thus, has not granted any dilution credits.

An exception to this assumption may be applied based on the demonstration of a mixing zone in accordance with section 1.4.2 of the SIP and an approved mixing zone study demonstrating compliance with water quality objectives in the receiving water as prescribed in the Basin Plan. This exception process is more appropriate for an individual rather than a general board order. A general board order should be protective of the most stringent water quality objectives and beneficial uses. If a Discharger requests that a dilution credit be included in the computation of an effluent limitation or that a mixing zone be allowed, an individual order will be required. However, if no mixing zone is proposed, this General Board Order provides coverage for all low threat discharges to receiving waters in the Colorado River Basin Region.

### **3. Determining the Need for WQBELs**

- a. CWA section 301(b)(1) requires NPDES permits to include WQBELs if technology-based effluent limitations are not sufficiently stringent to meet applicable water quality criteria. Water quality standards include Regional Water Board Basin Plan beneficial uses and narrative and numeric water quality objectives, State Water Board adopted standards, and federal standards, including the CTR and NTR. The Basin Plan establishes narrative and numeric objectives for a variety of parameters or receiving water conditions for: (i) all waterbodies; (ii) specific beneficial uses; and (iii) specific waterbodies.
- b. Federal regulations require effluent limitations for all pollutants that are or may be discharged at a level that will cause or have the reasonable potential to cause, or contribute to an in-stream excursion above a narrative or numerical water quality standard.
- c. **All Low Threat Discharges**
  - i. **pH.** The Basin Plan includes a water quality objective for surface waters that *"Since the regional waters are somewhat alkaline, pH shall range from 6.0-9.0. Discharges shall not cause any changes in pH detrimental to beneficial uses."* Effluent Limitations for pH are included in this General Board Order for all low threat discharges based on the Basin Plan objectives for pH.
  - ii. **Priority Pollutants.** This General Board Order is not intended to regulate discharges that have the reasonable potential to exceed water quality standards for priority pollutants, which would be more appropriately regulated by an individual board order. Since this is a general board order for all low threat discharges to surface waters in the Colorado River Basin of California, this General Order establishes screening levels in Attachment B that are protective of beneficial uses under all discharge conditions and are based on the most protective water quality criteria for priority pollutants contained in the CTR.

Dischargers enrolling under this General Board Order are required to analyze the proposed discharge for constituents regulated under the CTR and submit the results as part of the NOI, except for those dischargers approved for a categorical exception authorized by section 5.3 of the SIP. If the analytical data demonstrate that any constituent concentrations in the discharge exceed the water quality screening levels listed in Attachment B, the discharge will not be allowed under this General Board Order. If all constituent concentrations are below the screening levels listed in Attachment B, the discharge will be authorized for coverage under this General Board Order.

Given the wide range of uses throughout the Colorado River Basin Region, this General Board Order establishes screening levels for discharges based on the beneficial uses of the receiving waters: (1) those where the receiving waters are designated to support domestic and municipal supply (MUN) and (2) those where the receiving waters are designated for all other uses except domestic and municipal supply (non-MUN). The screening levels for discharges to receiving waters designated as MUN are based on the more stringent of (1) human health water quality criteria based on consumption of water and organisms as contained in the CTR and (2) freshwater aquatic life water quality criteria as contained in the CTR. The screening levels for discharges to receiving waters designated as non-MUN are based on the more stringent of (1) human health water quality criteria based on consumption of organisms only as contained in the CTR and (2) freshwater aquatic life water quality criteria as contained in the CTR.

The Discharger is required to analyze a representative sample of the discharge. The Regional Water Board shall conduct a Reasonable Potential Analysis (RPA) of the priority pollutants in accordance with section 1.3, step 7, of the SIP by comparing the analytical results to the screening levels contained in Attachment B. If the analytical data demonstrate that constituent concentrations in the discharge exceed the water quality screening levels listed in Attachment B (Tables B-2 and B-3), the Discharger will not be covered by this General Board Order and will need to apply for an individual permit.

Several priority pollutants do not have CTR criteria. These pollutants include asbestos (non-MUN only), beryllium, chloroethane, 2-chloroethylvinyl ether, chloroform, 1,1-dichloroethane, methyl chloride, 1,1,1-trichloroethane, 2-nitrophenol, 4-nitrophenol, 3-methyl-4-chlorophenol, acenaphthylene, benzo(ghi)perylene, bis(2-chloroethoxy)methane, 4-bromophenyl phenyl ether, 4-chlorophenyl phenyl ether, 2,6-dinitrotoluene, di-n-octyl phthalate, naphthalene, phenanthrene, 1,2,4-trichlorobenzene, and delta-BHC. Due to the generally short-term and low volume nature of the discharges covered by this General Board Order and the lack of applicable criteria, screening levels for these pollutants are not established in this General Board Order.

**d. Discharges from Water System-Related Activities and Other Low Threat Discharge Activities**

- i. **Chlorine, Total Residual.** Discharges from water system-related activities and other low threat discharge activities may contain chlorine, which is extremely toxic to aquatic organisms. USEPA's *National Ambient Water Quality Criteria for the Protection of Freshwater Aquatic Life (NAWQC)* recommend 4-day average (chronic) and 1-hour average (acute) criteria for chlorine of 0.019 mg/L and 0.011 mg/L, respectively. Table B-5 of Attachment B contains a screening level of 0.011 mg/L for discharges from water system-related activities and other low threat discharge activities. Discharges that exceed the screening level for chlorine will be subject to effluent limitations, as specified in the NOA from the Executive Officer.

The Regional Water Board calculates effluent limitations for CTR and non-CTR parameters using the procedures outlined in the SIP and the USEPA *Technical Support Document for Water Quality-based Toxics Control* (EPA/505/2-90-001), which contain statistical methods for converting chronic (4-day) and acute (1-hour) aquatic life criteria to average monthly and maximum daily effluent limitations based on the variability of the existing data and the expected frequency of monitoring. However, because projects likely to be granted coverage under this General Board Order will typically be short in duration, reasonable potential exists for acute toxicity, and average 1-hour and 4-day limitations for chlorine are more appropriate than average monthly and maximum daily effluent limitation for such discharges. In order to protect the beneficial uses of the receiving waters throughout the Colorado River Basin Region, this General Board Order establishes an average 1-hour effluent limitation of 0.019 mg/L and an average 4-day effluent limitation of 0.011 mg/L for chlorine for discharges from water system-related activities and other low threat discharge activities.

Regional Water Board General Order No. 98-300 established an effluent limitation for total residual chlorine of 0.1 mg/L as a maximum. Based on the rationale above, the Regional Water Board is revising the effluent limitation to be consistent with the NAWQC, resulting in more stringent effluent limitations.

The San Francisco Regional Water Board included a reporting level of 0.08 mg/L to determine compliance with the effluent limitations contained in the General Order for Discharges from Surface Water Treatment Facilities for Potable Supply (Order No. R2-2003-0062, NPDES No. CAG382001). The reporting level of 0.08 mg/L represents a level that handheld field meters are capable of achieving. The Regional Water Board concurs with the approach used by the San Francisco Regional Water Board. Therefore, this Order requires Dischargers to use a method capable of achieving a reporting level of 0.08 mg/L, consistent with the reporting level required by the San Francisco Regional Water Board, until the State Water Board adopts a statewide policy with a specified reporting level achievable in the field and laboratory. A reopener provision has been included in

this General Board Order that will allow the Regional Water Board to reopen and modify the permit if a statewide policy for total residual chlorine takes effect.

- e. **Hydrostatic Test Water Discharges and Dewatering Activities.** This General Board Order carries forward the effluent limitations set in the previous General Board Order 98-300 for hydrostatic test water discharges.

An effluent limitation for Total Petroleum Hydrocarbons has been added for activities where diesel or gasoline powered generator is used in dewatering activities.

- f. **Low Threat Discharges to Specific Waterbodies.** The Basin Plan establishes water quality objectives for E. coli in waterbodies designated as REC-I or REC-II and segments of the Colorado River designated as REC-I or REC-II. The Basin Plan also contains waste load allocations (WLAs) for E. coli, enterococci, and fecal coliform organisms and TSS applicable to discharges to the New River based on the New River Pathogen TMDL and the New River Sedimentation/Siltation TMDL. All applicants proposing to discharge to one of the applicable receiving waters shall sample their effluent for the identified parameters as specified in Attachment B. If the analytical data demonstrate that constituent concentrations in the discharge exceed the water quality screening levels listed in Tables B-8 through B-10 of Attachment B, or appear to cause or contribute to an exceedance of a water quality standard in the receiving water, the Discharger shall submit their plan for compliance and a BMP or Control Strategy Plan with the NOI demonstrating how the Discharger will comply with the effluent limitations in this General Board Order. The Executive Officer will specify the effluent limitations applicable to a Discharger in the NOA.
- i. **Discharges to Waters Designated as REC-I.** The Basin Plan contains a water quality objective that specifies that the geometric mean bacterial density for E. coli (based on a minimum of not less than five samples equally spaced over a 30-day period) shall not exceed 126 Most Probable Number (MPN) per 100 milliliters (mL), nor shall any sample exceed the maximum allowable bacterial density of 400 MPN/100 mL in waters designated as REC-I. Effluent limitations for E. coli for discharges to waters designated as REC-I are included in this General Board Order based on Basin Plan objectives. A screening level of 126 MPN/100 mL is included in Attachment B.
- ii. **Discharges to Waters Designated as REC-II.** The Basin Plan specifies that the geometric mean bacterial density for E. coli (based on a minimum of not less than five samples equally spaced over a 30-day period) shall not exceed 630 MPN/100 mL, nor shall any sample exceed the maximum allowable bacterial density of 2,000 MPN/100 mL in waters designated as REC-II. Effluent limitations for E. coli for discharges to waters designated as REC-II are included in this General Board Order based on Basin Plan objectives. A screening level of 630 MPN/100 mL is included in Attachment B.
- iii. **Discharges to Segments of the Colorado River Designated as REC-I.** The Basin Plan specifies that the geometric mean bacterial density for E. coli (based on a minimum of not less than five samples equally spaced over a 30-day period)

shall not exceed 126 MPN/100 mL, nor shall any sample exceed the maximum allowable bacterial density of 235 MPN/100 mL in segments of the Colorado River designated as REC-I. Effluent limitations for *E. coli* for discharges to segments of the Colorado River designated as REC-I are included in this General Board Order based on Basin Plan objectives. A screening level of 126 MPN/100 mL is included in Attachment B.

- iv. Discharges to Segments of the Colorado River Designated as REC-II.** The Basin Plan specifies that the geometric mean bacterial density for *E. coli* (based on a minimum of not less than five samples equally spaced over a 30-day period) shall not exceed 630 MPN/100 mL, nor shall any sample exceed the maximum allowable bacterial density of 1,175 MPN/100 mL in segments of the Colorado River designated as REC-II. Effluent limitations for *E. coli* for discharges to segments of the Colorado River designated as REC-II are included in this General Board Order based on Basin Plan objectives. A screening level of 630 MPN/100 mL is included in Attachment B.
- v. Discharges to the New River.** The New River Pathogen TMDL contained in the Basin Plan specifies that the geometric mean bacterial density for *E. coli* (based on a minimum of not less than five samples equally spaced over a 30-day period) shall not exceed 126 MPN/100 mL, nor shall any sample exceed the maximum allowable bacterial density of 400 MPN/100 mL; the geometric mean bacterial density for enterococci (based on a minimum of not less than five samples equally spaced over a 30-day period) shall not exceed 33 MPN/100 mL, nor shall any sample exceed the maximum allowable bacterial density of 100 MPN/100 mL; and that the geometric mean bacterial density for fecal coliform (based on a minimum of not less than five samples equally spaced over a 30-day period) shall not exceed 200 MPN/100 mL, nor shall more than 10 percent of the total samples during any 30-day period exceed 400 MPN/100 mL for discharges to the New River. The New River Sedimentation/Siltation TMDL contained in the Basin Plan specifies that the concentration of TSS in the New River shall not exceed 200 mg/L as an annual average. Since the TSS effluent limitation is 95 mg/L for the hydrostatic test water discharge, this TSS effluent limitation will also be in effect for the New River. Effluent limitations for *E. coli*, enterococci, fecal coliform organisms, and TSS for discharges to the New River are included in this General Board Order based on the TMDLs contained in the Basin Plan. Screening levels for *E. coli*, enterococci, fecal coliform organisms, and TSS are been included in Attachment B.

#### **4. WQBEL Calculations**

- a.** The effluent limitations for total chlorine residual are based on the Basin Plan's narrative toxicity objective and are applied directly as 4-day and 1-hour average effluent limitations, as discussed in section IV.C.3.d of this Fact Sheet. The effluent limitations for pH are based on the Basin Plan's specific objectives for pH and are applied in this General Board Order as instantaneous effluent limitations.

- b. The effluent limitations based on waterbody specific objectives and TMDLs in the Basin Plan, as presented in section IV.C.3.e above, are applied as specified in the Basin Plan.

## **5. Whole Effluent Toxicity (WET)**

Whole effluent toxicity protects the receiving water quality from the aggregate toxic effect of a mixture of pollutants in the effluent. WET tests measure the degree of response of exposed aquatic test organisms to an effluent. The WET approach allows for protection of the narrative “no toxics in toxic amounts” criterion while implementing numeric criteria for toxicity. There are two types of WET tests: acute and chronic. An acute toxicity test is conducted over a shorter time period and measures mortality. A chronic toxicity test is conducted over a longer period of time and measures mortality, reproduction, and growth.

The Basin Plan specifies a narrative objective for toxicity, requiring that all waters be maintained free of toxic substances in concentrations that are lethal to or produce other detrimental response on aquatic organisms. Detrimental responses include, but are not limited to, decreased growth rate; decreased reproductive success of resident or indicator species; and/or significant alterations in population, community ecology, or receiving water biota.

The discharges authorized by this General Board Order pose a low threat to water quality. Because the discharges authorized by this General Board Order are generally low volume and/or short-term in nature and are not expected to contribute to acute or chronic toxicity, effluent limitations for acute and chronic toxicity and requirements for acute and chronic WET testing are not specified by this General Board Order.

## **D. Final Effluent Limitations**

### **1. Mass-based Effluent Limitations – Not Applicable**

- 2. **Averaging Periods for Concentration-based Effluent Limitations.** Section 122.45(d) [40 CFR 122.45(d)] requires maximum daily and average monthly discharge limitations for all dischargers other than publicly owned treatment works (POTWs) unless impracticable. The Basin Plan objectives for pH and pathogens and the waste load allocations in TMDLs for pathogens and TSS in the New River have been established directly as effluent limitations. The rationale for using alternative averaging periods for chlorine residual is discussed in section IV.C.3.d.i of this Fact Sheet.

### **3. Final Effluent Limitations**

#### **a. Final Effluent Limitations – Applicable to All Low Threat Discharges**

- i. **pH.** The hydrogen ion (pH) of the treated effluent shall be maintained within the limits of 6.0 to 9.0 standard units.

**b. Final Effluent Limitations – Applicable to Discharges from Water System-Related Activities and Other Low Threat Discharge Activities**

- i. **Chlorine, Total Residual.** The effluent limitations in Table F-3 may be applied to low threat wastewaters discharged to surface waters from water system-related activities and other low threat discharge activities in the Colorado River Basin Region. The effluent limitations applicable to a given Discharger will be specified in the NOA from the Executive Officer.

**Table F-3. Summary of Final Effluent Limitations for Total Residual Chlorine**

| Parameter                | Units | 1-Hour Average | 4-Day Average | Basis <sup>1</sup> |
|--------------------------|-------|----------------|---------------|--------------------|
| Chlorine, Total Residual | mg/L  | 0.019          | 0.011         | BP, NAWQC          |

<sup>1</sup> BP = Basin Plan

<sup>2</sup> NAWQC = National Ambient Water Quality Criteria for the protection of freshwater aquatic life

**c. Final Effluent Limitations – Applicable to Hydrostatic Test Water Discharges**

- i. **TSS, BOD, Oil and Grease, Turbidity, Settleable Solids, TPH and TRC.** The effluent limitations in Table F-4 may be applied to low threat wastewater discharged to surface waters from hydrostatic test water discharges in the Colorado River Basin Region. The effluent limitations applicable to a given Discharger will be specified in the NOA from the Executive Officer.

**Table F-4. Summary of Final Effluent Limitations for Hydrostatic Test Water Activities**

| Parameter  | Units | Effluent Limitations                                   |
|--|-------|--|
| Suspended Solids, Total                                  | mg/L  | 95   |
| BOD <sub>5</sub> @ 20° C or<br>CBOD <sub>5</sub> @ 20° C | mg/L  | 55 for BOD <sub>5</sub> or<br>50 for CBOD <sub>5</sub> |
| Oil and Grease   | mg/L  | 25   |
| Turbidity  | NTU   | 75   |
| Settleable Solids  | ml/L  | 0.2  |
| Total Petroleum Hydrocarbons                             | mg/L  | 0.1  |
| Chlorine Total Residual                                  | mg/L  | See Table F-3  |

**d. Final Effluent Limitations – Applicable to Discharges to Specific Waterbodies**

- i. **Discharges to Waters Designated as REC-I.** In addition to the effluent limitations identified in section IV.D.3.a through c above, Dischargers that discharge to waterbodies designated as REC-I that exceed the screening level for E. coli contained in Table B-8 of Attachment B shall be subject to the following effluent limitations. The effluent limitations applicable to a given Discharger will be specified in the NOA from the Executive Officer.

- (a) **E. coli.** The geometric mean bacterial density (based on a minimum of not less than five samples equally spaced over a 30-day period) shall not exceed

a MPN of 126/100 mL, nor shall any sample exceed the maximum allowable bacterial density of a MPN of 400/100 mL.

- ii. **Discharges to Waters Designated as REC-II.** In addition to the effluent limitations identified in section IV.D.3.a through c above, Dischargers that discharge to waterbodies designated as REC-II that exceed the screening level for E. coli contained in Table B-9 of Attachment B shall be subject to the following effluent limitations. The effluent limitations applicable to a given Discharger will be specified in the NOA from the Executive Officer.

(a) **E. coli.** The geometric mean bacterial density (based on a minimum of not less than five samples equally spaced over a 30-day period) shall not exceed a MPN of 630/100 mL, nor shall any sample exceed the maximum allowable bacterial density of a MPN of 2,000/100 mL.

- iii. **Discharges to Segments of the Colorado River Designated as REC-I.** In addition to the effluent limitations identified in section IV.D.3.a through c above, Dischargers that discharge to segments of the Colorado River designated as REC-I that exceed the screening level for E. coli contained in Table B-8 of Attachment B shall be subject to the following effluent limitations. The effluent limitations applicable to a given Discharger will be specified in the NOA from the Executive Officer.

(a) **E. coli.** The geometric mean bacterial density (based on a minimum of not less than five samples equally spaced over a 30-day period) shall not exceed 126 MPN/100 mL, nor shall any sample exceed the maximum allowable bacterial density of a MPN of 235/100 mL.

- iv. **Discharges to Segments of the Colorado River Designated as REC-II.** In addition to the effluent limitations identified in section IV.D.3.a through c above, Dischargers that discharge to segments of the Colorado River designated as REC-II that exceed the screening level for E. coli contained in Table B-9 of Attachment B shall be subject to the following effluent limitations. The effluent limitations applicable to a given Discharger will be specified in the NOA from the Executive Officer.

(a) **E. coli.** The geometric mean bacterial density (based on a minimum of not less than five samples equally spaced over a 30-day period) shall not exceed a MPN of 630/100 mL, nor shall any sample exceed the maximum allowable bacterial density of a MPN of 1,175/100 mL.

- v. **Discharges to the New River.** In addition to the effluent limitations identified in section IV.D.3.a through c above, Dischargers that discharge to the New River that exceed a screening level(s) for E. coli, enterococci, fecal coliform organisms, or TSS contained in Table B-10 of Attachment B shall be subject to the following

effluent limitations. The effluent limitations applicable to a given Discharger will be specified in the NOA from the Executive Officer.

**(a) Pathogens**

- (1) E. Coli.** The geometric mean bacterial density (based on a minimum of not less than five samples equally spaced over a 30-day period) shall not exceed a MPN of 126/100 mL, nor shall any sample exceed the maximum allowable bacterial density of a MPN of 400/100 mL.
- (2) Enterococci.** The geometric mean bacterial density (based on a minimum of not less than five samples equally spaced over a 30-day period) shall not exceed a MPN of 33/100 mL, nor shall any sample exceed the maximum allowable bacterial density of a MPN of 100/100 mL.
- (3) Fecal Coliform.** The geometric mean bacterial density (based on a minimum of not less than five samples equally spaced over a 30-day period) shall not exceed a MPN of 200/100 mL, nor shall more than ten percent of the total samples during any 30-day period exceed a MPN of 400/100 mL.

**(b) Total Suspended Solids.** The annual average effluent concentration of total suspended solids in the effluent shall not exceed 200 mg/L<sup>8</sup>.

- 4. Satisfaction of Anti-Backsliding Requirements.** Sections 402(o)(2) and 303(d)(4) of the CWA and the federal regulations at 40 CFR 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit be as stringent as those in the previous permit, with some exceptions.

Discharges of hydrostatic test water that were previously authorized under Regional Board General Order No. 98-300, which was rescinded on March 19, 2009, may be authorized to discharge under this General Board Order. General Board Order No. 98-300 established effluent limitations for TSS, BOD<sub>5</sub>, oil and grease, turbidity, settleable solids, and total residual chlorine. Effluent limitations for these parameters have been retained in this General Board Order. The discharges authorized by this General Board Order are low threat, high quality wastewaters and are not expected to negatively impact receiving water quality. This General Board Order requires Dischargers to analyze the discharge for conventional, non-conventional, and priority pollutants and submit the results with the NOI. If, based on sampling results, the Regional Water Board finds that concentrations of any of these parameters threaten to negatively impact receiving water quality, then authorization for coverage under this General Board Order will be denied and coverage under an individual permit will be required. This General Board Order also requires Discharger's to develop and implement a BMP or Control Strategy Plan to control or abate the discharge of pollutants. The requirements of this General Board Order are protective of all water quality objectives.

---

<sup>8</sup> The TSS effluent limitation of 95 mg/L for TSS from hydrostatic test water discharges is more stringent and shall be in effect.

## **5. Satisfaction of Antidegradation Policy**

The federal regulations at 40 CFR 131.12 require that the state water quality standards include an anti-degradation policy consistent with federal policy. The State Water Board established California's anti-degradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal anti-degradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. The Regional Water Board's Basin Plan implements, and incorporates by reference, both the state and federal anti-degradation policies. The permitted discharge is consistent with the anti-degradation provision of 40 CFR 131.12 and State Water Board Resolution No. 68-16. The Regional Water Board expects impacts to water quality to be insignificant based on the discharge types authorized under this General Permit. This General Board Order requires all Dischargers to screen for the presence of commonly-occurring conventional and non-conventional pollutants and for toxic priority pollutants as required by the SIP, , except for those dischargers approved for a categorical exception authorized by section 5.3 of the SIP. Based the results of these analyses, the Regional Water Board will determine coverage under this General Board Order, and establish effluent limitations, if applicable, on a Discharger-specific basis. This General Board Order also requires Dischargers to have in place a BMP Plan with specified components. Those Dischargers that exceed one or more screening levels for conventional and/or non-conventional pollutants in Attachment B are further required to summarize their ability to comply with effluent limitations for those parameters in the NOI. Those Dischargers that exceed one or more screening levels for priority pollutants in Attachment B will not be enrolled under this General Board Order, but will need to apply for an individual permit.

### **E. Interim Effluent Limitations – Not Applicable**

### **F. Land Discharge Specifications – Not Applicable**

### **G. Reclamation Specifications – Not Applicable**

## **V. RATIONALE FOR RECEIVING WATER LIMITATIONS**

### **A. Surface Water Limitations – Applicable to All Low Threat Discharges**

Receiving water limitations are based on the water quality objectives contained in the Basin Plan and are a required part of this General Board Order. All low threat discharges to any receiving water of the Colorado River Basin Region shall not:

1. Result in the concentration of dissolved oxygen in the receiving water to fall below 5.0 mg/L. When dissolved oxygen in the receiving water is already below 5.0 mg/L, the discharge shall not cause any further depression.
2. Result in the presence of oil, grease, floating material (liquids, solids, foam, and scum) or suspended material in amounts that create a nuisance or adversely affect beneficial uses.

3. Result in the deposition of pesticides or combination of pesticides detectable in concentrations that adversely affects beneficial uses.
4. Result in discoloration in the receiving water that adversely affects beneficial uses.
5. Result in the discharge of biostimulatory substances in concentrations that promote aquatic growths to the extent that such growths cause nuisance or adversely affect beneficial uses.
6. Result in an increase of turbidity that adversely affects beneficial uses.
7. Result in the normal ambient pH of the receiving water to fall below 6.0 or exceed 9.0 standard units.
8. Result in altering the natural receiving water temperature that adversely affects beneficial uses.
9. Result in the deposition of material that causes nuisance or adversely affects beneficial uses.
10. Result in the discharge of an individual chemical or combination of chemicals in concentrations that adversely affect beneficial uses.
11. Result in toxic pollutants to be present in the water column, sediments, or biota in concentrations that adversely affect beneficial uses or that produce detrimental physiological responses in human, plant, animal, or aquatic life.
12. Result in an increase in taste or odor-producing substances that adversely affect beneficial uses.
13. Result in the violation of any applicable water quality standard for receiving waters adopted by the Regional Water Board or the State Water Board as required by the federal CWA and regulations adopted thereunder. If more stringent applicable water quality standards are promulgated or approved pursuant to CWA section 303 or amendments thereto, the Regional Water Board will revise and modify this General Board Order in accordance with the stricter standards.

#### **B. Surface Water Limitations – Applicable to Discharges to Specific Waterbodies**

Receiving water limitations to specific waterbodies are based upon the water quality objectives contained in the Basin Plan and are a required part of this General Board Order. The waterbody-specific limitations are summarized below:

1. Discharges to the New River, Alamo River, and the Imperial Valley Drains shall not exceed an annual average of 4,000 mg/L and a daily maximum of 4,500 mg/L of TDS.
2. Discharges to the Coachella Valley and the Palo Verde Valley Drains shall not exceed an annual average of 2,000 mg/L and a daily maximum of 2,500 mg/L of TDS.

### **C. Groundwater Limitations – Not Applicable**

## **VI. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS**

Section 122.48 of Title 40 of the CFR requires that all NPDES permits specify requirements for recording and reporting monitoring results. CWC sections 13267 and 13383 authorize the Regional Water Board to require technical and monitoring reports. The Monitoring and Reporting Program (MRP), Attachment E of this General Board Order, establishes monitoring and reporting requirements to implement federal and state requirements. The following provides the rationale for the monitoring and reporting requirements contained in the MRP for this facility.

### **A. Influent Monitoring – Not Applicable**

### **B. Effluent Monitoring**

The Discharger is required to conduct monitoring of the permitted discharges in order to evaluate compliance with permit conditions. Monitoring requirements are given in the proposed MRP. This provision requires compliance with the Monitoring and Reporting Program, and is based on Sections 122.44(i), 122.62, 122.63 and 124.5. The MRP is a standard requirement in almost all NPDES permits (including the proposed General Board Order) issued by the Regional Water Board. In addition to containing definitions of terms, it specifies general sampling/analytical protocols and the requirements of reporting of spills, violations, and routine monitoring data in accordance with NPDES regulations, the CWC, and Regional Water Board's policies. It defines the sampling stations and frequency, pollutants to be monitored, and additional reporting requirements.

The effluent monitoring requirements have been established as follows:

1. General Board Order No. 98-300 for discharges of hydrostatic test water required monitoring once per discharge event for TSS, BOD<sub>5</sub>, oil and grease, turbidity, settleable solids and total residual chlorine. General Board Order No. 98-300 also required daily monitoring for temperature and dissolved oxygen. The monitoring requirements have been carried forward in this permit, monitoring frequencies may be adjusted by the Executive Officer to a less frequent basis if a Discharger makes a request and the request is backed by statistical trends of monitoring data submitted. The Executive Officer shall specify the monitoring frequency for these parameters in the NOA.
2. This General Board Order requires monitoring once per discharge for flow, fecal coliform organisms, pH, TSS, turbidity, settleable solids, enterococci, E. coli, Oil and Grease, TPH and TDS to characterize the effluent and determine compliance with effluent limitations, if applicable. Monitoring for priority pollutants is required yearly, except for those dischargers approved for a categorical exception authorized by section 5.3 of the SIP. Monitoring for flow and pH shall be performed daily. Since discharges from direct water releases do not exceed the water quality goals, discharges from potable water releases that do not exceed screening criteria do not need to monitor for constituents as listed in the Monitoring and Reporting Program. Monitoring frequencies may be adjusted by the Executive Officer to a less frequent basis if a Discharger makes

a request and the request is backed by statistical trends of monitoring data submitted. The Executive Officer shall specify the monitoring frequency for these parameters in the NOA.

3. For discharges that exceed the screening level for total residual chlorine contained in Attachment B, the monitoring frequency will be once per discharge. As discussed in section IV.C.3.d.i of this Fact Sheet, the Regional Water Board acknowledges the complications of achieving relatively low reporting levels in field locations. This General Board Order allows Dischargers to use handheld monitoring devices to monitor total residual chlorine in the effluent. This General Board Order also requires dischargers to utilize a method capable of achieving a reporting level of 0.08 mg/L until the State Water Board adopts a state-wide policy with a specified reporting level achievable in the field and laboratory. The reporting level of 0.08 mg/L represents a level that hand-held field meters are capable of achieving. Monitoring frequencies may be adjusted by the Executive Officer to a less frequent basis if a Discharger makes a request and the request is backed by statistical trends of monitoring data submitted. The Executive Officer shall specify the monitoring frequency for these parameters in the NOA

## **C. Whole Effluent Toxicity Testing Requirements**

The discharges authorized by this General Board Order have a low threat to water quality. They are low volume and/or short-term in nature and are not expected to contribute to acute or chronic toxicity; therefore, effluent limitations for acute and chronic toxicity and requirements for acute and chronic WET testing are not required by this General Board Order.

## **D. Receiving Water Monitoring**

### **1. Surface Water**

Surface water monitoring once per discharge is required to determine compliance with receiving water limitations and to characterize the water quality of the receiving water pursuant to the Basin Plan. Upstream and downstream receiving water monitoring frequencies for dissolved oxygen, TDS, pH, and temperature, shall be specified in the NOA from the Executive Officer. Since discharges from direct water releases do not exceed the water quality goals, discharges from potable water releases that do not exceed screening criteria do not need to monitor for these constituents. Monitoring frequencies may be adjusted by the Executive Officer to a less frequent basis if a Discharger makes a request and the request is backed by statistical trends of monitoring data submitted.

### **2. Groundwater – Not Applicable**

## **E. Other Monitoring Requirements**

1. **Annual Report.** Dischargers enrolled under this General Board Order are required to submit an annual report including current contact information and the status of updates to the Discharger's BMP or Control Strategy Plan. Dischargers having multiple

discharges of the same type, rate, and duration, and into the same receiving water must report on the number, frequency, rate, types of discharges, and date/time of actual discharges in the annual report.

## VII. RATIONALE FOR PROVISIONS

### A. Standard Provisions

Standard Provisions, which apply to all NPDES permits in accordance with 40 CFR 122.41, and additional conditions applicable to specified categories of permits in accordance with 40 CFR 122.42, are provided in Attachment D. The Discharger must comply with all standard provisions and with those additional conditions that are applicable under section 122.42.

Sections 122.41(a)(1) and (b) through (n) establish conditions that apply to all state-issued NPDES permits. These conditions must be incorporated into the permits either expressly or by reference. If incorporated by reference, a specific citation to the regulations must be included in the General Board Order. Section 123.25(a)(12) allows the state to omit or modify conditions to impose more stringent requirements. In accordance with 40 CFR 123.25, this General Board Order omits federal conditions that address enforcement authority specified in sections 40 CFR 122.41(j)(5) and (k)(2) because the enforcement authority under the CWC is more stringent. In lieu of these conditions, this General Board Order incorporates by reference CWC section 13387(e).

### B. Special Provisions

#### 1. Reopener Provisions

- a. **General.** Pursuant to 40 CFR Part 123, the Regional Water Board may reopen this General Board Order to modify conditions and requirements due to the promulgation of new regulations or the adoption of new regulations by the State Water Board or Regional Water Board, including revisions to the Basin Plan.
- b. **Total Residual Chlorine.** The State Water Board has developed the Draft Policy on Total Residual Chlorine and Chlorine-Produced Oxidants (TRC/CPO Draft Policy), which, when adopted, is intended to establish consistent standards and implementation procedures for regulating chlorine statewide. This provision allows the Regional Water Board to reopen this General Board Order to include a revised reporting level for determining compliance with effluent limitations for total residual chlorine if a statewide policy for such is adopted during the term of this General Board Order.

#### 2. Special Studies and Additional Monitoring Requirements – Not Applicable

#### 3. Best Management Practices or Control Strategies

- a. **BMP or Control Strategy Plan.** Because of the expected diversity of low threat discharges covered by this General Board Order, specific technology-based effluent

limitations for the universe of compounds that could be found in wastewater have not been established. As allowed under 40 CFR 122.44(k), BMPs or control strategies will serve in lieu of technology-based effluent limitations, in order to carry out the purposes and intent of the CWA. Each Discharger authorized under the General Board Order is required to develop and implement a BMP or Control Strategy Plan to control or abate the discharge of pollutants. The Discharger shall develop a BMP Plan if the Discharger does not already have one in place. The BMP Plan shall be consistent with the general guidance contained in the USEPA *Guidance Manual for Developing Best Management Practices* (BMPs) (EPA 833-B-93-004). The Discharger may consult other handbooks for guidance, such as the California Stormwater Best Management Practice Handbooks developed by the California Stormwater Quality Association, available at <http://www.cabmphandbooks.org/>, to address the site-specific discharge situation. Dischargers exceeding the applicable screening levels for total residual chlorine, pathogens, and/or TSS contained in Attachment B are required to submit the BMP or Control Strategy Plan with the NOI.

**4. Construction, Operation, and Maintenance Specifications – Not Applicable**

**5. Special Provisions for Municipal Facilities (POTWs Only) – Not Applicable**

**6. Other Special Provisions – Not Applicable**

**7. Required Submittals and Reports**

This section specifies the deliverables and due dates for the annual report.

**VIII. PUBLIC PARTICIPATION**

The Regional Water Board is considering the issuance of WDRs that will serve as a NPDES permit for the discharge of low threat wastewaters to surface water. As a step in the WDR adoption process, the Regional Water Board staff has developed tentative WDRs. The Regional Water Board encourages public participation in the WDR adoption process.

**A. Notification of Interested Parties**

The Regional Water Board has notified potential Dischargers and interested agencies and persons of its intent to prescribe WDRs for low threat discharges to surface waters and has provided interested parties an opportunity to submit written comments and recommendations. Notification was provided to interested parties through the *Imperial Valley Press*, *Palo Verde Valley Times*, *Press Enterprise* and *Desert Sun* newspapers.

**B. Written Comments**

The staff determinations are tentative. Interested persons are invited to submit written comments concerning these tentative WDRs. Comments must be submitted either in person or by mail to the Executive Office at the Regional Water Board at the address above on the cover page of this General Board Order.

To be fully responded to by staff and considered by the Regional Water Board, written comments must be received at the Regional Water Board office by 5:00 p.m. on October 15, 2009

### **C. Public Hearing**

The Regional Water Board will hold a public hearing on the tentative WDRs during its regular Board meeting on the following date and time and at the following location:

Date: November 19, 2009  
Time: 10:00 AM  
Location: City of Palm Desert  
City Council Chambers  
73-510 Fred Waring Drive  
Palm Desert, CA 92260

Interested persons are invited to attend. At the public hearing, the Regional Water Board will hear testimony, if any, pertinent to low threat discharges, WDRs, and NPDES permit. Oral testimony will be heard; however, for accuracy of the record, important testimony should be submitted in writing.

Please be aware that dates and venues may change. The Regional Water Board's Web address is <http://www.waterboards.ca.gov/coloradoriver>, where you may access the Regional Water Board's current agenda and determine if changes in hearing dates and locations have been made.

### **D. Waste Discharge Requirements Petitions**

Any person aggrieved by this action of the Regional Water Board may petition the State Water Board to review the action in accordance with Water Code section 13320 and the California Code of Regulations, title 23, sections 2050 and following. The State Water Board must receive the petition by 5:00 p.m., 30 days after the date of this General Board Order, except that if the thirtieth day following the date of this General Board Order falls on a Saturday, Sunday, or state holiday, the petition must be received by the State Water Board by 5:00 p.m. on the next business day. Copies of the law and regulations applicable to filing petitions may be found on the Internet at:

[http://www.waterboards.ca.gov/public\\_notices/petitions/water\\_quality](http://www.waterboards.ca.gov/public_notices/petitions/water_quality)

or will be provided upon request.

State Water Resources Control Board  
Office of Chief Counsel  
P.O. Box 100, 1001 I Street  
Sacramento, CA 95812-0100

### **E. Information and Copying**

Related documents, tentative effluent limitations and special provisions, comments received, and other information are on file and may be inspected at the Regional Water Board office at any time between 8:30 a.m. and 4:45 p.m., Monday through Friday. Copying of documents may be arranged through the Regional Water Board by calling (760) 346-7491.

### **F. Register of Interested Persons**

Any person interested in being placed on the mailing list for information regarding this general WDRs and NPDES permit should contact the Regional Water Board, reference the general WDRs and NPDES permit, and provide a name, address, and phone number.

### **G. Additional Information**

Requests for additional information or questions regarding this General Board Order should be directed to John Carmona at (760) 340-4521.

## ATTACHMENT G – LIST OF PRIORITY POLLUTANTS

**Table G-1 List of Priority Pollutants**

| CTR Number | Parameter                  | CAS Number | Suggested Analytical Methods |
|------------|----------------------------|------------|------------------------------|
| 1          | Antimony                   | 7440360    | EPA 6020/200.8               |
| 2          | Arsenic                    | 7440382    | EPA 1632                     |
| 3          | Beryllium                  | 7440417    | EPA 6020/200.8               |
| 4          | Cadmium                    | 7440439    | EPA 1638/200.8               |
| 5a         | Chromium (III)             | 16065831   | EPA 6020/200.8               |
| 5a         | Chromium (VI)              | 18540299   | EPA 7199/1636                |
| 6          | Copper                     | 7440508    | EPA 6020/200.8               |
| 7          | Lead                       | 7439921    | EPA 1638                     |

## ATTACHMENT H – STATE WATER BOARD MINIMUM LEVELS

The State Water Board Minimum Levels (MLs) in this appendix are for use in reporting and compliance determination purposes in accordance with section 2.4 of the State Implementation Policy. These MLs were derived from data for priority pollutants provided by State certified analytical laboratories in 1997 and 1998. These MLs shall be used until new values are adopted by the State Water Board and become effective. The following tables (Tables H-1 through H-4) present MLs for four major chemical groupings: volatile substances, semi-volatile substances, inorganics, and pesticides and PCBs. The MLs in this appendix are in parts per billion (µg/L).

**Table H-1. Volatile Substances**

| <b>Table 2a - VOLATILE SUBSTANCES*</b> | <b>GC</b> | <b>GCMS</b> |
|--|-----------|-------------|
| 1,1 Dichloroethane                     | 0.5       | 1           |
| 1,1 Dichloroethylene                   | 0.5       | 2           |
| 1,1,1 Trichloroethane                  | 0.5       | 2           |
| 1,1,2 Trichloroethane                  | 0.5       | 2           |
| 1,1,2,2 Tetrachloroethane              | 0.5       | 1           |
| 1,2 Dichlorobenzene (volatile)         | 0.5       | 2           |
| 1,2 Dichloroethane                     | 0.5       | 2           |
| 1,2 Dichloropropane                    | 0.5       | 1           |
| 1,3 Dichlorobenzene (volatile)         | 0.5       | 2           |
| 1,3 Dichloropropene (volatile)         | 0.5       | 2           |
| 1,4 Dichlorobenzene (volatile)         | 0.5       | 2           |
| Acrolein                               | 2.0       | 5           |
| Acrylonitrile                          | 2.0       | 2           |
| Benzene                                | 0.5       | 2           |
| Bromoform                              | 0.5       | 2           |
| Methyl Bromide                         | 1.0       | 2           |
| Carbon Tetrachloride                   | 0.5       | 2           |
| Chlorobenzene                          | 0.5       | 2           |
| Chlorodibromomethane                   | 0.5       | 2           |
| Chloroethane                           | 0.5       | 2           |
| Chloroform                             | 0.5       | 2           |
| Chloromethane                          | 0.5       | 2           |
| Dichlorobromomethane                   | 0.5       | 2           |
| Dichloromethane                        | 0.5       | 2           |
| Ethylbenzene                           | 0.5       | 2           |
| Tetrachloroethylene                    | 0.5       | 2           |
| Toluene                                | 0.5       | 2           |
| Trans-1,2 Dichloroethylene             | 0.5       | 1           |
| Trichloroethene                        | 0.5       | 2           |
| Vinyl Chloride                         | 0.5       | 2           |

\*The normal method-specific factor for these substances is 1; therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance.

**Table H-2. Semi-Volatile Substances**

| <b>Table 2b - SEMI-VOLATILE SUBSTANCES*</b> | <b>GC</b> | <b>GCMS</b> | <b>LC</b> | <b>COLOR</b> |
|---|-----------|-------------|-----------|--------------|
| Benzo (a) Anthracene                        | 10        | 5           |           |              |
| 1,2 Dichlorobenzene (semivolatile)          | 2         | 2           |           |              |
| 1,2 Diphenylhydrazine                       |           | 1           |           |              |
| 1,2,4 Trichlorobenzene                      | 1         | 5           |           |              |

\*With the exception of phenol by colorimetric technique, the normal method-specific factor for these substances is 1,000; therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance multiplied by 1,000.

\*\*Phenol by colorimetric technique has a factor of 1.

\*The normal method-specific factor for these substances is 100; therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance multiplied by 100.

### **Techniques:**

GC - Gas Chromatography

GCMS - Gas Chromatography/Mass Spectrometry

HRGCMS - High Resolution Gas Chromatography/Mass Spectrometry (i.e., EPA 1613, 1624, or 1625)

LC - High Pressure Liquid Chromatography

FAA - Flame Atomic Absorption

GFAA - Graphite Furnace Atomic Absorption

HYDRIDE - Gaseous Hydride Atomic Absorption

CVAA - Cold Vapor Atomic Absorption

ICP - Inductively Coupled Plasma

ICPMS - Inductively Coupled Plasma/Mass Spectrometry

SPGFAA - Stabilized Platform Graphite Furnace Atomic Absorption (i.e., EPA 200.9)

DCP - Direct Current Plasma

COLOR – Colorimetric

## ATTACHMENT I – NOTICE OF TERMINATION

### NOTICE OF TERMINATION OF COVERAGE UNDER THE GENERAL PERMIT FOR DISCHARGES OF LOW THREAT WASTEWATERS TO SURFACE WATER

**ORDER NO. R7-2009-0300**  
**NPDES NO. CAG997001**

Submission of this Notice of Termination (NOT) constitutes notice that the owner / operator of the facility / project identified on this form is no longer authorized to discharge low threat wastewater to surface water by Order No. R7-2009-0300, National Pollutant Discharge Elimination System (NPDES) Permit No. CAG997001.

#### I. WDID Number

Enter your WDID No. in the space provided:

#### II. OWNER / OPERATOR INFORMATION

|                |        |                 |       |
|----------------|--------|-----------------|-------|
| Name           |        | Mailing Address |       |

| Contact Person | Title  |                 | Phone |

#### III. BASIS FOR TERMINATION

**A.** Indicate the reason for termination of the discharge below. Provide additional explanation under item III.B below.

☐ All discharges previously authorized by this General Board Order have ceased. Project has been completed.

☐ All discharges previously authorized by this General Board Order have been redirected to (*check one*):

☐ Effluent water is retained on site.

☐ Effluent water is discharged to a municipal sanitary sewer system.

☐ Effluent water is discharged to evaporation ponds or percolation ponds offsite.

☐ Effluent water is reused/reclaimed.

☐ Other (please describe)

☐ Discharge of effluent is now subject to another NPDES general permit or an individual NPDES permit. (*Indicate NPDES permit number and date coverage began below.*)

NPDES Permit No: \_\_\_\_\_ Date Coverage Began: \_\_\_\_\_

☐ There is a new owner / operator of the identified facility. (*Complete additional items below.*)

Date of Owner / Operator Transfer: \_\_\_\_\_

Has the new owner / operator been notified of NPDES general permit requirements?

☐ Yes

☐ No

## **D.8 Region 8. Santa Ana Regional Water Quality Control Board**

Order No. R8-2009-0003. NPDES No. CAG998001 General Waste Discharge Requirements for Discharges to Surface Waters that Pose an Insignificant (de minimus) Threat to Water Quality

Order No. R8-2007-0041. NPDES No. CAG918002 General Discharge Permit for Discharges to Surface Waters of Groundwater Resulting From Groundwater Dewatering Operations and/or Groundwater Cleanup Activities at Sites within the San Diego Creek/Newport Bay Watershed Polluted By Petroleum Hydrocarbons, Solvents, Metals and/or Salts

Resolution No. R8-2013-0015. Waiver of Waste Discharge Requirements for Specific Types of Discharges

This Page Intentionally Left Blank.

State of California  
California Regional Water Quality Control Board  
Santa Ana Region

March 27, 2009

**ITEM:** \*9

**SUBJECT:** Issuance of updated general waste discharge requirements for discharges to surface waters that pose an insignificant (de minimus) threat to water quality – Order No. R8-2009-0003, NPDES NO. CAG998001

**DISCUSSION:**

See attached Order No. R8-2009-0003 and Attachments

**RECOMMENDATIONS:**

Adopt Order No. R8-2009-0003, NPDES No. CAG998001 as presented.

**COMMENT SOLICITATION:**

Comments were solicited from the dischargers and the following agencies:

U.S. Environmental Protection Agency, Permits Issuance Section (WTR-5) – Doug Eberhardt  
U.S. Army District, Los Angeles, Corps of Engineers - Regulatory Branch  
U.S. Fish and Wildlife Service, Carlsbad  
State Water Resources Control Board, Office of the Chief Counsel – David Rice  
State Department of Water Resources, Glendale – Charles Keene  
State Department of Fish and Game, Los Alamitos – Latonio  
State Department of Fish and Game, South Coast Region, San Diego – Dolores Duarle  
California Department of Public Health, Santa Ana - Oliver Pacifico  
California Department of Public Health, San Diego - Steve Williams  
California Department of Public Health, San Bernardino - Sean McCarthy  
San Bernardino County Department of Public Health, Division of Environmental Health Services – Daniel Avera  
San Bernardino County Flood Control and Transportation Department - Naresh Varma  
Riverside County Flood Control and Water Conservation District – Jason Uhley  
Riverside County Environmental Health Department - Sandy Bunchek  
Orange County Public Facilities and Resources Department, Flood Control – Chris Crompton/Andy Ngo  
Orange County Health Care Agency - Larry Honeybourne  
Orange County Resources and Development Management Department – Richard Boon  
Orange County Planning & Development Services Department – Trish McNally  
Orange County Water District - Nira Yamachika  
Orange County Coastkeeper - Garry Brown  
Lawyers for Clean Water C/c San Francisco Baykeeper  
Inland Empire Waterkeeper – Lee Reeder  
Defend the Bay, Newport Beach - Robert J. Caustin  
Current R8-2003-0061 enrollees

**ORDER NO. R8-2009-0003  
NPDES NO. CAG998001**

**GENERAL WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES TO SURFACE  
WATERS THAT POSE AN INSIGNIFICANT (DE MINIMUS) THREAT TO WATER QUALITY**

A Discharger, as described in the following table, who has complied with the requirements for coverage under this Order, is authorized to discharge under this Order, once permit coverage is effective, as described in this Order.

|                    |  |
|--------------------|--|
| <b>Dischargers</b> | Individuals/agencies/other parties who discharge wastewater that pose an insignificant (de minimus) threat to water quality of surface waters. |
|--------------------|--|

|  |                       |
|--|-----------------------|
| This Order was adopted by the Regional Water Quality Control Board on:   | <b>March 27, 2009</b> |
| This Order shall become effective on:  | <b>March 27, 2009</b> |
| This Order shall expire on:  | <b>March 1, 2014</b>  |
| The U.S. Environmental Protection Agency (USEPA) and the Regional Water Quality Control Board have classified these discharges as <b>minor</b> discharges. |                       |

IT IS HEREBY ORDERED, that this Order supersedes Order No. R8-2003-0061 except for enforcement purposes, and, in order to meet the provisions contained in division 7 of the California Water Code (commencing with Section 13000) and regulations adopted thereunder, and the provisions of the federal Clean Water Act (CWA) and regulations and guidelines adopted thereunder, the Discharger shall comply with the requirements in this Order.

I, Gerard J. Thibeault, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on March 27, 2009.

**Gerard J. Thibeault, Executive Officer**

SANTA ANA REGIONAL WATER QUALITY CONTROL BOARD

## I. DISCHARGER<sup>1</sup> INFORMATION

### A. Background

Order No. R8-2003-0061, NPDES No. CAG998001 is a general NPDES permit adopted by the California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Water Board), on August 22, 2003 for discharges to surface waters of various types of wastes that pose an insignificant threat to water quality.

On March 4, 2005, Order No. R8-2003-0061 was amended by Order No. R8-2005-0041, allowing the discharge of de minimus discharges within the San Diego Creek/Newport Bay Watershed provided it can be demonstrated that there are no pollutants of concern (selenium and nitrates) in the discharge.

On January 18, 2006, Order No. R8-2003-0061 was again amended by Order No. R8-2006-0004 to include the proposed discharge of decanted backwash filter wastewater and/or sludge dewatering filtrate water from water treatment facilities as one of the types of discharges that may be considered for coverage under this general Order.

To date, 166 Dischargers have been authorized under Order No. R8-2003-0061; of these, 113 are still active. It is anticipated that these existing Dischargers will be submitting renewal applications for continued discharges. The demand for permit issuance will far exceed the available staff resources to develop and bring individual tentative waste discharge requirements to the Board for adoption. These circumstances necessitate the renewal of this general NPDES permit.

### B. Regulatory Approach

1. Order No. R8-2009-0003 (hereinafter, this Order) will update Order No. R8-2003-0061 and will facilitate the processing of permit applications and the implementation of de minimus discharge projects within the Santa Ana Region. However, as discussed in the Fact Sheet (Attachment F), certain types of municipal separate storm sewer system (MS4) permittee discharge activities will no longer be regulated under this Order but will be regulated under the area-wide MS4 permits when these permits are updated appropriately and renewed during the early part of 2009. Similarly, other Waste Discharge Requirement (WDR) holders may no longer be regulated under this Order if their WDRs are appropriately amended. The types of wastewater discharges regulated under this Order include the following discharges:
  - a. Construction dewatering wastes;
  - b. Wastes associated with well installation, development, test pumping and purging;
  - c. Aquifer testing wastes;

---

<sup>1</sup> For the purposes of this Order, references to the "discharger" or "permittee" in applicable federal and State laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

- d. Dewatering wastes from subterranean seepage, except for discharges from utility vaults;
  - e. Discharges resulting from hydrostatic testing of vessels, pipelines, tanks, etc.;
  - f. Discharges resulting from the maintenance of potable water supply pipelines, tanks, reservoirs, etc.;
  - g. Discharges resulting from the disinfection of potable water supply pipelines, tanks, reservoirs, etc.;
  - h. Discharges from potable water supply systems resulting from initial system startup, routine startup, sampling of influent flow, system failures, pressure releases, etc.;
  - i. Discharges from fire hydrant testing or flushing;
  - j. Air conditioning condensate;
  - k. Swimming pool discharge;
  - l. Discharges resulting from diverted stream flows;
  - m. Decanted filter backwash wastewater and/or sludge dewatering filtrate water from water treatment facilities; and
  - n. Other similar types of wastes as determined by the Regional Water Board Executive Officer, which pose a de minimus threat to water quality yet must be regulated under waste discharge requirements.
2. This Order regulates proposed groundwater related discharges and/or de minimus discharges within the San Diego Creek/Newport Bay Watershed that do not contain nutrients, selenium, and other pollutants of TMDL concern at levels that pose a threat to water quality.
3. The following discharges are excluded from regulation under this Order:
- a. Wastewater with pollutants of concern other than those for which effluent limitations are specified in this Order.
  - b. Wastewater discharges from hydro-testing of contaminated pipes or contaminated vessels or tanks.
  - c. Wastewater discharges from draining of decorative ponds, golf course lakes and ponded water (irrigation tailwater that may commingle with stormwater), unless full characterization of the wastewater for the presence of pesticides, priority pollutants, insecticide, biocide and/or other chemicals that may have been applied to the wastewater is provided. There must be a demonstration that there are no pollutants present at levels of concern.

## II. GENERAL PERMIT APPLICATION

### A. New Dischargers

At least 45 days before the start of a new discharge, the Discharger shall submit an application and obtain the authorization letter from the Executive Officer to discharge wastewater to surface waters. The application shall include the following information:

1. Notice of Intent to be covered under this Order.
2. For projects involving well development, well purging and groundwater extraction or dewatering, a site characterization study that defines the proximity of the extraction well to known contaminated sites, the presence of contaminated groundwater onsite, contaminants and their properties and a three-dimensional assessment of the extent and concentration of contaminants in the subsurface and includes a description of the geologic and hydrologic factors that control the migration of the contaminants. It shall also include a list of known or suspected leaking underground tanks and other facilities or operations which have or may have impacted the quality of the underlying groundwater within 200 feet of the site property lines. If the project site is adjacent or near a contaminated site, considering the depth of extraction well, the groundwater extraction flow rate and other influencing factors, the Discharger shall evaluate the possibility of extracting the contaminated groundwater from the adjacent site and shall determine the time at which contaminated wastewater will reach the groundwater extraction wells.
3. A report that shall include the following:
  - a. A list of constituents and the discharge concentration of each constituent from each source. Unless specified elsewhere in this Order, all laboratory analyses for analyzing pollutant concentration shall be in accordance with 40 CFR 136. For projects involving well development, well purging and groundwater extraction, a representative groundwater sample shall be analyzed for Cadmium, Chromium VI, Copper, Lead, Mercury, Nickel, Selenium<sup>2</sup>, Silver, Zinc, total dissolved solids, total inorganic nitrogen, hardness, perchlorate, and organic pollutants<sup>3</sup>. Test results shall be reported with the reported minimum levels (ML) and the method detection limit (MDL);
  - b. The estimated average and maximum daily flow rates in million gallons per day (mgd), the expected start date of discharge, the frequency and duration of the discharge;
  - c. The proposed discharge location(s) and latitude and longitude for each discharge point;
  - d. A description of the proposed treatment system (if appropriate);

---

<sup>2</sup> Use modified EPA Method 200.8 using a Dynamic Reaction Cell (DRC) with an ICP-MS and with reporting limit below 1 µg/L

<sup>3</sup> Using EPA method 8260B.

- e. The affected receiving water;
  - f. A map showing the path from the point of initial discharge to the ultimate receiving water. Please try to limit your maps to size of 8.5" X 11".
- 4. Any other information deemed necessary by the Executive Officer.
  - 5. The application for coverage under this Order, including the NOI (see Attachment B of this Order), map(s), report, and fee, must be submitted to the following address:

Permitting Section  
California Regional Water Quality Control Board  
3737 Main Street, Suite 500  
Riverside, CA 92501-3348

## **B. Existing Dischargers**

For existing Dischargers authorized to continue discharging under Order No. R8-2003-0061 after August 1, 2008, discharges will continue to be regulated under the terms and conditions of Order No. R8-2003-0061 until a new discharge authorization is issued, provided that the Discharger submits, no later than April 11, 2009, an updated NOI, a copy of the current Monitoring & Reporting Program previously issued to the Discharger, and proposed treatment modifications (if any). If no application is submitted, the Discharger shall terminate the discharge upon the effective date of this Order.

## **C. Effectivity of Coverage**

Coverage under this Order shall be effective on the date that the Executive Officer issues a discharge authorization letter, which shall include a self monitoring program for the proposed discharge.

## **D. Termination of Coverage**

The Discharger shall inform the Regional Water Board by a letter if coverage under this Order is no longer needed. Upon receipt of said letter, the Regional Water Board Executive Officer or a designee shall issue a letter terminating coverage under this Order.

## **E. Election of Permit Coverage**

Dischargers already covered under the NPDES program, whether by a general or individual permit, may elect to continue coverage under the existing valid permit or may submit a complete application for coverage under this Order. Dischargers who submit a complete application under this Order are not required to submit an individual permit application. The Regional Water Board may request additional information and determine that a Discharger is not eligible for coverage under this Order and would be better regulated under an individual or other general NPDES permit or, for discharges to land, under waste discharge requirements (WDRs). If the Regional Water Board issues an NPDES permit or WDRs, the applicability of this Order to the specified discharge is immediately terminated on the effective date of the NPDES permit or WDRs.

## **III. FINDINGS**

The Regional Water Board finds:

### **A. Background.**

This Order replaces Order No. R8-2003-0061. The NPDES permit number, No. CAG998001, remains the same. Dischargers enrolled under the previous Order No. R8-2003-0061 must obtain coverage under this new Order to continue their authorization to discharge. To obtain authorization for continued and future discharge to waters of the United States, Dischargers must submit a complete application, as described in II.A. and B. above, and obtain coverage in order to be regulated under this Order as provided in 40 Code of Federal Regulations (CFR) Section 122.28 (b)(2).

For the purposes of this Order, references to the “discharger” or “permittee” in applicable federal and State laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

### **B. Industry Description.**

This Order regulates de minimus discharges (as listed in Section I. Discharge Information, above) to surface waters. The discharges are to surface waters, including estuarine and ocean waters, within the Santa Ana Region, including de minimus discharges to Newport Bay and San Diego Creek watershed that do not contain nutrients, selenium, and other pollutants of TMDL concern at levels that pose a threat to water quality or beneficial uses.

- C. Legal Authorities.** This Order is issued pursuant to Section 402 of the federal Clean Water Act (CWA) and implementing regulations adopted by the U.S. Environmental Protection Agency (USEPA) and Chapter 5.5, Division 7 of the California Water Code (CWC) (commencing with Section 13370). It shall serve as an NPDES permit for de minimus point source discharges from facilities to surface waters. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to Article 4, Chapter 4, Division 7 of the California Water Code (commencing with Section 13260).
- D. Background and Rationale for Requirements.** The Regional Water Board developed the requirements in this Order based on information obtained through issuance and enforcement of the prior general permits for groundwater cleanup discharges, through monitoring and reporting programs, and other available information. The Fact Sheet (Attachment F), which contains background information and rationale for Order requirements, is hereby incorporated into this Order and, thus constitutes part of the Findings for this Order. Attachments A through E and G through I are also incorporated into this Order.
- E. California Environmental Quality Act (CEQA).** Under Water Code Section 13389, this action to adopt an NPDES permit is exempt from the provisions of CEQA, Public Resources Code Section 21000 et seq. (*County of Los Angeles v. California State Water Resources Control Board* (2006) 143 Cal.App.4th 985, mod. (Nov. 6, 2006, B184034) 50 Cal.Rptr.3d 619, 632-636.)
- F. Technology-based Effluent Limitations.** Section 301(b) of the CWA and implementing USEPA permit regulations at Section 122.44, title 40 of the Code of Federal Regulations<sup>4</sup>, requires that permits include conditions meeting applicable technology-based requirements at a minimum, and any more stringent effluent limitations necessary to meet applicable water quality standards (WQS). The discharges authorized by this Order must, at a minimum, meet technology-based requirements and/or Best Professional Judgment (BPJ) standard in accordance with Part 125, Section 125.3. A detailed discussion of the technology-based effluent limitations development is included in the Fact Sheet. This Order does not include technology-based Effluent Limitation.
- G. Water Quality-Based Effluent Limitations (WQBELs).** Section 301(b) of the CWA and Section 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable WQS.

---

<sup>4</sup>

All further statutory references are to title 40 of the Code of Federal Regulations unless otherwise indicated.

Section 122.44(d)(1)(i) mandates that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, WQBELs must be established using: (1) USEPA criteria guidance under CWA Section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in Section 122.44(d)(1)(vi).

**H. Water Quality Control Plans.** The Regional Water Board adopted a revised Water Quality Control Plan for the Santa Ana Region (hereinafter Basin Plan) that became effective on January 24, 1995 (Resolution No. 94-1). The Basin Plan designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters in the Santa Ana Region addressed through the Basin Plan. More recently, Resolution No. R8-2004-0001 amended the Basin Plan significantly to incorporate revised boundaries for groundwater subbasins, now termed "management zones", new nitrate-nitrogen and TDS objectives for the new management zones, and new nitrogen and TDS management strategies applicable to both surface and ground waters. This Basin Plan amendment was adopted by the Regional Water Board on January 22, 2004. The State Water Resources Control Board (State Water Board) and Office of Administrative Law (OAL) approved the amendment on September 30, 2004 and December 23, 2004, respectively. EPA approved the surface water standards components of the nitrogen/total dissolved solids (N/TDS) amendment on June 20, 2007.

The existing and potential beneficial uses of surface waters in the Santa Ana Region are designated in Chapter 3 of the Basin Plan and may include:

1. Municipal and Domestic Supply,
2. Agricultural Supply,
3. Industrial Service Supply,
4. Industrial Process Supply,
5. Groundwater Recharge,
6. Hydropower Generation,
7. Water Contact Recreation,
8. Non-contact Water Recreation
9. Warm Freshwater Habitat,
10. Limited Warm Freshwater Habitat,
11. Cold Freshwater Habitat,

12. Preservation of Biological Habitats of Special Significance,
13. Wildlife Habitat,
14. Marine Habitat,
15. Shellfish Harvesting,
16. Estuarine Habitat,
17. Rare, Threatened or Endangered Species, and
18. Spawning, Reproduction, and Development.

Many surface waters within the region recharge underlying groundwater basins. The existing and potential beneficial uses of groundwater within the Santa Ana Region generally include:

1. Municipal and Domestic Supply,
2. Agricultural Supply,
3. Industrial Service Supply, and
4. Industrial Process Supply

Requirements of this Order implement the Basin Plan.

- I. National Toxics Rule (NTR) and California Toxics Rule (CTR).** USEPA adopted the NTR on December 22, 1992, and later amended it on May 4, 1995 and November 9, 1999. About forty criteria in the NTR applied in California. On May 18, 2000, USEPA adopted the CTR. The CTR promulgated new, numeric criteria for certain priority pollutants in California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the State. The CTR was amended on February 13, 2001. The NTR and CTR contain water quality criteria for priority pollutants. This Order does not include priority pollutants limits, because this Order covers only discharges that pose an insignificant (de minimus) threat to water quality.
- J. State Implementation Policy.** On March 2, 2000, the State Water Board adopted the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (State Implementation Policy or SIP). The SIP became effective on April 28, 2000 with respect to the priority pollutant criteria promulgated for California by the USEPA through the NTR and to the priority pollutant objectives established by the Regional Water Board in the Basin Plan. The SIP became effective on May 18, 2000 with respect to the priority pollutant criteria promulgated by the USEPA through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005 that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for toxicity control. Requirements of this Order implement the SIP.

**K. Compliance Schedules and Interim Requirements – Not Applicable**

- L. Alaska Rule.** On March 30, 2000, USEPA revised its regulation that specifies when new and revised State and Tribal WQS become effective for CWA purposes. (40 C.F.R. Section 131.21; 65 Fed. Reg. 24641 (April 27, 2000).) Under the revised regulation (also known as the Alaska rule), new and revised standards submitted to USEPA after May 30, 2000, must be approved by USEPA before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA by May 30, 2000, may be used for CWA purposes, whether or not approved by USEPA.
- M. Stringency of Requirements for Individual Pollutants.** This Order contains water quality based effluent limitations for individual pollutants. This Order contains effluent limitations more stringent than the minimum, federal technology-based requirements that are necessary to meet WQS.
- N. Antidegradation Policy.** Section 131.12 requires that the state water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The Regional Water Board's Basin Plan implements, and incorporates by reference, both the state and federal antidegradation policies. As discussed in detail in the Fact Sheet, the permitted discharge is consistent with the antidegradation provision of section 131.12 and State Water Board Resolution No. 68-16.
- O. Anti-Backsliding Requirements.** Sections 402(o)(2) and 303(d)(4) of the CWA and federal regulations at title 40, Code of Federal Regulations Section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. As discussed in the Fact Sheet, the limitations in this Order are at least as stringent as the effluent limitations in the prior Order.
- P. Monitoring and Reporting.** Section 122.48 of 40 CFR requires that all NPDES permits specify requirements for recording and reporting monitoring results. Water Code Sections 13267 and 13383 authorize the Regional Water Board to require technical and monitoring reports. The Monitoring and Reporting Program establishes monitoring and reporting requirements to implement federal and State requirements. This Monitoring and Reporting Program is provided in Attachment E.

Existing Dischargers enrolled under Order No. R8-2003-0061 who wish to continue discharging under this Order shall, as appropriate, be issued a monitoring and reporting program similar to the previous monitoring and reporting program issued under Order No. R8-2003-0061. For discharges not previously reported the monitoring and reporting program may be revised accordingly.

**Q. Standard and Special Provisions.** Standard Provisions, which apply to all NPDES permits in accordance with Section 122.41, and additional conditions applicable to specified categories of permits in accordance with Section 122.42, are provided in Attachment D. Dischargers must comply with all standard provisions and with those additional conditions that are applicable under Section 122.42. The Regional Water Board has also included in this Order special provisions applicable to any Dischargers. A rationale for the special provisions contained in this Order is provided in the attached Fact Sheet.

**R. Notification of Interested Parties.** The Regional Water Board has notified the Dischargers currently regulated under Order No. R8-2003-0061 and interested agencies and persons of its intent to prescribe WDRs for the discharge and has provided them with an opportunity to submit their written comments and recommendations. Details of this notification are provided in the Fact Sheet (Attachment F) of this Order.

**S. Consideration of Public Comment.** The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharge. Details of the Public Hearing are provided in the Fact Sheet (Attachment F) of this Order.

#### **IV. DISCHARGE PROHIBITIONS**

- A. The discharge of oil, trash, industrial waste sludge, or other solids directly to the surface waters in this region or in any manner that will ultimately affect surface waters in this region is prohibited.
- B. The discharge of any substances in concentrations toxic to aquatic life, animal life, or plant life is prohibited.
- C. The discharge of wastes to property not owned or controlled by the Discharger is prohibited.
- D. Odors, vectors, and other nuisances of waste origin are prohibited beyond the limits of each Discharger's facility.
- E. The addition of chemicals to the extracted groundwater, exclusive of chlorine to control biofouling in treatment systems, is prohibited except when approved in writing by the Executive Officer.
- F. There shall be no direct discharges of waste to Areas of Special Biological Significance such as Newport Beach Marine Life Refuge and Irvine Coast Marine Life Refuge.

## V. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

The limitations apply at the point of the discharge. If the receiving surface water body is dry and the wastewater percolates to the same groundwater management zone from which the groundwater was extracted and/or dewatered, these limitations do not apply.

### A. Effluent Limitations and Discharge Specifications

#### 1. Final Effluent Limitations

- a. The Discharger shall maintain compliance with the following effluent limitations at approved compliance point monitoring locations:

**Table 1. Effluent Limitations Applicable to All Receiving Waters**

| Constituent                          | Maximum Daily Concentration Limit in milligrams per liter (mg/L) |
|--------------------------------------|--|
| Total Dissolved Solids (TDS)         | See Section A.4. and Section A.5., below                         |
| Total Inorganic Nitrogen (TIN)       | See Section A.4. and Section A.5., below                         |
| Total Petroleum Hydrocarbons         | 0.1 mg/L   |
| Total Residual Chlorine <sup>5</sup> | 0.1 mg/L   |
| Suspended Solids                     | 75 mg/L  |
| Sulfides                             | 0.4 mg/L   |
| Oil and Grease                       | 15 mg/L  |

2. The pH of the discharge shall be within 6.5 and 8.5 pH units (see also Receiving Water Limitations B.2.g.).
3. There shall be no visible oil and grease in the discharge.
4. The discharge of decanted filter backwash wastewater and/or sludge dewatering filtrate water from water treatment facilities shall not contain a total suspended solids maximum daily concentration in excess of 30 mg/L.
5. For discharges to surface waters where groundwater will not be affected by the discharge, the TDS and/or TIN of the effluent shall not exceed the water quality objectives for the receiving surface water where the effluent is discharged, as specified in Table 4-1 of the Basin Plan for the Santa Ana Region.

---

<sup>5</sup> If chlorine is used for treatment or disinfection of wastes.

6. For discharges to surface waters where the groundwater will be affected by the discharge, the TDS and/or TIN concentrations of the effluent shall not exceed the water quality objectives for the surface water where the effluent is discharged nor the affected groundwater management zone, as specified in Table 4-1 of the Basin Plan for the Santa Ana Region. The more restrictive water quality objectives shall govern. However, treated effluent exceeding the groundwater management zone water quality objectives may be returned to the same management zone from which it was extracted without reduction of the TDS or TIN concentrations so long as the concentrations of those constituents are no greater than when the groundwater was first extracted. Incidental increases in the TDS and TIN concentrations (such as may occur during air stripping) of treated effluent will not be considered increases for the purposes of determining compliance with this discharge specification.

**B. Land Discharge Specifications – Not Applicable**

**C. Reclamation Specifications – Not Applicable**

**VI. RECEIVING WATER LIMITATIONS**

**A. Surface Water Limitations**

1. The discharge of wastes shall not cause a violation of any applicable WQS for receiving waters adopted by the Regional Water Board or the State Water Board, as required by the Federal CWA and any regulations adopted thereunder.
2. The discharge shall not cause any of the following:
  - a. Coloration of the receiving waters that causes a nuisance or adversely affects beneficial uses. The natural color of fish, shellfish or other inland, bay and estuarine water resources used for human consumption shall not be impaired.
  - b. Deposition of oil, grease, wax or other materials in the receiving waters in concentrations that result in a visible film or in coating objects in the water, or which cause a nuisance or adversely affect beneficial uses.
  - c. An increase in the amounts of suspended or settleable solids in the receiving waters that will cause a nuisance or adversely affect beneficial uses as a result of controllable water quality factors.
  - d. Taste or odor producing substances in the receiving waters at concentrations that cause a nuisance or adversely affect beneficial uses.
  - e. The presence of radioactive materials in the receiving waters in concentrations that is deleterious to human, plant or animal life.
  - f. The depletion of the dissolved oxygen concentration below 5.0 mg/L.

- g. The temperature of the receiving waters to be raised above 90°F (32°C) during the period of June through October, or above 78°F (26°C) during the rest of the year.
  - h. Change the ambient pH levels more than 0.5 pH units.
  - i. The concentration of pollutants in the water column, sediments, or biota to adversely affect the beneficial uses of the receiving water. The discharge shall not result in the degradation of inland surface water communities and populations, including vertebrate, invertebrate, and plant species.
3. Pollutants not specifically mentioned and limited in this Order shall not be discharged at levels that will bioaccumulate in aquatic resources to levels which are harmful to human health or animal life.

#### **B. Groundwater Limitations**

- 1. The discharge shall not cause the underlying groundwater to be degraded, to exceed water quality objectives, unreasonably affect beneficial uses, or cause a condition of pollution or nuisance.
- 2. The discharge, in combination with other sources, shall not cause underlying groundwater to contain waste constituents in concentrations greater than background water quality.

### **VII. PROVISIONS**

#### **A. Standard Provisions**

- 1. The Discharger shall comply with all Standard Provisions included in Attachment D of this Order.
- 2. Neither the treatment nor the discharge of waste shall create, or threaten to create, a nuisance or pollution as defined by Section 13050 of the California Water Code.
- 3. This Order expires on March 1, 2014. However, coverage under the Order shall continue in force and effect until a new Order is issued. Only those Dischargers authorized to discharge under the expiring Order are covered by the continued Order. Upon reissuance of a new Order, the Dischargers shall file a new application within 45 days of the effective date of the new order and obtain a new authorization to discharge from the Executive Officer.

4. The Executive Officer shall determine whether the proposed discharge is eligible for coverage under this Order, after which, the Executive Officer may;
  - a. Authorize the proposed discharge by transmitting a "Discharge Authorization Letter" to the discharge proponent (now an "Authorized Discharger") authorizing the initiation of the discharge under the conditions of this Order and any other conditions consistent with this Order which are necessary to protect the beneficial uses of the receiving waters; or,
  - b. Require the discharge proponent to obtain an individual NPDES permit prior to any discharge to surface waters within the Santa Ana Region.
5. The Executive Officer is authorized to issue a single discharge authorization letter to a Discharger proposing unknown future de minimus discharges at multiple locations within the Santa Region, provided that the general nature of the discharges and the general locations are reported and included in the application to discharge wastes under this general permit and that at least five days prior to each discharge, more detailed information regarding each discharge is reported. (see section VIII.B.4.)
6. The Discharger shall comply with all the requirements of this Order and the terms and conditions of the discharge authorization letter. The discharge authorization letter from the Executive Officer shall identify the discharge location(s), specify any conditions necessary to protect the beneficial uses of the receiving waters, and shall specify the Self-Monitoring Program for the proposed discharge in accordance with this Order. The discharge authorization letter may be terminated or revised by the Executive Officer at any time. Any and all discharge authorization letters, which may be issued by the Executive Officer pursuant to this Order, are incorporated by reference into this Order.
7. For projects involving groundwater dewatering, the Discharger shall assure that extraction wells at the project site are properly abandoned/demolished or sealed at the completion of the project, to prevent the occurrence of future groundwater contamination resulting from groundwater extraction wells.
8. The Discharger shall give advance notice to the Regional Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with this Order.
9. The Discharger shall take all reasonable steps to minimize or prevent any discharge that has a reasonable likelihood of adversely affecting human health or the environment.

10. The Discharger shall take all reasonable steps to minimize any adverse impacts to receiving waters resulting from noncompliance with any effluent limitations specified in this Order, including such accelerated or additional monitoring as necessary to determine the nature and impact of the noncomplying discharge. When adverse impacts are identified following exceedance of effluent limitation(s), and/or violation of discharge prohibitions and provisions, Dischargers shall mitigate impacts in accordance with a plan approved by the Executive Officer. The proposed plan shall be submitted within 30 days of the finding of an adverse impact.
11. The Discharger shall, at all times, properly operate and maintain all facilities and systems of treatment (and related appurtenances) and control which are installed or used by the Discharger to achieve compliance with this Order and the conditions of the discharge authorization letter(s) from the Executive Officer. Proper operation and maintenance shall include the following:
  - a. Effective performance, adequate funding, adequate operator staffing and training and adequate laboratory and process controls and appropriate quality assurance procedures.
  - b. Regular maintenance and inspection of all systems.
  - c. Maintenance of records of the inspection results that shall be made available to the Regional Water Board whenever required and demanded.
12. The Discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate these requirements.
13. This Order does not convey any property rights of any sort, or any exclusive privilege.
14. This Order is not transferable to any person except after notice to and approval by the Regional Water Board.
15. The requirements prescribed herein do not authorize the commission of any act causing injury to the property of another, nor protect the Discharger from liabilities arising under federal, State, or local laws, nor guarantee the Discharger a capacity right in the receiving waters.
16. The provisions of this Order are severable, and if any provision of this Order, or the application of any provisions of this Order to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this Order shall not be affected thereby.

17. Any violation of this Order constitutes a violation of the CWA, its regulations, and the California Water Code, and is grounds for enforcement action and/or termination of the authorization to discharge.
18. Failure to comply with provisions or requirements of this Order, or violation of other applicable laws or regulations governing discharges from this facility, may subject the Discharger to administrative or civil liabilities, criminal penalties, and/or other enforcement remedies to ensure compliance. Additionally, certain violations may subject the Discharger to civil or criminal enforcement from appropriate local, State, or federal law enforcement entities.
19. In the event the Discharger does not comply or will be unable to comply for any reason, with any prohibition, discharge limitation (e.g., maximum daily effluent limitation), or receiving water limitation of this Order, the Discharger shall notify the Regional Water Board by telephone (951) 782-4130 within 24 hours of having knowledge of such noncompliance that may endanger public health or the environment, and shall confirm this notification in writing within five days, unless the Regional Water Board waives confirmation. The written notification shall state the nature, time, duration, and cause of noncompliance, and shall describe the measures being taken to remedy the current noncompliance and, prevent recurrence including, where applicable, a schedule of implementation. Other noncompliance requires written notification as above at the time of the normal monitoring report.

## **B. Monitoring and Reporting Program (MRP) Requirements**

The Discharger shall comply with the monitoring and reporting program issued by the Executive Officer with the discharge authorization letter. Revision of this monitoring and reporting program by the Executive Officer may be necessary to confirm that the Discharger is in compliance with the requirements and provisions contained in this Order. Revisions may be made by the Executive Officer at any time during the term of this Order, and may include a reduction or an increase in the number of constituents to be monitored, the frequency of monitoring or the number and size of samples collected. Reduction in the number of constituents being monitored and/or frequency of monitoring shall be considered only if the following conditions are satisfied:

1. Only Dischargers without any criminal convictions under any (federal, State, or local) environmental statute and who have been assessed no civil or administrative liability for violations of any NPDES permit are eligible.
2. Only Dischargers covered under the previous Order No. R8-2003-0061 or under an existing individual permit for the last consecutive two years who have had no effluent violations of monitored constituents during the last two years are eligible.
3. Constituents with effluent limitations shall be monitored at least once per year.
4. Reductions in monitoring frequency can be considered by the Executive Officer under the following conditions:

- a. For a specific constituent, reduction of weekly monitoring to bi-monthly (every two weeks) monitoring can be considered for approval by the Executive Officer when the effluent monitoring data for the last 3 months shows compliance with effluent limitations.
- b. For a specific constituent, reduction of bi-monthly (every two weeks) monitoring to monthly monitoring can be considered for approval by the Executive Officer when the effluent monitoring data for the last 6 months shows compliance with effluent limitations.
- c. For a specific constituent, reduction of monthly monitoring to quarterly monitoring can be considered for approval by the Executive Officer when the effluent monitoring data for the last 12 months show compliance with effluent limitations.

## **C. Special Provisions**

### **1. Reopener Provisions**

- a. This Order may be reopened for modification, or revocation and reissuance, as a result of the detection of a reportable priority pollutant generated by special conditions included in this Order. These special conditions may be, but are not limited to, fish tissue sampling, whole effluent toxicity, monitoring requirements on internal waste stream(s), and monitoring for surrogate parameters. Additional requirements may be included in this Order as a result of the special condition monitoring data.
- b. If more stringent applicable WQS are promulgated or approved pursuant to Section 303 of the CWA, or amendments thereto, the Regional Water Board will revise and modify this Order in accordance with such standards.
- c. This Order may be reopened to address any changes in State or federal plans, policies or regulations that would affect the requirements for the discharges covered by this Order.
- d. Any permit noncompliance constitutes a violation of the CWA and the California Water Code and is grounds for: (1) an enforcement action; (2) permit or authorization letter termination, revocation and reissuance, or modification; (3) the issuance of an individual permit; or (4) for denial of a renewal application.
- e. This Order may be modified by the Regional Water Board prior to the expiration date to include effluent or receiving water limitations for toxic constituents determined to be present in significant amounts in the discharge through the comprehensive monitoring program included as part of this Order.
- f. This Order may be modified, revoked and reissued, or terminated for cause.

### **2. Special Studies, Technical Reports and Additional Monitoring Requirements – Not Applicable**

**3. Best Management Practices and Pollution Prevention - Not Applicable**

**4. Construction, Operation and Maintenance Specifications – Not Applicable**

**5. Special Provisions for Municipal Facilities (POTWs Only) - Not Applicable**

**6. Other Special Provisions**

- a. If two consecutive monitoring sample results collected pursuant to the accelerated monitoring program specified in Section IV.A.3. and IV.A.5. of Attachment E also show results in excess of effluent limits and/or greater than the pollutants values listed in Attachment I, or equal or exceed the maximum contaminant level (MCL) values listed in the Attachment I, then the Discharger must cease discharging and notify the Regional Water Board to determine a further course of action.
- b. Proposed wastewater (de minimus) discharges as defined in Section I.B.1. (1.e. through 1.n., excluding 1.l.) within the San Diego Creek/Newport Bay watershed that do not contain nutrients, selenium and other TMDL pollutants of concern at levels that pose a threat to water quality or beneficial uses may apply for coverage under this Order.
- c. The Discharger shall file with the Regional Water Board a report of waste discharge at least 45 days before making any material change or proposed change in the character, location, volume, treatment, or disposal methods of the discharge.
- d. In the event of any change in control or ownership of real property or waste discharge facility currently owned or controlled by the Discharger and which facility or real property are subject to this Order , the Discharger shall notify the succeeding owner of the real property or operator of the facility of the existence of this Order by letter, a copy of which signed by the new owner accepting responsibility for complying with this Order shall be forwarded to the Executive Officer at least 30 days in advance of transfer of ownership..
- e. The Discharger shall furnish, within a reasonable time, any information the Executive Officer may request to determine whether cause exists for modifying, revoking and reissuing, or terminating the Dischargers coverage under this Order. The Discharger shall also furnish to the Executive Officer, upon request, copies of records required to be kept by this Order.
- f. As appropriate, the regulation of the following types of discharges by MS4 permittees shall be transferred to the MS4 permits issued to the cities, municipalities and Counties within the Santa Ana Region, when updated MS4 permits with applicable terms and conditions necessary to address the regulation of these discharges are adopted and effective.

- (1) Dewatering wastes from subterranean seepage, except for discharges from utility vaults;
- (2) Discharges resulting from hydrostatic testing of vessels, pipelines, tanks, etc.;
- (3) Discharges resulting from the maintenance of potable water supply pipelines, tanks, reservoirs, etc.;
- (4) Discharges resulting from the disinfection of potable water supply pipelines, tanks, reservoirs, etc.;
- (5) Discharges from potable water supply systems resulting from initial system startup, routine startup, sampling of influent flow, system failures, pressure releases, etc.;
- (6) Discharges from fire hydrant testing or flushing;
- (7) Air conditioning condensate;
- (8) Swimming pool discharge;
- (9) Discharges resulting from diverted stream flows; and
- (10) Construction dewatering wastes.

#### **7. Compliance Schedules - Not Applicable**

### **VIII. COMPLIANCE DETERMINATION**

1. Compliance determinations shall be based on available analyses for the time interval associated with the effluent limitation. Where only one sample analysis is available in a specified time interval (e.g., weekly, monthly, quarterly), that sample shall serve to characterize the discharge for the entire interval.
2. When determining compliance, based on a single sample, with a single effluent limitation which applies to a group of chemicals (e.g., PCBs), concentrations of individual members of the group may be considered to be zero if the analytical response for individual chemicals falls below the MDL for that chemical.
3. Maximum Daily Effluent Limitation or Maximum Daily Concentration Limit. If a daily discharge (or when applicable, the median for multiple sample data of a daily discharge) exceeds the limit for a given parameter, the Discharger will be considered out of compliance for that parameter for that day only within the reporting period. For any day during which no sample is taken, no compliance determination can be made for that day.

## ATTACHMENT A – DEFINITIONS

**Areas of Special Biological Significance (ASBS)** are those areas designated by the State Water Board as ocean areas requiring protection of species or biological communities to the extent that alteration of natural water quality is undesirable. All Areas of Special Biological Significance are also classified as a subset of State Water Quality Protection Areas.

**Arithmetic Mean ( $\mu$ )**, also called the average, is the sum of measured values divided by the number of samples. For ambient water concentrations, the arithmetic mean is calculated as follows:

$$\text{Arithmetic mean} = \mu = \Sigma x / n \quad \text{where: } \Sigma x \text{ is the sum of the measured ambient water concentrations, and } n \text{ is the number of samples.}$$

**Average Monthly Effluent Limitation (AMEL):** the highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

**Average Weekly Effluent Limitation (AWEL):** the highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

**Best Management Practices (BMPs)** are methods, measures, or practices designed and selected to reduce or eliminate the discharge of pollutants to surface waters from point and nonpoint source discharges including storm water. BMPs include structural and non-structural controls, and operation and maintenance procedures, which can be applied before, during, and/or after pollution producing activities.

**Best Professional Judgment (BPJ) –Based Limits** are technology-based NPDES permits derived on a case-by-case basis using all reasonably available and relevant data for non-municipal facilities in the absence of effluent limitations guidelines (ELG).

**Bioaccumulative** pollutants are those substances taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

**Carcinogenic** pollutants are substances that are known to cause cancer in living organisms.

**Coefficient of Variation (CV)** is a measure of the data variability and is calculated as the estimated standard deviation divided by the arithmetic mean of the observed values.

**Cooling water** for purposes of this Order means water used for cooling of equipment which does not come into direct contact with any raw product, intermediate product (other than heat) or finished product.

**Criteria Continuous Concentration (CCC)** equals the highest concentration of a pollutant to which aquatic life can be exposed for an extended period of time (4 days) without deleterious effects.

**Criteria Maximum Concentration (CMC)** equals the highest concentration of a pollutant to which aquatic life can be exposed for a short period of time without deleterious effects.

**Daily Discharge:** Daily Discharge is defined as either: (1) the total mass of the constituent discharged over the calendar day (12:00 am through 11:59 pm) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day or other 24-hour period defined as a day) or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if 1 day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period will be considered as the result for the calendar day in which the 24-hour period ends.

**Decanted Backwash Filter Wastewater:** Water Treatment Plants are facilities that treat groundwater or surface water to produce potable water. The treatment processes include coagulation, sedimentation, and filtration to remove suspended solids and other pollutants from the intake water. Wastewater discharges come mainly from backwashing of filters and dewatering of sludge. Filter backwashing is an integral part of the water treatment plant operation. Filters are typically cleaned by flushing them with water in the reverse direction to normal flow. The water flow must have sufficient force to separate particles from the filter media, so a greater than normal flow is used. The resulting water, called waste or spent filter backwash water, carries particles flushed from the filters, including microbes (such as *Cryptosporidium*), raw water particles, and particles from the coagulation process. Spent filter backwash is allowed to settle in a clarifier or sedimentation tank. The decanted water is discharged either to the storm drain or to surface waters. The settled particulates (sludge) are either dried through sludge drying beds or dewatered using belt press. Dewatered sludge is hauled offsite for proper disposal.

**Detected, but Not Quantified (DNQ)** are those sample results less than the RL, but greater than or equal to the laboratory's MDL.

**Effluent Concentration Allowance (ECA)** is a value derived from the water quality criterion/objective, dilution credit, and ambient background concentration that is used, in conjunction with the coefficient of variation for the effluent monitoring data, to calculate a long-term average (LTA) discharge concentration. The ECA has the same meaning as waste load allocation (WLA) as used in USEPA guidance (Technical Support Document For Water Quality-based Toxics Control, March 1991, second printing, EPA/505/2-90-001).

**Estimated Chemical Concentration** is the estimated chemical concentration that results from the confirmed detection of the substance by the analytical method below the ML value.

**Existing Discharger** means any discharger that is not a new discharger. An existing discharger includes an “increasing discharger” (i.e., an existing facility with treatment systems in place for its current discharge that is or will be expanding, upgrading, or modifying its existing permitted discharge after the effective date of the State Implementation Policy).

**Infeasible** means not capable of being accomplished in a successful manner within a reasonable period of time, taking into account economic, environmental, legal, social, and technological factors.

**Inland Surface Waters** are all surface waters of the State that do not include the ocean, enclosed bays, or estuaries.

**Instantaneous Maximum Effluent Limitation:** the highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

**Instantaneous Minimum Effluent Limitation:** the lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

**Load Allocation (LA)** is the portion of receiving water's total maximum daily load that is allocated to one of its non-point sources of pollution or to natural background sources.

**Maximum Daily Effluent Limitation (MDEL)** means the highest allowable daily discharge of a pollutant, over a calendar day (or 24-hour period). For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

**Maximum Daily Flow** is the maximum flow sample of all samples collected in a calendar day.

**MEC:** Maximum Effluent Concentration.

**Median** is the middle measurement in a set of data. The median of a set of data is found by first arranging the measurements in order of magnitude (either increasing or decreasing order). If the number of measurements ( $n$ ) is odd, then the median =  $X_{(n+1)/2}$ . If  $n$  is even, then the median =  $(X_{n/2} + X_{(n/2)+1})/2$  (i.e., the midpoint between the  $n/2$  and  $n/2+1$ ).

**Method Detection Limit (MDL)** is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in title 40 of the Code of Federal Regulations, Part 136, Attachment B, revised as of July 3, 1999.

**Minimum Level (ML)** is the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

**Mixing Zone** is a limited volume of receiving water that is allocated for mixing with a wastewater discharge where water quality criteria can be exceeded without causing adverse effects to the overall water body.

**Non-contact cooling water** is water used for cooling that does not come into direct contact with any raw material, product, byproduct, or waste. It includes water generated from any cooling equipment blowdown or produced as a result of any non-contact cooling process through either a single pass (once through) or recirculating system. Most non-contact cooling water systems are also open recirculating cooling systems (see definition below).

**Not Detected (ND)** are those sample results less than the laboratory's MDL.

**Objectionable Bottom Deposits** are an accumulation of materials or substances on or near the bottom of a water body, which creates conditions that adversely impact aquatic life, human health, beneficial uses, or aesthetics. These conditions include, but are not limited to, the accumulation of pollutants in the sediments and other conditions that result in harm to benthic organisms, production of food chain organisms, or fish egg development. The presence of such deposits shall be determined by RWQCB(s) on a case-by-case basis.

**Open Recirculating Cooling Water Systems** use the same water repeatedly to cool process equipment. Heat absorbed from the process must be dissipated to allow reuse of the water. Cooling towers, spray ponds, and evaporative condensers are used for this purpose.

**Persistent pollutants** are substances for which degradation or decomposition in the environment is nonexistent or very slow.

**Pollutant Minimization Program (PMP)** means waste minimization and pollution prevention actions that include, but are not limited to, product substitution, waste stream recycling, alternative waste management methods, and education of the public and businesses. The goal of the PMP shall be to reduce all potential sources of a priority pollutant(s) through pollutant minimization (control) strategies, including pollution prevention measures as appropriate, to maintain the effluent concentration at or below the water quality-based effluent limitation. Pollution prevention measures may be particularly appropriate for persistent bioaccumulative priority pollutants where there is evidence that beneficial uses are being impacted. The Regional Water Board may consider cost effectiveness when establishing the requirements of a PMP. The completion and implementation of a Pollution Prevention Plan, if required pursuant to Water Code section 13263.3(d), shall be considered to fulfill the PMP requirements.

**Pollution Prevention** means any action that causes a net reduction in the use or generation of a hazardous substance or other pollutant that is discharged into water and includes, but is not limited to, input change, operational improvement, production process change, and product reformulation (as defined in Water Code section 13263.3). Pollution prevention does not include actions that merely shift a pollutant in wastewater from one environmental medium to another environmental medium, unless clear environmental benefits of such an approach are identified to the satisfaction of the State or Regional Water Board.

**Reporting Level (RL)** is the ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this Order. The MLs included in this Order correspond to approved analytical methods for reporting a sample result that are selected by the Regional Water Board either from Appendix 4 of the SIP<sup>1</sup> in accordance with section 2.4.2 of the SIP or established in accordance with section 2.4.3 of the SIP. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the RL.

**Sludge Dewatering Filtrate Water:** Some water treatment facilities do not dewater the sludge but rather discharge the sludge directly to the sanitary sewer line. Those water treatment facilities that do dewater the sludge may employ a sludge thickener and/or a belt filter press. The resulting filtrate water from the sludge dewatering operation is the wastewater being discharged.

**Source of Drinking Water** is any water designated as municipal or domestic supply (MUN) in a Regional Water Board Basin Plan.

**Standard Deviation ( $\sigma$ )** is a measure of variability that is calculated as follows:

$$\sigma = \left( \frac{\sum[(x - \mu)^2]}{(n - 1)} \right)^{0.5}$$

where:

- x is the observed value;
- $\mu$  is the arithmetic mean of the observed values; and
- n is the number of samples.

**Technology Based Effluent Limitation** is a permit limit for a pollutant that is based on the capability of a treatment method to reduce the pollutant to a certain concentration.

**Water Effect Ratio (WER)** is an appropriate measure of the toxicity of a material obtained in a site water divided by the same measure of the toxicity of the same material obtained simultaneously in a laboratory dilution water.

---

<sup>1</sup> SIP refers to the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California.

**12-Month Running Average Effluent Limitation (12-MRAEL):** the highest allowable average of monthly discharges over last twelve months, calculated as the sum of all monthly discharges measured during last twelve months divided by the number of monthly discharges measured during that time period.

California Regional Water Quality Control Board  
Santa Ana Region

**NOTICE OF INTENT**

TO COMPLY WITH THE TERMS AND CONDITIONS OF THE GENERAL PERMIT TO DISCHARGE WASTEWATER  
THAT POSE INSIGNIFICANT (DE MINIMUS) THREAT TO WATER QUALITY  
(Order No. R8-2009-0003, NPDES No. CAG998001)

**I. PERMITTEE** (*Person/Agency Responsible for the Discharge*)

Agency/Company Name: \_\_\_\_\_

Address: \_\_\_\_\_

Street City State ZIP

Contact Person: \_\_\_\_\_; Phone: (\_\_\_\_\_) \_\_\_\_\_; Email: \_\_\_\_\_

**II. FACILITY**

Name: \_\_\_\_\_

Location: \_\_\_\_\_

Street City State ZIP

Contact Person: \_\_\_\_\_; Phone: (\_\_\_\_\_) \_\_\_\_\_; Email: \_\_\_\_\_

a. Projected Flow Rate (*gpd*): \_\_\_\_\_, b. Receiving Water (*identify*): \_\_\_\_\_

**III. BILLING INFORMATION** (*Where annual fee invoices should be sent*)

Agency/Company Name: \_\_\_\_\_

Address: \_\_\_\_\_

Street City State ZIP

Contact Person: \_\_\_\_\_; Phone: (\_\_\_\_\_) \_\_\_\_\_; Email: \_\_\_\_\_

**IV. INDICATE EXISTING PERMIT NUMBER:** (*if applicable*)

a. Individual permit Order No. \_\_\_\_\_ NPDES No. \_\_\_\_\_

b. General Permit Order No. R8-2003-0061- \_\_\_\_\_

c. Others (specify) \_\_\_\_\_

---

Remarks: *If changes to facility ownership and/or treatment processes were made after the issuance of the existing permit, please provide a description of such changes on another sheet and submit it with this Notice of Intent.*

**V. OTHER REQUIRED INFORMATION - FOR NEW DISCHARGERS AND FOR NEW DISCHARGES AND LOCATIONS NOT PREVIOUSLY REPORTED BY EXISTING DISCHARGERS.**

Please provide a COMPLETE characterization of your discharge. A complete characterization includes, but is not limited to:

- a. Please provide a paragraph or more describing the actual project(s), i.e. construction dewatering, well development, well pump test, water line maintenance, etc. (a more complete list appears on page 3 and 4 of Order No. R8-2009-0003). Please elaborate on the purpose of the activity, and how it creates the discharge. If more than one activity is planned, please give a description of each one. Also, please indicate the frequency of the discharges if possible, (i.e. one time only, one week only, daily, weekly, monthly, as needed, etc.)

- b. A list of constituents in the discharge and concentration of each constituent;
- c. The estimated average and maximum daily flow rate (gallons per day); the frequency and duration of the discharge and the date(s) when discharge will start/end;
- d. The proposed discharge location(s) as latitude and longitude for each discharge point;
- e. A description of the proposed treatment system (if appropriate);
- f. The name/location of the initial receiving water (storm drain/creek), and the ultimate receiving water, such as the Pacific Ocean, Reach 3 of the Santa Ana River, etc.;
- g. A map showing the path from the point of initial discharge to the ultimate receiving water. Please try to limit your maps to size of 8.5" X 11".
- h. A list of known or suspected leaking underground tanks and other facilities or operations that have, or may have impacted the quality of the underlying groundwater within 200 feet of the site property lines for projects with expected discharge flow rates of less than 100,000 gallons per day and within 500 feet of the site property lines for projects with expected discharge flow rates of greater than 100,000 gallons per day.
- i. Any other information deemed necessary by the Executive Officer.

## VI. OTHER

Attach additional sheets to explain any responses which need clarification. List attachments with titles and dates below:

---

---

---

You will be notified by a representative of the RWQCB within 30 days of receipt of your application. The notice will state if your application is complete or if there is additional information you must submit to complete your application, pursuant to Division 7, Section 13260 of the California Water Code.

## VII. FEE

The current fee for coverage under this general permit is \$1,943.00. Checks should be made payable to the State Water Resources Control Board or SWRCB. A fee must accompany this application for all new discharges.

## VIII. CERTIFICATION:

*I certify under penalty of law that I am an authorized representative of the permittee and that I have personally examined and am familiar with the information submitted in this application and all attachments and that, based on my inquiry of those persons immediately responsible for obtaining the information contained in the application, I believe the information is true, accurate and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment. In addition, I certify that the permittee will comply with the terms and conditions stipulated in Order No. R8-2009-0003, including the monitoring and reporting program issued by the Executive Officer of the Regional Board.*

## **ATTACHMENT D – STANDARD PROVISIONS**

### **I. STANDARD PROVISIONS – PERMIT COMPLIANCE**

#### **A. Duty to Comply**

1. The Discharger must comply with all of the conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code (CWC) and is grounds for enforcement action, for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application [40 *CFR* §122.41(a)].
2. The Discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement [40 *CFR* §122.41(a)(1)].

#### **B. Need to Halt or Reduce Activity Not a Defense**

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order [40 *CFR* §122.41(c)].

#### **C. Duty to Mitigate**

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment [40 *CFR* §122.41(d)].

#### **D. Proper Operation and Maintenance**

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order [40 *CFR* §122.41(e)].

#### **E. Property Rights**

1. This Order does not convey any property rights of any sort or any exclusive privileges [40 *CFR* §122.41(g)].

2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of State or local law or regulations [40 CFR §122.5(c)].

## **F. Inspection and Entry**

The Discharger shall allow the Regional Water Quality Control Board (RWQCB), State Water Resources Control Board (SWRCB), United States Environmental Protection Agency (USEPA), and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to [40 CFR §122.41(i)] [CWC 13383(c)]:

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order [40 CFR §122.41(i)(1)];
2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order [40 CFR §122.41(i)(2)];
3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order [40 CFR §122.41(i)(3)];
4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the CWC, any substances or parameters at any location [40 CFR §122.41(i)(4)].

## **G. Bypass**

1. Definitions
  - a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility [40 CFR §122.41(m)(1)(i)].
  - b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production [40 CFR §122.41(m)(1)(ii)].
2. Bypass not exceeding limitations – The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3, I.G.4, and I.G.5 below [40 CFR §122.41(m)(2)].

3. Prohibition of bypass – Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless [40 CFR §122.41(m)(4)(i)]:
  - a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage [40 CFR §122.41(m)(4)(A)];
  - b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance [40 CFR §122.41(m)(4)(B)]; and
  - c. The Discharger submitted notice to the Regional Water Board as required under Standard Provisions – Permit Compliance I.G.5 below [40 CFR §122.41(m)(4)(C)].
4. The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions – Permit Compliance I.G.3 above [40 CFR §122.41(m)(4)(ii)].
5. Notice
  - a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass [40 CFR §122.41(m)(3)(i)].
  - b. Unanticipated bypass. The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below (24-hour notice) [40 CFR Section 122.41(m)(3)(ii)].

## H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation [40 CFR §122.41(n)(1)].

1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of Standard Provisions – Permit Compliance I.H.2 below are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review [40 CFR Section 122.41(n)(2)].

2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that [40 *CFR* §122.41(n)(3)]:
  - a. An upset occurred and that the Discharger can identify the cause(s) of the upset [40 *CFR* §122.41(n)(3)(i)];
  - b. The permitted facility was, at the time, being properly operated [40 *CFR* §122.41(n)(3)(i)];
  - c. The Discharger submitted notice of the upset as required in Standard Provisions – Reporting V.E.2.b below (24-hour notice) [40 *CFR* Section 122.41(n)(3)(iii)]; and
  - d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above [40 *CFR* §122.41(n)(3)(iv)].
3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof [40 *CFR* §122.41(n)(4)].

## **II. STANDARD PROVISIONS – PERMIT ACTION**

### **A. General**

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition [40 *CFR* §122.41(f)].

### **B. Duty to Reapply**

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit [40 *CFR* §122.41(b)].

### **C. Transfers**

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the CWC [40 *CFR* §122.41(l)(3)] [40 *CFR* §122.61].

### **III. STANDARD PROVISIONS – MONITORING**

- A.** Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity [40 CFR §122.41(j)(1)].
- B.** Monitoring results must be conducted according to test procedures under 40 CFR Part 136 or, in the case of sludge use or disposal, approved under 40 CFR Part 136 unless otherwise specified in 40 CFR Part 503 unless other test procedures have been specified in this Order [40 CFR §122.41(j)(4)] [40 CFR §122.44(i)(1)(iv)].

### **IV. STANDARD PROVISIONS – RECORDS**

- A.** Except for records of monitoring information required by this Order related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by 40 CFR Part 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time [40 CFR §122.41(j)(2)].

**B. Records of monitoring information shall include:**

- 1. The date, exact place, and time of sampling or measurements [40 CFR §122.41(j)(3)(i)];
- 2. The individual(s) who performed the sampling or measurements [40 CFR §122.41(j)(3)(ii)];
- 3. The date(s) analyses were performed [40 CFR §122.41(j)(3)(iii)];
- 4. The individual(s) who performed the analyses [40 CFR §122.41(j)(3)(iv)];
- 5. The analytical techniques or methods used [40 CFR §122.41(j)(3)(v)]; and
- 6. The results of such analyses [40 CFR §122.41(j)(3)(vi)].

**C. Claims of confidentiality for the following information will be denied [40 CFR §122.7(b)]:**

- 1. The name and address of any permit applicant or Discharger [40 CFR §122.7(b)(1)]; and

2. Permit applications and attachments, permits and effluent data [*40 CFR §122.7(b)(2)*].

## **V. STANDARD PROVISIONS – REPORTING**

### **A. Duty to Provide Information**

The Discharger shall furnish to the Regional Water Board, SWRCB, or USEPA within a reasonable time, any information which the Regional Water Board, SWRCB, or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Regional Water Board, SWRCB, or USEPA copies of records required to be kept by this Order [*40 CFR §122.41(h)*] [*CWC 13267*].

### **B. Signatory and Certification Requirements**

1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or USEPA shall be signed and certified in accordance with Standard Provisions – Reporting V.B.2, V.B.3, V.B.4, and V.B.5 below [*40 CFR Section 122.41(k)*].
2. All permit applications shall be signed by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes: (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of USEPA) [*40 CFR Section 122.22(a)(3)*].
3. All reports required by this Order and other information requested by the Regional Water Board, State Water Board, or USEPA shall be signed by a person described in Standard Provisions – Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:
  - a. The authorization is made in writing by a person described in Standard Provisions – Reporting V.B.2 above [*40 CFR Section 122.22(b)(1)*];
  - b. The authorization specified either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) [*40 CFR Section 122.22(b)(2)*]; and
  - c. The written authorization is submitted to the Regional Water Board and State Water Board [*40 CFR Section 122.22(b)(3)*].

4. If an authorization under Standard Provisions – Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions – Reporting V B 3 above must be submitted to the Regional Water Board, State Water Board or USEPA prior to or together with any reports, information, or applications, to be signed by an authorized representative [40 CFR Section 122.22(c)].
5. Any person signing a document under Standard Provisions – Reporting V.B.2 or V.B.3 above shall make the following certification:

“I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations” [40 CFR Section 122.22(d)].

### **C. Monitoring Reports**

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program (Attachment E) in this Order [40 CFR §122.41(l)(4)].
2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or SWRCB for reporting results of monitoring of sludge use or disposal practices [40 CFR §122.41(l)(4)(i)].
3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under 40 CFR Part 136 or, in the case of sludge use or disposal, approved under 40 CFR Part 136 unless otherwise specified in 40 CFR Part 503, or as specified in this Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Regional Water Board [40 CFR §122.41(l)(4)(ii)].
4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order [40 CFR §122.41(l)(4)(iii)].

### **D. Compliance Schedules**

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date [40 CFR §122.41(l)(5)].

## **E. Twenty-Four Hour Reporting**

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance [40 CFR §122.41(l)(6)(i)].
2. The following shall be included as information that must be reported within 24 hours under this paragraph [40 CFR §122.41(l)(6)(ii)]:
  - a. Any unanticipated bypass that exceeds any effluent limitation in this Order [40 CFR §122.41(l)(6)(ii)(A)].
  - b. Any upset that exceeds any effluent limitation in this Order [40 CFR §122.41(l)(6)(ii)(B)].
3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours [40 CFR §122.41(l)(6)(iii)].

## **F. Planned Changes**

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when [40 CFR §122.41(l)(1)]:

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR §122.29(b) [40 CFR §122.41(l)(1)(i)]; or
2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which are subject neither to effluent limitations in this Order nor to notification requirements under 40 CFR Part 122.42(a)(1) (see Additional Provisions—Notification Levels VII.A.1) [40 CFR §122.41(l)(1)(ii)].
3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan [40 CFR §122.41(l)(1)(iii)].

### **G. Anticipated Noncompliance**

The Discharger shall give advance notice to the Regional Water Board or SWRCB of any planned changes in the permitted facility or activity that may result in noncompliance with General Order requirements [40 CFR §122.41(l)(2)].

### **H. Other Noncompliance**

The Discharger shall report all instances of noncompliance not reported under Standard Provisions – Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E above [40 CFR Section 122.41(l)(7)].

### **I. Other Information**

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Water Board, SWRCB, or USEPA, the Discharger shall promptly submit such facts or information [40 CFR §122.41(l)(8)].

## **VI. STANDARD PROVISIONS – ENFORCEMENT**

- A.** The Regional Water Board is authorized to enforce the terms of this permit under several provisions of the CWC, including, but not limited to, sections 13385, 13386, and 13387.

## **VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS**

### **A. Publicly-Owned Treatment Works (POTWs)**

All POTWs shall provide adequate notice to the Regional Water Board of the following [40 CFR Section 122.42(b)]:

1. Any new introduction of pollutants into the POTW from an indirect discharger that would be subject to Sections 301 or 306 of the CWA if it were directly discharging those pollutants [40 CFR Section 122.42(b)(1)]; and
2. Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of the Order [40 CFR Section 122.42(b)(2)].
3. Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW [40 CFR Section 122.42(b)(3)].

## Attachment E – Monitoring and Reporting Program

## **Attachment E – Monitoring and Reporting Program (MRP)**

The Code of Federal Regulations (CFR) at 40 CFR §122.48 requires that all NPDES permits specify monitoring and reporting requirements. CWC Sections 13267 and 13383 also authorize the Regional Water Quality Control Board (Regional Water Board) to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements that implement the federal and California regulations.

### **I. GENERAL MONITORING PROVISIONS**

#### **A. General Monitoring Provision**

1. All sampling and sample preservation shall be in accordance with the current edition of "Standard Methods for the Examination of Water and Wastewater" (American Public Health Association).
2. All laboratory analyses<sup>1, 2</sup> shall be performed in accordance with test procedures under 40 CFR 136 (revised as of April 11, 2007) "Guidelines Establishing Test Procedures for the Analysis of Pollutants," promulgated by the United States Environmental Protection Agency (EPA), unless otherwise specified in this MRP. In addition, the Regional Water Board and/or EPA, at their discretion, may specify test methods that are more sensitive than those specified in 40 CFR 136.
3. Chemical, bacteriological, and bioassay analyses shall be conducted at a laboratory certified for such analyses by the California Department of Public Health in accordance with the provision of Water Code Section 13176, or conducted at a laboratory certified for such analyses by the EPA or at laboratories approved by the Regional Water Board's Executive Officer.
4. In conformance with federal regulations 40 CFR 122.45(c), analyses to determine compliance with the effluent limitations for metals shall be conducted using the total recoverable method. For Chromium (VI), the dissolved method in conformance with 40 CFR 136 may be used to measure compliance with the Chromium (VI) limitation.

---

<sup>1</sup> For Selenium testing use modified EPA Method 200.8 using a Dynamic Reaction Cell (DRC) with an ICP-MS and with reporting limit below 1 ug/L

<sup>2</sup> For testing organic volatile compounds use EPA Method 8260B and report entire suite of detected constituents

5. The Discharger shall require its testing laboratory to calibrate the analytical system down to the minimum level (ML)<sup>3</sup> specified in Attachment “H” for priority pollutants with effluent limitations in this Order, unless an alternative reporting level is approved by the Regional Water Board’s Executive Officer. When there is more than one ML value for a given substance, the Discharger shall use the ML values, and their associated analytical methods, listed in Attachment “H” that are below the calculated effluent limitation. The Discharger may select any one of those cited analytical methods for compliance determination. If no ML value is below the effluent limitation, then the lowest ML value and its associated analytical method, listed in Attachment “H” shall be used. Any internal quality control data associated with the sample must be reported when requested by the Executive Officer. The Regional Water Board will reject the quantified laboratory data if quality control data is unavailable or unacceptable.
6. The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:
  - a. Sample results greater than or equal to the reported ML shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).
  - b. Sample results less than the reported ML, but greater than or equal to the laboratory’s current Method Detection Limit (MDL)<sup>4</sup>, shall be reported as “Detected, but Not Quantified,” or “DNQ.” The estimated chemical concentration of the sample shall also be reported.
  - c. Sample results not detected above the laboratory’s MDL shall be reported as “not detected” or “ND.”
7. The Discharger shall submit to the Regional Water Board reports necessary to determine compliance with effluent limitations in this Order. The Discharger shall report with each sample result:
  - a. The reporting level achieved by the testing laboratory; and
  - b. The laboratory’s current MDL, as determined by the procedure found in 40 CFR 136 (revised as of April 11, 2007).

---

<sup>3</sup> Minimum level is the concentration at which the entire analytical system must give a recognizable signal and acceptable point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

<sup>4</sup> MDL is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analytical concentration is greater than zero, as defined in 40 CFR 136, Appendix B, revised as of April 11, 2007.

8. For receiving water monitoring and for those priority pollutants without effluent limitations, the Discharger shall require its testing laboratory to quantify constituent concentrations to the lowest achievable MDL as determined by the procedure found in 40 CFR 136 (revised as of April 11, 2007)<sup>5</sup>. In situations where the most stringent applicable receiving water objective (freshwater or human health (consumption of organisms only), as specified for that pollutant in 40 CFR 131.38<sup>6</sup> is below the minimum level value specified in Attachment "H" and the Discharger cannot achieve an MDL value for that pollutant below the ML value, the Discharger shall submit justification why a lower MDL value cannot be achieved. Justification shall be submitted together with monthly monitoring reports.
9. The Discharger shall have, and implement an acceptable written quality assurance (QA) plan for laboratory analyses. Duplicate chemical analyses must be conducted on a minimum of ten percent (10%) of the samples, or at least one sample per month, whichever is greater. A similar frequency shall be maintained for analyzing spiked samples. When requested by the Regional Water Board or EPA, the Discharger will participate in the NPDES discharge monitoring report QA performance study.
10. For every item of monitoring data where the requirements are not met, the monitoring report shall include a statement discussing the reasons for noncompliance, the actions undertaken or proposed that will bring the discharge into full compliance with requirements at the earliest time, and an estimate of the date when the Discharger will be in compliance. The Discharger shall notify the Regional Water Board by letter when compliance with the time schedule has been achieved.
11. The Discharger shall assure that records of all monitoring information are maintained and accessible for a period of at least five years (this retention period supercedes the retention period specified in Section IV.A. of Attachment D) from the date of the sample, report, or application. This period of retention shall be extended during the course of any unresolved litigation regarding this discharge or by the request of the Regional Water Board at any time. Records of monitoring information shall include:
  - a. The information listed in Attachment D- IV Standard Provisions – Records, subparagraph B. of this Order;
  - b. The laboratory which performed the analyses;
  - c. The date(s) analyses were performed;
  - d. The individual(s) who performed the analyses;
  - e. The modification(s) to analytical techniques or methods used;
  - f. All sampling and analytical results, including
    - (1) Units of measurement used;
    - (2) Minimum reporting level for the analysis (minimum level);

---

<sup>5</sup> For Selenium testing use modified EPA Method 200.8 using a Dynamic Reaction Cell (DRC) with an ICP-MS and with reporting limit below 1 ug/L

<sup>6</sup> See Federal Register/ Vol. 65, No. 97 / Thursday, May 18, 2000 / Rules and Regulations.

- (3) Results less than the reporting level but above the method detection limit (MDL);
    - (4) Data qualifiers and a description of the qualifiers;
    - (5) Quality control test results (and a written copy of the laboratory quality assurance plan);
    - (6) Dilution factors, if used; and
    - (7) Sample matrix type.
  - g. All monitoring equipment calibration and maintenance records;
  - h. All original strip charts from continuous monitoring devices;
  - i. All data used to complete the application for this Order; and,
  - j. Copies of all reports required by this Order.
  - k. Electronic data and information generated by the Supervisory Control And Data Acquisition (SCADA) System.
12. The flow measurement system shall be calibrated at least once per year or more frequently, to ensure continued accuracy.
13. All monitoring instruments and devices used by the Discharger to fulfill the prescribed monitoring program shall be properly maintained and calibrated as necessary to ensure their continued accuracy. In the event that continuous monitoring equipment is out of service for greater than a 24-hour period, the Discharger shall obtain a representative grab sample each day the equipment is out of service. The Discharger shall correct the cause(s) of failure of the continuous monitoring equipment as soon as practicable. In its monitoring report, the Discharger shall specify the period(s) during which the equipment was out of service and if the problem has not been corrected, shall identify the steps which the Discharger is taking or proposes to take to bring the equipment back into service and the schedule for these actions.
14. Monitoring and reporting shall be in accordance with the following:
- a. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.
  - b. The monitoring and reporting of influent, effluent, and sludge shall be done more frequently as necessary to maintain compliance with this Order and or as specified in this order.
  - c. Whenever the Discharger monitors any pollutant more frequently than is required by this Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the discharge monitoring report specified by the Executive Officer.
  - d. A "grab" sample is defined as any individual sample collected in less than 15 minutes.

- e. A composite sample is defined as a combination of no fewer than eight individual grab samples obtained over the specified sampling period. The volume of each individual grab sample shall be proportional to the discharge flow rate at the time of sampling. The compositing period shall equal the specific sampling period, or 24 hours, if no period is specified.
- f. Daily samples shall be collected on each day of the week.
- g. Monthly samples shall be collected on any representative day of each month.
- h. Quarterly samples: A representative sample shall be taken on any representative day of January, April, July, and October and test results shall be reported in either micrograms/liter (ug/L) or milligrams/liter (mg/L) or nanograms/L (ng/L), as appropriate, by the last day of the month following the month that the sample was taken.
- i. Semi-annual samples shall be collected in January and July.
- j. Annual samples shall be collected in January to December.

## II. MONITORING LOCATIONS

The Discharger shall establish monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order: The sample station shall be located where representative samples of the discharge can be obtained. The volume of daily discharge shall be recorded daily on a permanent log.

## III. INFLUENT MONITORING REQUIREMENTS – NOT APPLICABLE

## IV. EFFLUENT MONITORING REQUIREMENTS

A. The following shall constitute the effluent monitoring program for discharges other than decant filter backwash wastewater and/or sludge dewatering filtrate water. If there is no discharge see Section VIII.B.5., below.

- 1. For intermittent (less than daily) discharge flow of less than 25,000 gallons per day (gpd), effluent monitoring is as follows:

**Table 1. Effluent Monitoring Program for Flow Less than 25,000 GPD**

| Parameter | Unit | Sample Type | Minimum Sampling Frequency | Required Analytical Test Method and Minimum Level, units, respectively |
|-----------|------|-------------|----------------------------|--|
| Flow      | gpd  | measured    | Each discharge event       | See Section I.A.3. above, of this MRP                                  |

**Table 1. Effluent Monitoring Program for Flow Less than 25,000 GPD**

| Parameter                            | Unit       | Sample Type | Minimum Sampling Frequency   | Required Analytical Test Method and Minimum Level, units, respectively |
|--------------------------------------|------------|-------------|--|--|
| Total Petroleum Hydrocarbons         | µg/L       | Grab        | Once monthly or as directed by the Executive Officer thereafter; see also Section IV.A.3.                                    | EPA METHOD 8015 Modified   |
| Oil and Grease                       | mg/L       | Grab        | Once monthly or as directed by the Executive Officer thereafter; see also Section IV.A.3.                                    | See Section I.A.2. above, of this MRP                                  |
| Total Residual Chlorine <sup>7</sup> | mg/L       | Grab        | "  | See Section I.A.2. above, of this MRP                                  |
| Total Suspended Solids <sup>8</sup>  | mg/L       | "           | "  | "  |
| Total Inorganic Nitrogen (TIN)       | mg/L       | "           | "  | "  |
| Sulfate                              | mg/L       | "           | "  | "  |
| pH                                   | Std. Units | "           | "  | "  |
| Total Dissolved Solids               | mg/L       | Grab        | Annually, see also Section IV.A.3.   | "  |
| Hardness                             | mg/L       | "           | "  | "  |
| Pollutants listed in Attachment "I"  | µg/L       | Grab        | Once during the first <sup>9</sup> 30 minutes of the discharge and annually thereafter; see also Section IV.A.4. and IV.A.5. | See Section I.A.2. & I.A.3. above, of this MRP                         |

<sup>7</sup> Unless it is known that chlorine is not in the discharge.

<sup>8</sup> Not applicable if all wastewater will percolate prior to reaching receiving waters.

<sup>9</sup> If the pollutants were monitored at the outset during the application process, the Discharger may submit the analytical results in lieu of the first sampling event.

2. For discharge flow of 25,000 gpd or more, effluent monitoring is as follows:

**Table 2. Effluent Monitoring Program for Flow Over 25,000 GPD**

| Parameter  | Unit       | Sample Type<br>See also<br>IV.A.6.,<br>below | Minimum<br>Sampling<br>Frequency  | Required Analytical Test<br>Method and Minimum<br>Level, units, respectively |
|--|------------|--|---|--|
| Flow   | gpd        | measured                                     | Daily   | See Section I.A.3. above,<br>of this MRP                                     |
| Total Petroleum<br>Hydrocarbons                      | µg/L       | Grab   | During the first 30<br>minutes of the<br>discharge, then<br>monthly see also<br>Section IV.A.3.   | EPA METHOD 8015<br>Modified  |
| Oil and Grease                                       | mg/L       | Grab   | "   | See Section I.A.3. above,<br>of this MRP                                     |
| Total Residual Chlorine <sup>10</sup>                | mg/L       | Grab   | "   | See Section I.A.3. above,<br>of this MRP                                     |
| Total Suspended Solids <sup>11</sup>                 | mg/L       | "  | During the first 30<br>minutes of each<br>discharge event,<br>then monthly, see<br>also Section IV.A.3.                                       | "  |
| Total Inorganic Nitrogen<br>(TIN)                    | mg/L       | "  | "   | "  |
| Sulfate  | mg/L       | "  | "   | "  |
| pH   | Std. Units | "  | "   | "  |
| Temperature  | °F         | "  | "   | "  |
| Total Dissolved Solids                               | mg/L       | Grab   | "   | "  |
| Hardness   | mg/L       | "  | "   | "  |
| Pollutants <sup>12</sup> listed in<br>Attachment "I" | µg/L       | Grab   | Once during the<br>first <sup>13</sup> 30 minutes of<br>the discharge and<br>annually thereafter;<br>see also Section<br>IV.A.4., and IV.A.5. | See Section I.A.2. & I.A.3.<br>above, of this MRP                            |

<sup>10</sup> Unless it is known that chlorine is not in the discharge.

<sup>11</sup> Not applicable if all wastewater will percolate prior to reaching receiving waters.

<sup>12</sup> For testing organic volatile compounds use EPA Method 8260B and report entire suite of detected constituents.

<sup>13</sup> If the pollutants were monitored at the outset during the application process, the Discharger may submit the analytical results in lieu of the first sampling event.

3. Should any of the weekly, bi-monthly, monthly, quarterly or annual monitoring for a specific constituent show effluent concentrations above the effluent limit, the frequency of monitoring for that constituent shall be increased to weekly or as directed by the Executive Officer. To return to the monitoring frequency specified, the Discharger shall request and receive approval from the Regional Water Board's Executive Officer or designee. (See also Provision VII.C.6.a. of the Order regarding conditions that necessitate termination of the discharge.)
  4. Should the annual monitoring for a specific constituent show effluent concentrations above the values specified in Attachment I, the monitoring frequency for that constituent shall be increased to weekly for one quarter or as directed by the Executive Officer. To return to the monitoring frequency specified, the Discharger shall request and receive approval from the Regional Water Board's Executive Officer or designee. (See also Provision VII.C.6.a. of the Order regarding conditions that necessitate termination of the discharge.)
  5. Should two consecutive annual monitoring results for all the constituents specified in Attachment I show values below those listed in Attachment "I", the Discharger may stop monitoring for the pollutants listed in Attachment I.
  6. If the discharge does not last for more than a day, one composite sample shall be taken for the duration of the discharge and shall be analyzed.
- B.** The following shall constitute the effluent monitoring program for discharges from water treatment plants of decant filter backwash wastewater and/or sludge dewatering filtrate water. If there is no discharge see Section VIII.B.5., below.

**Table 3. Effluent Monitoring Program for Decant Filter Backwash Wastewater And/Or Sludge Dewatering Filtrate Water**

| Parameter                             | Unit | Sample Type | Minimum Sampling Frequency                           | Required Analytical Test Method and Minimum Level, units, respectively |
|---------------------------------------|------|-------------|--|--|
| Flow                                  | gpd  | measured    | Daily  | See Section I.A.3. above, of this MRP                                  |
| Total Residual Chlorine <sup>14</sup> | mg/L | Grab        | During the first 30 minutes of each discharge event, | See Section I.A.3. above, of this MRP                                  |
| Total Suspended Solids <sup>15</sup>  | mg/L | Grab        | During the first 30 minutes of each discharge event  | "  |
| Aluminum                              | µg/L | Grab        | "  | See Section I.A. 3. above, of this MRP; RL is 50 µg/L                  |

<sup>14</sup> Unless it is known that chlorine is not in the discharge.

<sup>15</sup> Not applicable if all wastewater will percolate prior to reach receiving waters.

**Table 3. Effluent Monitoring Program for Decant Filter Backwash Wastewater And/Or Sludge Dewatering Filtrate Water**

| Parameter | Unit | Sample Type | Minimum Sampling Frequency                          | Required Analytical Test Method and Minimum Level, units, respectively |
|-----------|------|-------------|---|--|
| Iron      | µg/L | Grab        | "   | See Section I.A.3. above, of this MRP; RL is 100 µg/L                  |
| Manganese | µg/L | Grab        | During the first 30 minutes of each discharge event | See Section I.A.3. above, of this MRP; RL is 20 µg/L                   |

**V. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS – NOT APPLICABLE**

**VI. LAND DISCHARGE MONITORING REQUIREMENTS – NOT APPLICABLE.**

**VII. RECEIVING WATER MONITORING REQUIREMENTS**

Whenever there is a discharge and the Discharger asserts that there are no surface waters at the point where the discharge reaches the stream, the Discharger shall record on a permanent log the following information: (a) the date(s), time(s), and duration(s) of the discharge; (b) a description of the location where the discharge(s) percolated into the ground, (c) the climatic condition in the area during the discharge and (d) the name of the individual(s) who performed the observation. This information shall be submitted with the required quarterly report.

**VIII. REPORTING REQUIREMENTS**

**A. General Monitoring and Reporting Requirements**

1. The Discharger shall comply with all Standard Provisions (Attachment D) related to monitoring, reporting, and recordkeeping.
2. All analytical data shall be reported with method detection limit<sup>16</sup> (MDLs) and with identification of either reporting level or limits of quantitation (LOQs).

<sup>16</sup>

*The standardized test procedure to be used to determine the method detection limit (MDL) is given at Appendix B, 'Definition and Procedure for the Determination of the Method Detection Limit' of 40 CFR 136.*

3. Laboratory data for effluent samples must quantify each constituent down to the down to ML specified in Attachment "H" for priority pollutants. Any internal quality control data associated with the sample must be reported when requested by the Executive Officer. The Regional Water Board will reject the quantified laboratory data if quality control data are unavailable or unacceptable.
4. Discharge monitoring data shall be submitted in a format acceptable to the Regional Water Board. Specific reporting format may include preprinted forms and/or electronic media. The results of all monitoring required by this Order shall be reported to the Regional Water Board, and shall be submitted in such a format as to allow direct comparison with the limitations and requirements of this Order.
5. The Discharger shall submit to the Regional Water Board reports necessary to determine compliance with effluent limitations in this Order and shall follow the chemical nomenclature and sequential order of priority pollutant constituents shown in Attachment "I" – Priority Pollutant Lists. The Discharger shall report with each sample result:
  - a. The reporting level achieved by the testing laboratory; and
  - b. The laboratory's current MDL, as determined by the procedure found in 40 CFR 136 (revised as of April 11, 2007).
6. For non-priority pollutants monitoring, all analytical data shall be reported with identification of method detection limits, as determined by the procedure found in 40 CFR 136 (revised as of April 11, 2007).
7. The State or Regional Water Board may notify the Discharger to discontinue submittal of hard copies of reports. When such notification is given, the Discharger shall stop submitting hard copies of required monitoring reports.

**B. Reporting Requirements:**

1. All monitoring reports, or information submitted to the Regional Water Board shall be signed and certified in accordance with 40 CFR 122.22 and shall be submitted under penalty of perjury.
2. All reports shall be arranged in a tabular format to clearly show compliance or noncompliance with each discharge limitation.
3. Five days prior to any discharge from locations already reported, the Discharger shall notify the Regional Board staff by phone or by a fax letter indicating the date and time of the proposed discharge.

4. Five days prior to any planned discharge<sup>17</sup> from locations not yet reported, the discharger shall notify the Regional Board staff by phone or by a fax letter indicating the following:
  - a. Specific type of the proposed wastewater discharge (see listing on Finding 1 of the Order);
  - b. The estimated average and maximum daily flow rates;
  - c. The frequency and duration of the discharge;
  - d. The affected receiving water(s);
  - e. A description of the proposed treatment system (if appropriate); and
  - f. A description of the path from the point of initial discharge to the ultimate location of discharge (fax a map if possible);
5. If no discharge occurs during the previous monitoring period, a letter to that effect shall be submitted in lieu of a monitoring report specified in Table 4, below.
6. Noncompliance Reporting
  - a. The discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided to the Executive Officer (951-782-4130) and the Office of Emergency Services (1-800-852-7550) orally within 24 hours from the time the discharger becomes aware of the circumstances. A written submission shall also be provided within 5 days of the time the discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause, the period of noncompliance, including exact dates and times and, if the noncompliance has not been corrected, the anticipated time it is expected to continue, and, steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.
  - b. Any violation of a maximum daily discharge limitation for any of the pollutants listed in this Order shall be included as information that must be reported within 24 hours.
  - c. The Regional Water Board may waive the above required written report on a case-by-case basis.
7. Except for data determined to be confidential under Section 308 of the Clean Water Act (CWA), all reports prepared in accordance with the terms of this Order shall be available for public inspection at the offices of the Regional Water Quality Control Board and the Regional Administrator of EPA. As required by the CWA, effluent data shall not be considered confidential.

<sup>17</sup>

*For those unplanned discharges, as much prior notification as possible is required before any discharge is initiated.*

8. Monitoring reports shall be submitted by the 30th day of each month following the monitoring period and shall include:
  - a. The results of all chemical analyses for the previous month, and annual samples whenever applicable,
  - b. The daily flow data,
  - c. A summary of the month's activities including a report detailing compliance or noncompliance with the task for the specific schedule date, and
  - d. For every item of monitoring data where the requirements are not met, the monitoring report shall include a statement discussing the reasons for noncompliance, and of the actions undertaken or proposed which will bring the discharger into full compliance with requirements at the earliest time, and an estimate of the date when the discharger will be in compliance. The discharger shall notify the Regional Water Board by letter when compliance with the time schedule has been achieved.
9. For Dischargers discharging at a volume equal to or greater than 150,000 gallons per day, the Discharger shall submit semi-annual reports that tabulate all measured flows and measured parameters within the most recent six month period. Where discharges associated with these projects last less than 6 months, a report covering the period of discharges shall be submitted. Copies of these monitoring reports shall be submitted to the Regional Water Board and to the Water Quality Director of the Orange County Water District at P.O. Box 8300, Fountain Valley, CA 92728-8300.

### **C. Self Monitoring Reports (SMRs)**

1. At any time during the term of this permit, the State or Regional Water Board may notify the Discharger to electronically submit Self-Monitoring Reports (SMRs) using the State Water Board's California Integrated Water Quality System (CIWQS) Program Web site (<http://www.waterboards.ca.gov/ciwqs/index.html>). Until such notification is given, the Discharger shall submit hard copy SMRs in accordance with the requirements described in subsection B.5 below. The CIWQS Web site will provide additional directions for SMR submittal in the event there will be service interruption for electronic submittal.
2. The Discharger shall report in the SMR the results for all monitoring specified in this MRP under sections III through IX. Additionally, the Discharger shall report in the SMR the results of any special studies, acute and chronic toxicity testing, TRE/TIE, PMP, and Pollution Prevention Plan required by Special Provisions – VI.C. of this Order. The Discharger shall submit monthly, quarterly, and annual SMRs including the results of all required monitoring using USEPA-approved test methods or other test methods specified in this Order. If the Discharger monitors any pollutant more frequently than required by this Order, the results of this monitoring shall be included in the calculations and reporting of the data submitted in the SMR.
3. Monitoring periods and reporting for all required monitoring shall be completed according to the following schedule:

**Table 4. Monitoring Periods and Reporting Schedule**

| <b>Sampling Frequency</b> | <b>Monitoring Period Begins On...</b>  | <b>Monitoring Period</b>  | <b>SMR Due Date</b>   |
|---------------------------|--|---|---|
| Continuous                | Day after permit effective date  | All   | 30 <sup>th</sup> day of the month following the sampling month. |
| Hourly                    | Day after permit effective date  | Hourly  | 30 <sup>th</sup> day of the month following the sampling month. |
| Daily                     | Day after permit effective date  | Midnight through 11:59 PM or any 24-hour period that reasonably represents a calendar day for purposes of sampling.   | 30 <sup>th</sup> day of the month following the sampling month. |
| Weekly                    | Sunday following permit effective date or on permit effective date if on a Sunday  | Sunday through Saturday   | 30 <sup>th</sup> day of the month following the sampling month. |
| Monthly                   | First day of calendar month following permit effective date or on permit effective date if that date is first day of the month | 1 <sup>st</sup> day of calendar month through last day of calendar month  | 30 <sup>th</sup> day of the month following the sampling month. |
| Quarterly                 | Closest of January 1, April 1, July 1, or October 1 following (or on) permit effective date                                    | January 1 through March 31<br>April 1 through June 30<br>July 1 through September 30<br>October 1 through December 31 | April 30<br>July 30<br>October 30<br>January 30                 |
| Semiannually              | Closest of January 1 or July 1 following (or on) permit effective date   | January 1 through June 30<br>July 1 through December 31   | July 30<br>January 30   |
| Annually                  | See Table 1  | See Table 1   | 30 <sup>th</sup> day of the month following the sampling month. |
| Per Discharge Event       | Anytime during the discharge event or as soon as possible after aware of the event   | At a time when sampling can characterize the discharge event  | 30 <sup>th</sup> day of the month following the sampling month. |

## **ATTACHMENT F – FACT SHEET**

This Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of Order No. R8-2009-0003 (hereinafter, this Order).

This Order has been prepared under a standardized format to accommodate a broad range of discharge requirements for Dischargers in California. Some sections or subsections of this Order have therefore been identified as “not applicable” to this group of Dischargers. Sections or subsections of this Order not specifically identified as “not applicable” are fully applicable to the Dischargers authorized by this Order.

### **I. PERMIT INFORMATION**

Order No. R8-2003-0061, NPDES No. CAG998001 is a general NPDES permit adopted by the Regional Water Board on August 22, 2003, for discharges to surface waters of various types of wastes that pose an insignificant threat to water quality. Order No. R8-2003-0061, NPDES No. CAG998001 facilitated the processing of permit applications and the early regulation of projects that created de minimus discharges within the Santa Ana Region. Order No. R8-2003-0061 specifically excluded from coverage under its terms and conditions groundwater-related discharges within the San Diego Creek/Newport Bay watershed. This exclusion was due to concern that selenium, nitrogen and potentially other pollutants present in the discharges could result in adverse water quality and beneficial use impacts in the receiving waters.

On March 4, 2005, Order No. R8-2003-0061 was amended by Order No. R8-2005-0041, allowing de minimus discharges within the San Diego Creek/Newport Bay Watershed provided it could be demonstrated that there were no pollutants of concern (e.g., selenium, nitrates and other pollutants for which a TMDL had been adopted) in the discharge.

On January 18, 2006, Order No. R8-2003-0061 was again amended by Order No. R8-2006-0004 to include discharges of decanted backwash filter wastewater and/or sludge dewatering filtrate water from water treatment facilities.

### **II. NOTIFICATION REQUIREMENTS – GENERAL PERMIT APPLICATION**

This Order requires each existing Discharger regulated under the previous Order No. R8-2003-0061 and who requires ongoing regulatory coverage, to submit an updated Notice of Intent form (NOI) to be covered under this Order by April 11, 2009. De minimus discharges for which an NOI is not submitted by April 11, 2009 are not authorized by this Order and must cease, unless the discharges are authorized pursuant to other waste discharge requirements adopted by the Regional Water Board or State Water Resources Control Board.

This Order requires each new Discharger<sup>1</sup> to submit to the Executive Officer an application for the proposed discharge at least 45 days before the start of a new discharge. The application for the proposed discharge will require, at the minimum, the following information:

- A. Notice of Intent to be covered under this Order - see Attachment B of this Order.
- B. For projects involving well development, well purging, groundwater extraction or dewatering, a site characterization study report defining:
  - 1. The proximity of the well(s) to known contaminated sites;
  - 2. The presence of contaminated groundwater onsite;
  - 3. The contaminants and their properties<sup>2</sup>, and;
  - 4. A three dimensional assessment of the extent and concentration of contaminants in the subsurface. The study report shall include a description of the geologic and hydrologic factors that control the migration of the contaminants. It shall also include a list of known or suspected leaking underground tanks and other facilities or operations which have or may have impacted the quality of the underlying groundwater within 200 feet of the site property lines.
- C. A report that shall include the following:
  - 1. A list of constituents and the discharge concentration of each constituent from each point source. For projects involving well development, well purging and groundwater extraction, a representative groundwater sample shall be analyzed using approved test methods for cadmium, chromium VI, copper, lead, mercury, nickel, selenium<sup>3</sup>, silver, zinc, and including total dissolved solids, total inorganic nitrogen, hardness, perchlorate, and organic pollutants<sup>4</sup>. Test results shall be reported with Minimum levels (ML) and method detection limit (MDL);
  - 2. The estimated average and maximum daily flow rates in million gallons per day (mgd), the expected start and end dates of discharge(s), the frequency and duration of the discharge(s);
  - 3. The proposed discharge location(s) and latitude and longitude for each discharge point;
  - 4. A description of the proposed treatment system (if appropriate);
  - 5. The affected receiving water;
  - 6. A map showing the path from the point of initial discharge to the ultimate receiving water. Please try to limit your maps to size of 8.5" X 11".

---

<sup>1</sup> "New discharger" refers to those proposing to discharge wastewater under Order No. R8-2009-0003 and not currently covered under Order No. R8-2003-0061.

<sup>2</sup> Properties include boiling point, vapor pressure, vapor density, solubility in water, specific gravity, appearance, odor and pH.

<sup>3</sup> Use modified EPA Method 200.8 using a Dynamic Reaction Cell (DRC) with an ICP-MS and with reporting limit below 1 µg/L.

<sup>4</sup> Using EPA method 8260B.

D. Any other information deemed necessary by the Executive Officer.

### III. INDUSTRY DESCRIPTION

Order No. R8-2003-0061 expired on August 1, 2008 but remains in full force and effect until Order No. 2009-0003 is adopted. To date, 166 Dischargers have been authorized under Order No. R8-2003-0061; of these, 113 are still active. Order No. R8-2003-0061 has facilitated the processing of these permit applications. It is anticipated that most of the currently enrolled Dischargers will be submitting renewal applications for authorization of continued de minimus discharges. The demand for permit issuance will exceed the available staff resources to develop and bring individual tentative waste discharge requirements to the Regional Water Board for adoption. These circumstances necessitate the adoption of this Order (also a general NPDES permit) to expedite the processing of current and anticipated permit applications for de minimus discharges.

#### A. Background

Order No. R8-2003-0061 regulated wastewater discharges to surface waters of various types of wastes that pose an insignificant threat to water quality, defined as de minimus discharges, in the Santa Ana Region. The types of discharges regulated under that Order included:

1. Construction dewatering wastes; (except stormwater dewatering at construction sites)<sup>5</sup>
2. Wastes associated with well installation, development, test pumping and purging;
3. Aquifer testing wastes;
4. Dewatering wastes from subterranean seepage, except for discharges from utility vaults;
5. Discharges resulting from hydrostatic testing of vessels, pipelines, tanks, etc.;
6. Discharges resulting from the maintenance of potable water supply pipelines, tanks, reservoirs, etc.;
7. Discharges resulting from the disinfection of potable water supply pipelines, tanks, reservoirs, etc.;
8. Discharges from potable water supply systems resulting from initial system startup, routine startup, sampling of influent flow, system failures, pressure releases, etc.;
9. Discharges from fire hydrant testing or flushing;
10. Non-contact cooling water;
11. Air conditioning condensate;
12. Swimming pool discharge;

---

<sup>5</sup> Stormwater discharges were regulated under either the State's General Construction Activity permit or under the applicable county Municipal Storm Sewer System permit

13. Discharges resulting from diverted stream flows;
14. Decanted filter backwash wastewater and/or sludge dewatering filtrate water from water treatment facilities, and
15. Other similar types of wastes that pose a de minimus threat to water quality yet technically must be regulated under waste discharge requirements

## **B. Revised Regulatory Approach**

This Order takes a different approach from Order No. R8-2003-0061 in regulating certain types of discharges. The following lists the proposed changes and the rationale for them:

1. Discharges of the types listed in III.A.1., III.A.4. through III.A.9., and III.A.11. through III.A.13. to municipal separate storm sewer systems (MS4) from MS4 permittee activities within the Region will be regulated under this Order until the MS4 permits adopted by the Regional Water Board for the municipalities, cities and counties within the Region are re-issued with applicable terms and conditions necessary to address the regulation of these discharges. Reissuance of the permits is expected in early-mid 2009. Upon the adoption of MS4 permits that contain appropriate permit provisions, discharges of these types to the MS4 by the MS4 permittees will be regulated under the MS4 permits. Similarly, other waste discharge requirements issued by the Regional Water Board may be amended, as appropriate, in the future to address this de minimus discharges and thereby eliminate the need for coverage under this Order.

**Rationale:** These De minimus discharges, which in many cases consist of potable water, are or can be regulated under the area-wide MS4 permits or other waste discharge requirements. This approach streamlines the regulatory process for these dischargers. Where these discharges are to waters of the U.S. and not to the MS4, the discharges may continue to be regulated under this Order.

In all cases, the Regional Water Board retains the authority to issue separate waste discharge requirements for discharges of these types that, based on case-specific circumstances, are determined to have the potential for adverse water quality and/or beneficial use impacts.

2. Item III.A.10. - Non-contact cooling water<sup>6</sup> will no longer be regulated under this general permit. Open recirculating non-contact cooling water systems<sup>7</sup> are subject to metal corrosion, scale formation, and biological fouling, all of which can have a direct effect on system operating efficiency, reliability, longevity, and composition of the bleedoff sent to the drain. Chemical treatment products, such as tributyltin containing compounds, additives containing copper, zinc, hexavalent chromium and other organo-metallic compounds, are commonly used in the cooling water systems to address these problems. The constituents in these additives are or may be highly toxic to aquatic organisms and must be removed through additional treatment prior to discharge. Thus, non-contact cooling water discharges cannot be considered an insignificant threat to water quality and require regulation under separate waste discharge requirements. As a matter of information, no non-contact cooling water discharges have been authorized to be discharged under Order No. R8-2003-0061 or prior general de minimus orders adopted by the Regional Water Board.

### **C. Wastewater Treatment**

The most common treatment required for de minimus discharges is settling and/or dechlorination. Settling is used for those discharges with high settleable solids concentration. Discharges with residual chlorine, such as wastewater from hydro-testing of pipes and storage tanks, swimming pool drainage, and development and purging of wells, must be dechlorinated, unless the concentration is depleted by natural processes prior to mixing with the receiving water. If dechlorination is not accomplished naturally, the most common method of dechlorination is with the use of chemicals.

Those discharges with high concentrations of total dissolved solids, total inorganic nitrogen, selenium, phosphorous, and/or perchlorate may require advanced forms of treatment and may need to be covered under individual permits. Unless otherwise determined based on pollutant and/or site-specific circumstances, where wastewater discharges contain pollutant concentrations lower than established objectives, EPA priority pollutant water quality criteria, and/or maximum contaminant levels(MCLs) for drinking water, wastewater may be discharged without treatment as they pose no reasonable potential to affect the water quality or beneficial uses of receiving waters.

### **D. Discharge Points and Receiving Waters**

This Order authorizes permitted discharges to inland surface waters, estuarine, and ocean waters within the Santa Ana Region. In some cases, the de minimus discharges addressed by this Order are to storm drains or creeks that are typically dry in the summer. In these cases, the wastewater discharges percolate into the underlying groundwater management zones without reaching flowing surface water. During wet seasons, wastewater discharges are most oftentimes into flowing surface water. The beneficial uses of these receiving waters are described in Section IV.C.1., below.

---

<sup>6</sup> See Attachment A for definitions.

<sup>7</sup> See Attachment A for definitions.

### **E. Excluded Discharges:**

The following discharges are excluded from being regulated under this Order:

1. Wastewater with pollutants of concern for which no effluent limitations are specified in this Order.
2. Wastewater discharges from hydro-testing of contaminated pipes or contaminated vessels or tanks.
3. Wastewater discharges from draining of decorative ponds, golf course lakes and ponded water (irrigation tailwater that may commingle with stormwater), unless full characterization of the wastewater for the presence of pesticides, priority pollutants, insecticides, biocides and/or other chemicals that may have been applied to the wastewater is provided. There must be a demonstration that there are no pollutants present at levels of concern.

### **F. Compliance Summary - Not Applicable**

### **G. Planned Changes - Not Applicable**

## **IV. APPLICABLE PLANS, POLICIES, AND REGULATIONS**

The requirements contained in this Order are based on the requirements and authorities described in this section.

### **A. Legal Authorities**

This Order is issued pursuant to section 402 of the federal Clean Water Act (CWA) and its implementing regulations adopted by the USEPA, and chapter 5.5, division 7 of the California Water Code (commencing with section 13370). It shall serve as an NPDES permit for the point source discharges described herein to inland surface waters, estuarine, and ocean waters within the Santa Ana Region. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the California Water Code (commencing with section 13260).

Pursuant to NPDES regulations at 40 CFR 122.28, States may request authority to issue general NPDES permits. On June 8, 1989, the State Water Board applied to the USEPA requesting revisions to its NPDES Program in accordance with 40 CFR 122.28, 123.62, and 403.10, including a request to add general permit authority to its approved NPDES Program. On September 22, 1989, the USEPA, Region 9, approved the State Water Board's request, granting authorization for the State to issue general NPDES permits.

Pursuant to NPDES regulations at 40 CFR 122.28 (a) (2) general permits may be regulate point source discharges that:

1. Involve the same or substantially similar types of operations,
2. Discharge the same types of wastes,
3. Require the same effluent limitations,
4. Require the same or similar monitoring, and
5. In the opinion of the Executive Officer, are more appropriately controlled under a general permit than under individual permits.

## **B. California Environmental Quality Act (CEQA)**

Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of CEQA, Public Resources Code section 21000 et seq. (*County of Los Angeles v. California State Water Resources Control Board* (2006) 143 Cal.App.4th 985, mod. (Nov. 6, 2006, B184034) 50 Cal.Rptr.3d 619, 632-636.).

## **C. State and Federal Regulations, Policies, and Plans**

1. **Water Quality Control Plans.** The Regional Water Board adopted a Water Quality Control Plan for the Santa Ana Basin (hereinafter Basin Plan) that became effective on January 24, 1995. The Basin Plan designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. In addition, State Water Resources Control Board (State Water Board) Resolution No. 88-63 (Sources of Drinking Water Policy) requires that, with certain exceptions, the Regional Water Board assign the municipal and domestic water supply use to water bodies.

On January 22, 2004, the Regional Water Board adopted Resolution No. R8-2004-0001, amending the Basin Plan to incorporate revised boundaries for groundwater subbasins, now termed "management zones", new nitrate-nitrogen and TDS objectives for the new management zones, and new nitrogen and TDS management strategies applicable to both surface and ground waters. The State Water Resources Control Board and Office of Administrative Law (OAL) approved the N/TDS Amendment on September 30, 2004 and December 23, 2004, respectively. EPA approved the surface water standards components of the N/TDS Amendment on June 20, 2007.

The existing and potential beneficial uses of surface waters in the Santa Ana Region are designated in Chapter 3 of the Basin Plan and may include:

- a. Municipal and Domestic Supply,
- b. Agricultural Supply,
- c. Industrial Service Supply,
- d. Industrial Process Supply,
- e. Groundwater Recharge,
- f. Hydropower Generation,
- g. Water Contact Recreation,
- h. Non-contact Water Recreation
- i. Warm Freshwater Habitat,
- j. Limited Warm Freshwater Habitat,

- k. Cold Freshwater Habitat,
- l. Preservation of Biological Habitats of Special Significance,
- m. Wildlife Habitat,
- n. Marine Habitat,
- o. Shellfish Harvesting,
- p. Estuarine Habitat,
- q. Rare, Threatened or Endangered Species, and
- r. Spawning, Reproduction, and Development.

Many surface waters within the region recharge underlying groundwater basins. The existing and potential beneficial uses of groundwater within the Santa Ana Region are designated in Chapter 3 of the Basin Plan and generally include:

- a. Municipal and Domestic Supply,
- b. Agricultural Supply,
- c. Industrial Service Supply, and
- d. Industrial Process Supply

The State Water Board adopted a Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Water and Enclosed Bays and Estuaries of California (the Thermal Plan) on May 18, 1972, and amended this plan on September 18, 1975. This plan contains temperature objectives for surface waters of the State.

This Order implements applicable provisions of the Basin Plan and the Thermal Plan, as well as the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (State Implementation Policy or SIP)(see 3., below).

- 2. National Toxics Rule (NTR) and California Toxics Rule (CTR).** USEPA adopted the NTR on December 22, 1992, and later amended it on May 4, 1995, and November 9, 1999. Approximately forty water quality criteria in the NTR applied in California. On May 18, 2000, USEPA adopted the CTR, which established new criteria for toxics in the State and incorporated the previously adopted criteria of the NTR. The CTR was amended on February 13, 2001. The NTR and CTR contain water quality criteria for priority toxic pollutants applicable to inland surface waters, enclosed bays, and estuaries of the State.

- 3. State Implementation Policy.** On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP became effective on April 28, 2000, with respect to the priority pollutant criteria promulgated for California by the USEPA through the NTR and to the priority pollutant objectives established by the Regional Water Board in the Basin Plan. The SIP became effective on May 18, 2000, with respect to the priority pollutant criteria promulgated by the USEPA through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for toxicity control. Requirements of this Order implement the SIP.
- 4. Alaska Rule.** On March 30, 2000, at 40 CFR 131.32, USEPA revised its regulation that specifies when new and revised state and tribal water quality standards become effective for CWA purposes. [65 Fed. Reg. 24641 (April 27, 2000)] Under the revised regulation (also known as the Alaska Rule), new and revised standards submitted to USEPA after May 30, 2000 must be approved by USEPA before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA before May 30, 2000 may be used for CWA purposes, whether or not approved by USEPA.
- 5. Antidegradation Policy.** NPDES regulations require that State water quality standards include an antidegradation policy consistent with the federal policy established at 40 CFR 131.12. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16, which incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The Basin Plan implements and incorporates by reference both the state and federal antidegradation policies. The discharges authorized under this Order are expected to have an insignificant effect on water quality and beneficial uses and therefore conform to applicable antidegradation provisions of NPDES regulations at 40 CFR 131.12 and with State Water Board Resolution No. 68-16.
- 6. Anti-Backsliding Requirements.** CWA Sections 402 (o) (2) and 303 (d) (4) and NPDES regulations at 40 CFR 122.44 (l) prohibit backsliding in NPDES permits; i.e., effluent limitations in a reissued permit must be at least as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. This Order/General Permit is consistent with applicable anti-backsliding requirements. The limitations in this Order are not less stringent than those in the prior Orders/General Permits.

#### **D. Impaired Water Bodies on CWA 303(d) List/TMDLs**

Section 303(d) of the CWA requires states to identify water bodies where water quality standards are not expected to be met after technology-based effluent limitations have been implemented for point sources. For all 303(d)-listed water bodies and pollutants, the Regional Water Board has developed and/or plans to develop total maximum daily loads (TMDLs) that specify waste load allocations (WLA) for point sources and load allocations (LA) for non-point sources. These allocations form the basis, in part, for limitations in waste discharge requirements.

Since discharges will be regulated by this general permit only when they are determined to pose an insignificant threat to water quality, the discharges will not affect either the 303(d) listed bodies of water or TMDLs that have been or will be established to address identified impairments.

#### **E. Other Plans, Policies and Regulations**

In most areas of the watershed, there is no significant amount of receiving water at the point of discharge. Therefore, no mixing zone allowance is included in the calculation of effluent limits. Consequently, compliance with the effluent limits is required to be determined at the end of the discharge pipe or at a location prior to where the discharge enters the receiving water.

### **V. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS**

The CWA requires point source Dischargers to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations in the Code of Federal Regulations: section 122.44(a) requires that permits include applicable technology-based limitations and standards; and section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, WQBELs may be established: (1) using USEPA criteria guidance under CWA section 304 (a), supplemented where necessary by other relevant information; (2) on an indicator parameter for the pollutant of concern; or (3) using a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in 40 CFR 122.44(d)(1)(vi).

## **A. Discharge Prohibitions**

The discharge prohibitions are based on the Federal Clean Water Act, Basin Plan, State Water Resources Control Board's plans and policies, U.S. Environmental Protection Agency guidance and regulations, and previous permit Orders No. R8-2003-0061 provisions, and are consistent with the requirements set for other discharges regulated by NPDES permits adopted by the Regional Water Board.

## **B. Technology-Based Effluent Limitations**

### **1. Scope and Authority**

CWA Section 301 (b) and NPDES regulations at 40 CFR 122.44 require permits to, at a minimum, meet applicable technology-based requirements and any more stringent effluent limitations necessary to meet applicable water quality standards. The CWA requires the USEPA to develop effluent limitations, guidelines and standards (Effluent Limitations Guidelines - ELGs) representing application of best practicable treatment control technology (BPT), best available technology economically achievable (BAT), best conventional pollutant control technology (BCT), and best available demonstrated control technology for new sources (NSPS), for specific industrial categories. Where USEPA has not yet developed ELGs for a particular industry or a particular pollutant, Section 402 (a) (1) of the CWA and USEPA regulations at 40 CFR 125.3 authorize the use of best professional judgment (BPJ) to derive technology-based effluent limitations on a case-by-case basis. When BPJ is used, the permit writer must consider specific factors outlined at 40 CFR 125.3.

### **2. Applicable Technology-Based Effluent Limitations**

This Order does not establish technology-based effluent limitations.

## **C. Water Quality-Based Effluent Limitations (WQBELs)**

### **1. Scope and Authority**

Section 301(b) of the CWA and section 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards.

Section 122.44(d)(1)(i) mandates that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, water quality-based effluent limitations (WQBELs) must be established using: (1) USEPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in section 122.44(d)(1)(vi).

## **2. Applicable Beneficial Uses and Water Quality Criteria and Objectives**

The Order authorizes certain discharges to surface waters within the Santa Ana Region. Beneficial uses of these receiving waters, as designated by the Basin Plan (Chapter 3) are described in Section IV.C.1, Findings, of this Order.

- a. The Basin Plan (Chapter 4) specifies narrative and numeric water quality objectives applicable to surface water as follows.

TDS and TIN: TDS and TIN limitations are specified in the Order for discharges to surface waters. The proposed TDS/TIN limits for direct discharges into surface waters within the Santa Ana Region are based on the objectives specified in Table 4-1 of the Basin Plan, as amended.

In accordance with 40 CFR Section 122.45(d), there may be instances in which the basis for a limit for a particular continuous discharge may be impracticable to be stated as a maximum daily, average weekly, or average monthly effluent limitation. The Regional Water Board has determined that it is not practicable to express TDS and TIN effluent limitations as average weekly and average monthly effluent limitations because the TDS and TIN objectives in the Basin Plan were established to protect the underlying groundwater. Consequently, a 12-month average period is more appropriate.

## **3. Determining the Need for WQBELs**

NPDES regulations at 40 CFR 122.44(d)(1)(i) require permits to include WQBELs for all pollutants (non-priority or priority) "which the Director determines are or may be discharged at a level which will cause, have the reasonable potential to cause, or contribute to an excursion above any narrative or numeric criteria within a State water quality standard" (have Reasonable Potential). Thus, assessing whether a pollutant has Reasonable Potential is the fundamental step in determining whether or not a WQBEL is required.

#### **4. WQBEL Calculations**

No mixing zone allowance is included in the calculation of effluent limits in this Order and, consequently, compliance with the effluent limits is required to be determined at the end of the discharge pipe for freshwater discharge. If a Discharger requests that a mixing zone allowance be included in the determination of appropriate effluent limits, a dilution model must be provided for approval.

#### **5. Whole Effluent Toxicity (WET)-Not Applicable**

#### **D. Best Professional Judgment-Based Effluent Limitations**

This Order includes effluent limitations for total petroleum hydrocarbons, suspended solids, sulfides, and oil and grease that are based on best professional judgment. The limitations were established when the first general de minimus permit Order No. 93-49 was adopted by the Regional Water Board in 1993.

For filter backwash wastewater discharges, the proposed maximum daily effluent total suspended solids limit is 30 mg/L and is based on best professional judgment.

#### **E. Discharge Specifications**

Discharge Limitations established by this Order require authorized Dischargers to compare effluent data, generated through routine monitoring, to effluent limitations. Exceedance of any of the specified effluent limitations may trigger mandatory minimum penalties, accelerated monitoring for certain constituents and may lead to discontinuance of coverage under this General Permit. The Discharge Specifications impose specific effluent limitations to assure that authorized discharges are not creating adverse impacts on receiving water quality. When adverse impacts are identified following exceedance of effluent limitation(s), and/or violation of discharge prohibitions and provisions, Dischargers are either directed to mitigate impacts, to sewer or stop the discharge and/or to seek coverage under an individual NPDES permit.

#### **F. Final Effluent Limitations**

##### **1. Satisfaction of Anti-Backsliding Requirements**

All effluent limitations in this Order are the same as the effluent limitations in Order No. R8-2003-0061. Consequently, this Order conforms with anti-backsliding requirements.

## 2. Satisfaction of Antidegradation Policy

Discharges in conformance with the requirements of this Order will not result in a lowering of water quality and therefore conform to antidegradation requirements specified in Resolution No. 68-16, which incorporates the federal antidegradation policy at 40 CFR 131.12 where, as here, it is applicable.

## 3. Stringency of Requirements for Individual Pollutants

Both the beneficial uses and the water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. Apart from certain standards changes resulting from the N/TDS Basin Plan amendment, all beneficial uses and water quality objectives contained in the Basin Plan were approved under state law and submitted to and approved by USEPA prior to May 30, 2000. Any water quality objectives and beneficial uses submitted to USEPA prior to May 30, 2000, but not approved by USEPA before that date, are nonetheless “applicable water quality standards for purposes of the CWA” pursuant to section 131.21(c)(1). Collectively, this Order’s restrictions on individual pollutants are no more stringent than required to implement the requirements of the CWA.

**Table 1. Effluent Limitations Applicable to All Receiving Waters**

| Constituent                          | Maximum Daily Concentration Limit (mg/l)        |
|--------------------------------------|---|
| Total Dissolved Solids (TDS)         | Table 4-1 of the Basin Plan for Santa Ana River |
| Total Inorganic Nitrogen (TIN)       | Table 4-1 of the Basin Plan for Santa Ana River |
| Total Petroleum Hydrocarbons         | 0.1 mg/L  |
| Total Residual Chlorine <sup>8</sup> | 0.1 mg/L  |
| Suspended Solids                     | 75 mg/L   |
| Sulfides                             | 0.4 mg/L  |
| Oil and Grease                       | 15 mg/L   |

Filter backwash wastewater shall meet a maximum total suspended solids daily limit of 30 mg/L.

### **F. Interim Effluent Limitations – Not Applicable**

### **G. Land Discharge Specifications – Not Applicable**

### **H. Reclamation Specifications – Not Applicable**

## **VI. RATIONALE FOR RECEIVING WATER LIMITATIONS**

### **A. Surface Water**

The surface water receiving water limitations in the proposed Order are based upon the water quality objectives contained in the Basin Plan and are a required part of this Order.

### **B. Groundwater**

The receiving groundwater limitations in the proposed Order are based upon the water quality objectives contained in the Basin Plan.

## **VII. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS**

Section 122.48 of 40 CFR requires all NPDES permits to specify recording and reporting of monitoring results. Sections 13267 and 13383 of the CWC authorize the Water Boards to require technical and monitoring reports. The MRP, Attachment E of this Order, establishes monitoring and reporting requirements to implement federal and state requirements. The following provides the rationale for the monitoring and reporting requirements contained in the MRP for this facility.

The principal purposes of a monitoring program by a Discharger are to:

1. Document compliance with waste discharge requirements and prohibitions established by the Regional Water Board,
2. Facilitate self-policing by the Discharger in the prevention and abatement of pollution arising from waste discharge,
3. Develop or assist in the development of limitations, discharge prohibitions, national standards of performance, pretreatment and toxicity standards, and other standards, and to
4. Prepare water and wastewater quality inventories.

The MRP is a standard requirement in almost all NPDES permits issued by the Regional Water Board, including this Order. It contains definitions of terms, specifies general sampling and analytical protocols, and sets out requirements for reporting of spills, violations, and routine monitoring data in accordance with NPDES regulations and the California Water Code.

Monitoring is the primary means of ensuring that waste discharge requirements are met. It is also the basis for enforcement actions against Dischargers who are in violation of the waste discharge requirements issued by the Regional Water Board. All Dischargers enrolled under this general permit will be required to conduct monitoring in accordance with a monitoring program issued by the Executive Officer. Each monitoring and reporting program will be customized for each enrollee based on the characteristics of the groundwater being treated and discharged. The typical required constituents and frequency of analyses are tabulated in the self-monitoring program attached to this general

permit as "Attachment E." This monitoring and reporting program will be revised as appropriate. An increase of the parameters or frequency of monitoring will be required when monitoring data show the presence of petroleum hydrocarbons that are not limited in this Order, or toxicity test failures. A reduction of the parameters or frequency of monitoring may be implemented with prior approval of the Executive Officer when monitoring data demonstrate that such reduction is warranted.

In addition, the monitoring program includes analyses for additional constituents to determine the overall impact of individual discharges and to screen for unexpected contaminants.

Specifically for filter backwash wastewater discharges, the proposed Order requires monitoring for iron, manganese and aluminum for those water treatment facilities that have the potential for discharging such constituents.

#### **A. Influent Monitoring – Not Applicable**

#### **B. Effluent Monitoring**

The Discharger is required to conduct monitoring of the permitted discharges in order to evaluate compliance with permit conditions and to allow ongoing characterization of discharges to determine potential adverse impacts and to determine continued suitability for coverage under the General Permit. Monitoring requirements are given in the proposed monitoring and reporting program (Attachment E). This provision requires compliance with the monitoring and reporting program, and is based on 40 CFR 122.44(i), 122.62, 122.63 and 124.5. The self monitoring program (SMP) is a standard requirement in almost all NPDES permits (including the proposed Order) issued by the Regional Water Board. In addition to containing definitions of terms, it specifies general sampling/analytical protocols and the requirements of reporting of spills, violations, and routine monitoring data in accordance with NPDES regulations, the California Water Code, and Regional Water Board's policies. Pollutants to be monitored include all pollutants for which effluent limitations are specified.

In addition to discharge rate, effluent is monitored for hardness, pH, total suspended and total dissolved solids. Annual monitoring for the full priority pollutants is no longer required since reported priority pollutant monitoring data show absence of most of the pollutants. However, annual monitoring is required for certain pollutants which have been determined to have high probability of being present in the discharges, though typically at insignificant concentrations. These pollutants are listed in Attachment I, "Trigger Table". This list was determined from evaluating monitoring data from facilities regulated under the de minimus permit and the groundwater cleanup general permit Order Nos. R8-2003-0061 and R8-2007-0008, respectively.

#### **C. Whole Effluent Toxicity Testing Requirements – Not Applicable**

#### **D. Receiving Water Monitoring - Not Applicable**

The MRP does not require characterization of receiving waters because the discharges are not expected to have an insignificant impact on water quality.

#### **E. Other Monitoring Requirements - Not Applicable**

### **VIII. RATIONALE FOR PROVISIONS**

#### **A. Standard Provisions**

Standard Provisions, which apply to all NPDES permits in accordance with section 122.41, and additional conditions applicable to specified categories of permits in accordance with section 122.42, are provided in Attachment D. The Discharger must comply with all standard provisions and with those additional conditions that are applicable under section 122.42.

40 CFR 122.41(a)(1) and (b) through (n) establish conditions that apply to all State-issued NPDES permits. These conditions must be incorporated into the permits either expressly or by reference. If incorporated by reference, a specific citation to the regulations must be included in this Order. Section 123.25(a)(12) allows the state to omit or modify conditions to impose more stringent requirements. In accordance with section 123.25, this Order omits federal conditions that address enforcement authority specified in sections 122.41(j)(5) and (k)(2) because the enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates by reference Water Code section 13387(e).

#### **B. Special Provisions**

##### **1. Reopener Provisions**

This provision is based on 40 CFR Part 123. The Regional Water Board may reopen the permit to modify permit conditions and requirements. Causes for modifications include the promulgation of new regulations, or adoption of new regulations by the State Board or Regional Water Board, including revisions to the Basin Plan.

##### **2. Special Studies and Additional Monitoring Requirements – Not Applicable**

##### **3. Best Management Practices and Pollution Prevention – Not Applicable**

##### **4. Construction, Operation, and Maintenance Specifications – Not Applicable**

##### **5. Special Provisions for Municipal Facilities - Not Applicable**

## **6. Other Special Provisions**

- a. In some instances, Dischargers have continued to discharge wastewater that does not comply with effluent limitations and/or exceeds concentration values for one or more of the constituents listed in Attachment I. To address this, the monitoring program (Attachment E) requires accelerated monitoring of constituents that are detected at concentrations that are greater than applicable effluent limits and/or above the pollutant values listed in Attachment I. If the results of two consecutive monitoring samples collected pursuant to the accelerated monitoring program exceed effluent limits and/or greater than the pollutant values listed in Attachment I, and/or equal or exceed the maximum contaminant level (MCL) or Reporting Level values listed in the Attachment I, the Order requires the Discharger to cease discharging (see Provision VII.C.6.a. of the Order). In this event, the Order also requires the Discharger to notify the Regional Water Board to determine a further course of action. Alternatives may include sewerage the discharge or regulating the discharge under an individual permit or under a different general permit that addresses the type of pollutant(s) encountered at the site.

## **7. Compliance Schedules – Not Applicable**

## **IX. PUBLIC PARTICIPATION**

The California Regional Water Quality Control Board, Santa Ana Region (Regional Water Board) is considering the issuance of waste discharge requirements (WDRs) that will serve as a National Pollutant Discharge Elimination System (NPDES) general permit for discharges to surface waters that pose an insignificant (de minimus) threat to water quality within the Santa Ana Region. The Regional Water Board encourages public participation in the WDR adoption process.

### **A. Notification of Interested Parties**

The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe waste discharge requirements for the discharge and has provided them with an opportunity to submit their written comments and recommendations. Notification was provided through the posting of Notice of Public Hearing at the Regional Water Board website:

[http://www.waterboards.ca.gov/santaana/board\\_decisions/tentative\\_orders/index.shtml](http://www.waterboards.ca.gov/santaana/board_decisions/tentative_orders/index.shtml)  
on December 24, 2008 and publication in the Orange County Register, The Sun, and The Press Enterprise on December 19, 2008.

## **B. Written Comments**

The staff determinations are tentative. Interested persons are invited to submit written comments concerning these tentative WDRs. Comments must be submitted either in person or by mail to the Executive Office at the Regional Water Board at the address above on the cover page of this Order.

To be fully responded to by staff and considered by the Regional Water Board, written comments should be received at the Regional Water Board offices by 5:00 p.m. on March 9, 2009 to:

Jane Qiu  
California Regional Water Quality Control Board  
Santa Ana Region  
3737 Main Street, Suite 500  
Riverside, CA 92501-3348

## **C. Public Hearing**

The Regional Water Board will hold a public hearing on the tentative WDRs during its regular Board meeting on the following date and time and at the following location:

Date: March 27, 2009  
Time: 9:00 A.M.  
Location: City Council Chambers of Loma Linda  
25541 Barton Road  
City of Loma Linda, CA

Interested persons are invited to attend. At the public hearing, the Regional Water Board will hear testimony, if any, pertinent to the discharge, WDRs, and permit. Oral testimony will be heard; however, for accuracy of the record, important testimony should be in writing.

Please be aware that dates and venues may change. Our web address <http://www.waterboards.ca.gov/santaana> where you can access the current agenda for changes in dates and locations.

#### **D. Waste Discharge Requirements Petitions**

Any aggrieved person may petition the State Water Resources Control Board to review the decision of the Regional Water Board regarding the final WDRs. The petition must be submitted within 30 days of the Regional Water Board's action to the following address:

State Water Resources Control Board  
Office of Chief Counsel  
P.O. Box 100, 1001 I Street  
Sacramento, CA 95812-0100

#### **E. Information and Copying**

The Report of Waste Discharge (RWD), related documents, tentative effluent limitations and special provisions, comments received, and other information are on file and may be inspected at the address above at any time between 9:00 a.m. and 3:00 p.m. Monday through Friday. Copying of documents may be arranged through the Regional Water Board by calling (951) 782-4130.

#### **F. Register of Interested Persons**

Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board, reference this facility, and provide a name, address, and phone number.

#### **G. Additional Information**

Requests for additional information or questions regarding this Order should be directed to Jane Qiu at (951) 320-2008.

## ATTACHMENT H – MINIMUM LEVELS

### MINIMUM LEVELS IN PPB (µg/l)

| Table 1- VOLATILE SUBSTANCES <sup>1</sup>     | GC  | GCMS |
|---|-----|------|
| Acrolein                                      | 2.0 | 5    |
| Acrylonitrile                                 | 2.0 | 2    |
| Benzene                                       | 0.5 | 2    |
| Bromoform                                     | 0.5 | 2    |
| Carbon Tetrachloride                          | 0.5 | 2    |
| Chlorobenzene                                 | 0.5 | 2    |
| Chlorodibromomethane                          | 0.5 | 2    |
| Chloroethane                                  | 0.5 | 2    |
| Chloroform                                    | 0.5 | 2    |
| Dichlorobromomethane                          | 0.5 | 2    |
| 1,1 Dichloroethane                            | 0.5 | 1    |
| 1,2 Dichloroethane                            | 0.5 | 2    |
| 1,1 Dichloroethylene                          | 0.5 | 2    |
| 1,2 Dichloropropane                           | 0.5 | 1    |
| 1,3 Dichloropropylene (volatile)              | 0.5 | 2    |
| Ethylbenzene                                  | 0.5 | 2    |
| Methyl Bromide ( <i>Bromomethane</i> )        | 1.0 | 2    |
| Methyl Chloride ( <i>Chloromethane</i> )      | 0.5 | 2    |
| Methylene Chloride ( <i>Dichloromethane</i> ) | 0.5 | 2    |
| 1,1,2,2 Tetrachloroethane                     | 0.5 | 1    |
| Tetrachloroethylene                           | 0.5 | 2    |
| Toluene                                       | 0.5 | 2    |
| trans-1,2 Dichloroethylene                    | 0.5 | 1    |
| 1,1,1 Trichloroethane                         | 0.5 | 2    |
| 1,1,2 Trichloroethane                         | 0.5 | 2    |
| Trichloroethylene                             | 0.5 | 2    |
| Vinyl Chloride                                | 0.5 | 2    |
| 1,2 Dichlorobenzene (volatile)                | 0.5 | 2    |
| 1,3 Dichlorobenzene (volatile)                | 0.5 | 2    |
| 1,4 Dichlorobenzene (volatile)                | 0.5 | 2    |

### Selection and Use of Appropriate ML Value:

ML Selection: When there is more than one ML value for a given substance, the discharger may select any one of those ML values, and their associated analytical methods, listed in this Attachment that are below the calculated effluent limitation for compliance determination. If no ML value is below the effluent limitation, then the discharger shall select the lowest ML value, and its associated analytical method, listed in the PQL Table.

ML Usage: The ML value in this Attachment represents the lowest quantifiable concentration in a sample based on the proper application of all method-based analytical procedures and the absence of any matrix interferences. Assuming that all method-specific analytical steps are followed, the ML value will also represent, after the appropriate application of method-specific factors, the lowest standard in the calibration curve for that specific analytical technique. Common analytical practices sometimes require different treatment of the sample relative to calibration standards.

Note: chemical names in parenthesis and italicized is another name for the constituent.

<sup>1</sup> The normal method-specific factor for these substances is 1, therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance.

## MINIMUM LEVELS IN PPB (µg/l)

| <b>Table 2 – Semi-Volatile Substances<sup>2</sup></b> | <b>GC</b> | <b>GCMS</b> | <b>LC</b> |
|---|-----------|-------------|-----------|

<sup>2</sup> With the exception of phenol by colorimetric technique, the normal method-specific factor for these substances is 1000, therefore, the lowest standards concentration in the calibration curve is equal to the above ML value for each substance multiplied by 1000.

<sup>3</sup> Phenol by colorimetric technique has a factor of 1.

<sup>4</sup> The normal method-specific factor for these substances is 1, therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance.

Techniques:

GC - Gas Chromatography

GCMS - Gas Chromatography/Mass Spectrometry

HRGCMS - High Resolution Gas Chromatography/Mass Spectrometry (i.e., EPA 1613, 1624, or 1625)

LC - High Pressure Liquid Chromatography

FAA - Flame Atomic Absorption

GFAA - Graphite Furnace Atomic Absorption

HYDRIDE - Gaseous Hydride Atomic Absorption

CVAA - Cold Vapor Atomic Absorption

ICP - Inductively Coupled Plasma

ICPMS - Inductively Coupled Plasma/Mass Spectrometry

SPGFAA - Stabilized Platform Graphite Furnace Atomic Absorption (i.e., EPA 200.9)

DCP - Direct Current Plasma

COLOR - Colorimetric

<sup>5</sup>

*The normal method-specific factor for these substances is 100, therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance multiplied by 100.*

### Notes:

1. For constituents not shown italicized, the values shown in the Table 1 are the most stringent applicable receiving water objectives (freshwater or human health (consumption of water and organisms) as specified for that pollutant in 40 CFR 131.38<sup>6</sup>).
2. For constituents shown bold and italicized, the values shown in the Table are based on the California Department of Public Health maximum contaminant levels (MCLs) or Notification Level. Notification Level based triggers are underlined.
3. For hardness dependent metals, Table 5 shows the calculated metals criteria for Reach 3 and 4 of the Santa Ana River. For other freshwater discharge locations see Table 6. Calculated metal criteria values are based on specific hardness values in 50 mg/L increments.
4. For ocean discharges see Table 3. For bays, estuaries see Table 4.

State of California  
California Regional Water Quality Control Board  
Santa Ana Region

November 30, 2007

ITEM: 13

SUBJECT: Issuance of general discharge permit for discharges to surface waters of groundwater resulting from groundwater dewatering operations and/or groundwater cleanup activities at sites within the San Diego Creek/Newport Bay Watershed polluted by petroleum hydrocarbons, solvents, metals and/or salts - Order No. R8-2007-0041, NPDES NO. CAG918002

**DISCUSSION:**

See attached Order No. R8-2007-0041 and Attachments

**RECOMMENDATIONS:**

Adopt Order No. R8-2007-0041, NPDES No. CAG918002 as presented.

**COMMENT SOLICITATION:**

Comments were solicited from the dischargers and the following agencies:

U.S. Environmental Protection Agency, Permits Issuance Section (WTR-5) – Doug Eberhardt  
U.S. Army District, Los Angeles, Corps of Engineers - Regulatory Branch  
U.S. Fish and Wildlife Service, Carlsbad  
State Water Resources Control Board, Office of the Chief Counsel – Erik Spiess  
State Department of Water Resources, Glendale  
State Department of Fish and Game, Ontario  
California Coastal Commission – Carl Schwing  
California Department of Public Health, Santa Ana - Anthony Nhan  
California Department of Public Health, San Diego – Steve Williams  
California Department of Public Health, San Bernardino – Sean McCarthy  
San Bernardino County Flood Control and Transportation Department - Naresh Varma  
Riverside County Flood Control and Water Conservation District – Jason Uhley  
Orange County Public Facilities and Resources Department, Flood Control – Andy Ngo  
Orange County Health Care Agency - Seth Daugherty  
Orange County Resources and Development Management Department - Chris Crompton  
Orange County Planning & Development Services Department  
Orange County Water District - Nira Yamachika  
South Coast Air Quality Management District – Dr. Barry R. Wallerstein  
Orange County Coastkeeper - Garry Brown

Lawyers for Clean Water C/c San Francisco Baykeeper

**ORDER NO. R8-2007-0041**  
**NPDES NO. CAG918002**

### GENERAL DISCHARGE PERMIT FOR DISCHARGES TO SURFACE WATERS OF GROUNDWATER RESULTING FROM GROUNDWATER DEWATERING OPERATIONS AND/OR GROUNDWATER CLEANUP ACTIVITIES AT SITES WITHIN THE SAN DIEGO CREEK/NEWPORT BAY WATERSHED POLLUTED BY PETROLEUM HYDROCARBONS, SOLVENTS, METALS AND/OR SALTS

A Discharger, as described in the following table, who has complied with the requirements for coverage under this Order, is authorized to discharge under this Order, once permit coverage is effective, as described in this Order.

|                    |  |
|--------------------|--|
| <b>Dischargers</b> | Parties within the San Diego Creek/Newport Bay Watershed who conduct dewatering operations or groundwater remediation at sites that have been polluted by petroleum hydrocarbons, solvents, metals and/or salts, etc., and propose to discharge groundwater to surface waters. |
|--------------------|--|

|   |                          |
|---|--------------------------|
| This Order was adopted by the Regional Water Quality Control Board on:  | <b>November 30, 2007</b> |
| This Order shall become effective on:   | <b>November 30, 2007</b> |
| This Order shall expire on:   | <b>November 1, 2012</b>  |
| The U.S. Environmental Protection Agency (USEPA) and the Regional Water Quality Control Board have classified this discharge as a <b>minor</b> discharge. |                          |

IT IS HEREBY ORDERED, that in order to meet the provisions contained in division 7 of the Water Code (commencing with section 13000) and regulations adopted thereunder, and the provisions of the federal Clean Water Act (CWA) and regulations and guidelines adopted thereunder, the Discharger shall comply with the requirements in this Order.

I, Gerard J. Thibeault, Executive Officer, do hereby certify that this Order with all attachments is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on November 30, 2007.

Gerard J. Thibeault, Executive Officer

SANTA ANA REGIONAL WATER QUALITY CONTROL BOARD

## **I. DISCHARGE INFORMATION**

Order No. R8-2007-0008, NPDES No. CAG918001 is a general NPDES permit adopted by the Regional Water Board on February 2, 2007 for discharges to surface waters of extracted and treated groundwater resulting from the cleanup of groundwater polluted by petroleum hydrocarbons and/or solvents at service stations and similar sites.

Order No. R8-2004-0021, NPDES No. CAG998002 is a general NPDES permit adopted by the Regional Water Board on December 20, 2004 for short-term groundwater-related discharges and de minimus wastewater discharges to surface waters within the San Diego Creek/Newport Bay watershed. Groundwater dewatering discharges in the San Diego Creek/ Newport Bay watershed cannot be classified as de minimus due to the frequent presence of nitrates and selenium in shallow groundwater. Total maximum daily loads (TMDLs) for nitrates and selenium in the watershed have been established.

Individually, these general Orders facilitated the processing of permit applications and the early implementation of projects regulated under each general permit within the Santa Ana Region. However, there are certain projects that necessitate regulation under both general permits (e.g., a short-term groundwater dewatering project may intercept a groundwater contaminant plume during dewatering operations).

This general permit will regulate discharges of treated wastewater from groundwater dewatering and/or groundwater remediation activities at sites polluted by petroleum hydrocarbons, solvents, metals and/or salts within the San Diego Creek/Newport Bay watershed.

## **II. GENERAL PERMIT APPLICATION**

### **A. New Dischargers**

At least 180 days before the start of a new discharge, the Discharger shall submit an application and obtain the authorization letter from the Executive Officer to discharge groundwater to surface waters. The application shall include the following information:

1. Notice of Intent to be covered under this general permit.
2. A site characterization study that defines the onsite contaminants petroleum hydrocarbons, solvents, metals and/or salts and their properties and the three-dimensional extent and concentration of contaminants in the subsurface, and includes a description of the geologic and hydrologic factors that control the migration of the contaminants.
3. An evaluation of the selenium concentrations in proposed discharges and a determination of whether immediate compliance with the numeric effluent limitations specified in this Order for individual constituents is feasible. If immediate compliance is feasible, then the Discharger can, upon authorization under this Order, discharge in accordance with the numeric effluent limitations and with the

remaining terms and conditions of this Order. If immediate compliance with the numeric selenium limitations is infeasible, then the Discharger must demonstrate that it is not reasonably possible to reduce or eliminate the discharge to surface waters. If it is demonstrated that it is not reasonably feasible to reduce or eliminate the discharge, then the Discharger must either (a) submit for approval by the Executive Officer a proposed plan and schedule that assures that selenium discharges in excess of those allowed pursuant to the effluent limitations will be offset on at least a one-to-one basis, or as determined by the Regional Water Board's Executive Officer; or, (b) demonstrate that the Discharger is a participating member of the Nitrogen and Selenium Management Program (NSMP) Working Group.

Any proposed selenium offset must assure that there is no net loading of selenium to surface waters within the San Diego Creek/Newport Bay watershed. Dischargers who pursue a selenium offset are required to identify a plan and schedule for implementation of the offset prior to commencing any new discharge, and are required to implement that plan and schedule upon approval by the Executive Officer. This plan/schedule is to reflect the shortest practicable time necessary to provide the offset. In no case shall this schedule extend beyond December 20, 2009. It is recognized that the offset may not be completed within the time frame of the actual discharge; therefore, in filing a Notice of Intent to obtain authorization to discharge under this Order, these Dischargers are required to acknowledge explicitly that no notice of termination will be issued and that compliance with this Order will continue to be required and enforced until such time as the offset is satisfactorily completed.

4. An evaluation of the nitrogen concentrations in proposed discharges and a determination of whether immediate compliance with the numeric effluent limitations specified in this Order for surface water discharges of nitrogen is feasible. A description of how a 50% reduction in nutrient discharges will be achieved if nitrogen is present in the discharges. If it is demonstrated that it is not reasonably feasible to achieve immediate compliance with the 50% reduction, then the Discharger is required to (1) identify a proposed plan and schedule whereby the 50% reduction will be achieved within the shortest practicable time, or (2) identify a proposed plan and schedule for implementation of a nitrogen offset. The nitrogen offset program must (a) assure the reduction of nitrogen loading to surface waters equivalent to the requisite 50% reduction, (b) assure the completion of the offset in the shortest practicable time, and (c) be implemented upon approval by the Executive Officer. It is recognized that the offset may not be completed within the time frame of the actual discharge; therefore, in filing a Notice of Intent to obtain authorization to discharge under this Order, these Dischargers are required to acknowledge explicitly that no notice of termination will be issued and that compliance with this Order will continue to be required and enforced until such time as the offset is satisfactorily completed.

5. The Discharger shall submit for approval by the Executive Officer of the Regional Water Board a fixed hardness value based on the 5th percentile of effluent hardness measurements or the average ambient receiving water hardness measurements for those sites polluted with metals (lead, cadmium, copper, chromium (III), nickel, silver, and zinc).
6. A report that shall include the following:
  - a. Chemical analysis of the untreated groundwater. A representative groundwater sample shall be analyzed for organic pollutants using EPA method 8260B or equivalent. The characterization of the groundwater shall include total arsenic, total recoverable cadmium, total recoverable chromium VI, total recoverable copper, total recoverable lead, total recoverable mercury, total recoverable nickel, total recoverable selenium, total recoverable zinc, organochlorine compounds (Total Chlordane, Total DDT, Toxaphene, and PCBs), dissolved oxygen (DO), sulfate, chloride, electrical conductivity, total dissolved solids, total suspended solids, total nitrogen, total inorganic nitrogen, hardness, and priority pollutants including 1,4-dioxane and perchlorate. The selenium analysis used shall assure analytical detection levels sufficient to assess compliance with the effluent limitations of this Order. Test results shall be reported with Minimum levels (ML) and method detection limit (MDL); laboratory analytical limits shall be sufficient to detect these constituents at the concentrations listed in Tables 1, 2, 3, 4, and Attachment H. If the results of this analysis demonstrate that compliance with the nitrate or selenium limitations in this Order cannot be achieved, Dischargers who are participating in the Nitrogen and Selenium Management Program (NSMP) Working Group shall comply with sub-paragraph V.A.1.b., below: Dischargers who are not participating in the Working Group shall comply with sub-paragraph II.A.5.a.(1), below.
    - (1) If not a member of the Working Group, the Discharger shall identify and assess selenium and nitrogen control and reduction BMPs, including volume-reduction techniques. Together with the NOI, the Discharger shall submit for approval by the Executive Officer a proposed plan and schedule for identifying, evaluating and implementing these BMPs. The BMP evaluation shall include consideration of potential positive and negative impacts that may result from the BMPs. The schedule shall reflect the shortest practicable time frame for the completion of the identified tasks. (see also Provisions VII.C.3.b., below).
  - b. The name of the proposed receiving water body, including the location (Latitude and Longitude) of the discharge point (s);
  - c. The estimated average and maximum daily flow rates, the start date of discharge (if a new discharge), and the duration of the discharge, and the estimated total volume of the discharge;
  - d. A map showing the path from the point of initial discharge to the ultimate location of discharge;

- e. A list of known or suspected leaking underground tanks and other facilities or operations that have, or may have impacted the quality of the underlying groundwater within the expected radius of influence of the project.
  - f. A discussion of the proposed dewatering and or cleanup project (if appropriate), including a review of the extraction system design and the status of definition of free product and dissolved product plumes for sites contaminated with petroleum hydrocarbon or solvents only (as appropriate);
  - g. A description of the proposed treatment system (if appropriate) and a certification report on the adequacy of each component of the proposed treatment system. This certification report shall contain a requirement-by-requirement analysis, based on accepted engineering practice, of how the process(es) and physical design(s) of the treatment system will ensure compliance with this Order. The design engineer shall affix his/her signature and engineering license number to this certification report. The report(s) shall also certify the following:
    - (1) all treatment facility startup and operation instruction manuals are adequate and available to operating personnel;
    - (2) all treatment facility maintenance and testing schedules are included in the treatment facility operation and maintenance manual (O&M Manual), which shall be kept readily accessible to onsite operating personnel; and
    - (3) influent and effluent sampling locations and ports are located in areas where samples representative of the waste stream to be monitored can be obtained.
  - h. A discussion of a plan for the prevention of run-on, interception and diversion of runoff, and prevention of infiltration and runoff from contaminated soils stored on-site, if the discharge is associated with a groundwater remediation project and soils containing petroleum projects or other pollutants will be maintained on-site.
  - i. Any other information deemed necessary by the Executive Officer.
7. The General Permit Application, including the NOI (see Attachment A of this Order), map(s), report, and fee, must be submitted to the following address:

Permitting Section  
California Regional Water Quality Control Board  
3737 Main Street, Suite 500  
Riverside, CA 92501-3348

## **B. Existing Dischargers**

1. Within forty five (45) days of the effective date of this Order, existing Dischargers within the San Diego Creek/Newport Bay watershed who are regulated under Order No. R8-2007-0008 and/or Order No. R8-2004-0021, and those Dischargers under individual waste discharge requirements who wish to be regulated under this Order, shall submit a copy of their current monitoring and reporting programs along with the Notice of Intent for this general permit. For Dischargers covered under only Order No. R8-2004-0021, the Notice of Intent must be filed only if the expected duration of

the discharge is more than one year from the date of initiation of the discharge. Additional information may be required if there has been a change in ownership of facility or changes in the character and/or treatment of the discharges

2. For existing Dischargers who have coverage under Order No. R8-2004-0021 for short-term groundwater-related discharges within the San Diego Creek/Newport Bay watershed and who do not participate in the Working Group, and for existing individual Dischargers who wish to obtain coverage under this general permit and who do not participate in the Working Group, when the results of selenium analysis required to be submitted as part of the Notice of Intent demonstrate non-compliance with the effluent limitations for selenium specified in this Order (Discharge Specification V.A.1.a.), the Discharger(s) shall:
  - a. Also submit with the Notice of Intent a demonstration that it is not reasonably feasible to reduce or eliminate the discharge;
  - b. Submit for approval a plan and schedule to offset selenium discharges in excess of those allowed pursuant to the effluent limitations of this Order. The plan/schedule is to reflect the shortest practicable time necessary to provide the offset;
  - c. Collect data on flow and selenium quality to assure that ongoing selenium discharges are properly accounted for and offset, pending development, approval and implementation of the offset plan;
  - d. Implement the offset plan upon approval by the Executive Officer; and
  - e. Acknowledge explicitly, as part of the Notice of Intent, that no notice of termination will be issued until such time as any requisite selenium offset is satisfactorily completed.
3. For freshwater discharges, within forty five (45) days of the effective date of this Order, Dischargers from those sites polluted with leaded gasoline or metals shall submit for approval by the Regional Water Board Executive Officer the proposed hardness value based on 5th percentile of effluent hardness measurements or the average ambient freshwater receiving water hardness measurements. Once approved by the Executive Officer, this hardness value shall be the basis for determining the lead/metals effluent limits for the discharge from Attachment "J" of this Order.
4. Each Discharger shall submit to the Executive Officer, as part of the application for proposed discharge, a report certifying the adequacy of each component of the proposed treatment system and the associated Operation and Maintenance (O&M) Manual. This certification shall contain a requirement-by-requirement analysis, based on accepted engineering practice, of how the process and physical design of the treatment systems will ensure compliance with this Order. The design engineer<sup>1</sup> shall affix his/her signature, professional license number and seal to this certification.

---

<sup>1</sup> A registered civil engineer, registered geologist, or certified engineering geologist licensed in the State of California (Sections 6735, 7835, and 7835.1 of the California Business and Profession's Code).

### **C. General Permit Coverage**

Permit coverage will be effective when the Discharger has submitted a complete application and the Regional Water Board Executive Officer issues a discharge authorization letter<sup>2</sup> accompanied with the self monitoring program for the proposed discharge.

### **D. Termination of Coverage**

The Discharger shall inform the Regional Water Board by a letter if coverage under the permit is no longer needed. The Regional Water Board Executive Officer or designee shall issue a letter terminating coverage under the general permit. Permit coverage will be terminated only for those projects that have complied with all permit requirements. (See also Provisions Section VII.A.3.)

### **E. Changes from Authorization Under General Permit To Individual Permit.**

Dischargers already covered under the NPDES program, whether by general or individual permit, may elect to continue coverage under the existing valid permit(s) or may submit a complete application for coverage under this General Permit. Dischargers who submit a complete application under this General Permit are not required to submit an individual permit application. The Regional Water Board may request additional information and determine that a Discharger is not eligible for coverage under this General Permit and would be better regulated under an individual or other general NPDES permit or, for discharges to land, under waste discharge requirements (WDRs). If the Regional Water Board issues an NPDES permit or WDRs, the applicability of this General Permit to the specified discharge is immediately terminated on the effective date of the individual NPDES permit or WDRs.

## **III. FINDINGS**

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Water Board), finds:

---

<sup>2</sup>

*The issuance by the Executive Officer of authorization to discharge under the terms and conditions of this Order is contingent on the satisfactory demonstration that termination/reduction of the discharge is not reasonably feasible.*

## A. Background.

Dischargers enrolled under Order No. R8-2007-0008 and/or Order No. R8-2004-0021<sup>3</sup> who discharge or propose to discharge treated wastewaters from dewatering and or groundwater remediation activities at sites polluted by petroleum hydrocarbons, solvents, metals and/or salts within the San Diego Creek/Newport Bay watershed must obtain coverage under this new Order. To obtain authorization for continued and future discharge to waters of the United States, Dischargers must submit a complete application, as described in II.A., or II.B., above, and obtain coverage in order to be regulated under this General Permit as provided in 40 Code of Federal Regulations<sup>4</sup> (CFR) section 122.28 (b)(2).

For the purposes of this Order, references to the “discharger” or “permittee” in applicable federal and State laws, regulations, plans, or policy are held to be equivalent to references to the Discharger herein.

## B. Wastewater Description.

This Order regulates discharges to surface water from groundwater dewatering activities at construction development sites and/or discharges from temporary (mobile) or permanent groundwater remediation systems, operated to clean up groundwater contamination from petroleum hydrocarbons, solvents, metals and/or salts. The discharges are to inland fresh and Bay waters within the San Diego Creek/Newport Bay Watershed of the Santa Ana Region. (see additional discussions in the Fact Sheet Attachment F).

Adoption of this general permit is necessary to assure proper regulatory oversight of groundwater-related discharges within the San Diego Creek/Newport Bay watershed. As a matter of regulatory streamlining, this permit will regulate discharges within the San Diego Creek/Newport Bay watershed in lieu of coverage of these discharges under Order No. R8-2007-0008 and Order No. R8-2004-0021.

In summary, this general permit will regulate discharges from activities involving groundwater dewatering and groundwater remediation in areas where contamination from petroleum hydrocarbons, solvents, metals and/or salts may be present. These activities include the following:

1. Wastes associated with well installation, development, test pumping and purging;
2. Aquifer testing wastes;
3. Dewatering wastes from subterranean seepage;
4. Groundwater dewatering wastes at construction sites; and
5. Groundwater remediation.

---

<sup>3</sup> For Dischargers covered under only Order No. R8-2004-0021, the Notice of Intent must be filed only if the expected duration of the discharge is more than one year from the date of initiation of the discharge.

<sup>4</sup> All further statutory references are to title 40 of the Code of Federal Regulations unless otherwise indicated.

- C. TMDLs.** In June 2007, the U.S. EPA approved the State's 2004-2006 303(d) list of impaired water bodies. This list included Reaches 1 and 2 of San Diego Creek and Upper and Lower Newport Bay. One or more of these water bodies were determined to be impaired by one or more pollutants, including the following: fecal coliform, nutrients, selenium, metals and organochlorine compounds (DDT, toxaphene, chlordane and PCBs). Nutrient, fecal coliform, sediment, and toxic pollutants (including selenium and organochlorine compounds) TMDLs have been established for the San Diego Creek/Newport Bay watershed. This Order implements relevant TMDL requirements (see Attachment F).
- D. Regulatory Approach.** For those new Dischargers subject to this Order who choose not to participate in the Nitrogen and Selenium Management Program (NSMP) Working Group, this Order adopts the following regulatory approach. First, these Dischargers are required to evaluate the selenium concentration in their potential discharges to determine whether immediate compliance with the numeric effluent limitations specified in this Order is feasible and either: (1) discharge in accordance with the numeric effluent limitations (if feasible) and with the remaining terms and conditions of this Order; or (2) if compliance with the numeric selenium limitations is infeasible, then the Discharger must demonstrate that it is not reasonably possible to reduce or eliminate the discharge to surface waters, and if it is demonstrated that it is not reasonably feasible to reduce or eliminate the discharge, then the Discharger must either (a) not commence the discharge, or (b) the Discharger must identify and participate in a program that assures that selenium discharges in excess of those allowed pursuant to the effluent limitations will be offset on at least a one-to-one basis, or as determined by the Regional Water Board's Executive Officer. For those Dischargers subject to this Order who choose to participate in the NSMP Working Group, this Order adopts the regulatory approach employed in Order No. R8-2004-0021 (see Attachment F).
- E. Legal Authorities.** This Order is issued pursuant to Section 402 of the federal Clean Water Act (CWA) and implementing regulations adopted by the U.S. Environmental Protection Agency (USEPA) and Chapter 5.5, Division 7 of the California Water Code (CWC) (commencing with section 13370). It shall serve as a NPDES permit for point source discharges from groundwater dewatering and cleanup facilities to surface waters. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to Article 4, Chapter 4, Division 7 of the Water Code (commencing with Section 13260).
- F. Background and Rationale for Requirements.** The Regional Water Board developed the requirements in this Order based on information obtained through issuance and enforcement of general permits Orders No. R8-2007-0008 and R8-2004-0021 for groundwater cleanup and dewatering discharges, through monitoring and reporting programs, and other available information. The Fact Sheet (Attachment F), which contains background information and rationale for Order requirements, is hereby incorporated into this Order and, thus constitutes part of the Findings for this Order. Attachments A through E and G through I are also incorporated into this Order.

- G. State law.** The provisions/requirements in subsections VI.B. of this Order are included to implement State law only. These provisions are not required or authorized under the federal CWA; consequently, violations of these provisions are not subject to the enforcement remedies that are available for NPDES violations.
- H. California Environmental Quality Act (CEQA).** Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of CEQA, Public Resources Code section 21000 et seq. (*County of Los Angeles v. California State Water Resources Control Board* (2006) 143 Cal.App.4th 985, mod. (Nov. 6, 2006, B184034) 50 Cal.Rptr.3d 619, 632-636.)
- I. Technology-based Effluent Limitations.** Section 301(b) of the CWA and implementing USEPA permit regulations at section 122.44, require that permits include conditions meeting applicable technology-based requirements at a minimum, and any more stringent effluent limitations necessary to meet applicable water quality standards. The discharges authorized by this Order must meet minimum federal technology-based requirements and/or Best Professional Judgment (BPJ) in accordance with Part 125, section 125.3. A detailed discussion of the technology-based effluent limitations development is included in the Fact Sheet.
- J. Water Quality-Based Effluent Limitations.** Section 301(b) of the CWA and section 122.44(d) of 40 CFR require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards. This Order contains requirements that are more stringent than technology-based requirements and are necessary to meet applicable water quality standards. The rationale for these requirements is discussed in the Fact Sheet.

Section 122.44(d)(1)(i) mandates that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, water quality-based effluent limitations (WQBELs) must be established using: (1) USEPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in section 122.44(d)(1)(vi).

**K. Water Quality Control Plans.** The Regional Water Board adopted a revised Water Quality Control Plan for the Santa Ana Region (hereinafter Basin Plan) that became effective on January 24, 1995. The Basin Plan designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters in the Santa Ana Region addressed through the plan. More recently, the Basin Plan was amended significantly to incorporate revised boundaries for groundwater subbasins, now termed "management zones", new nitrate-nitrogen and TDS objectives for the new management zones, and new nitrogen and TDS management strategies applicable to both surface and ground waters. This Basin Plan Amendment was adopted by the Regional Water Board on January 22, 2004. The State Water Resources Control Board (State Water Board) and Office of Administrative Law (OAL) approved the Amendment on September 30, 2004 and December 23, 2004, respectively. EPA approved the surface water standards components of the N/TDS Amendment on June 20, 2007.

The existing and potential beneficial uses of Newport Bay, San Diego Creek and tributaries include:

1. Navigation,
2. Water Contact Recreation,
3. Non-contact Water Recreation,
4. Commercial and Sportfishing,
5. Preservation of Biological Habitats of Special Significance,
6. Wildlife Habitat,
7. Rare, Threatened or Endangered Species,
8. Spawning, Reproduction, and Development,
9. Marine Habitat,
10. Shellfish Harvesting,
11. Estuarine Habitat,
12. Warm Freshwater Habitat, and
13. Groundwater Recharge (intermittent beneficial use).

Newport Bay and San Diego Creek are excepted from MUN beneficial use. Surface waters within the San Diego Creek Watershed overlie and recharge the only groundwater management zone in the watershed, the Irvine Groundwater Management Zone. The existing and potential beneficial uses of Irvine Groundwater Management Zone include:

1. Municipal and Domestic Supply,
2. Agricultural Supply,
3. Industrial Service Supply, and
4. Industrial Process Supply

Requirements of this Order implement the Basin Plan.

- L. National Toxics Rule (NTR) and California Toxics Rule (CTR).** USEPA adopted the NTR on December 22, 1992, and later amended it on May 4, 1995 and November 9, 1999. About forty criteria in the NTR applied in California. On May 18, 2000, USEPA adopted the CTR. The CTR promulgated new, numeric toxics criteria for California and, in addition, incorporated the previously adopted NTR criteria that were applicable in the state. The CTR was amended on February 13, 2001. These rules contain water quality criteria for priority pollutants.
- M. State Implementation Policy.** On March 2, 2000, the State Water Board adopted the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (State Implementation Policy or SIP). The SIP became effective on April 28, 2000 with respect to the priority pollutant criteria promulgated for California by the USEPA through the NTR and to the priority pollutant objectives established by the Regional Water Board in the Basin Plan. The SIP became effective on May 18, 2000 with respect to the priority pollutant criteria promulgated by the USEPA through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005 that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for toxicity control. Requirements of this Order implement the SIP.
- N. Compliance Schedules and Interim Requirements.** Section 2.1 of the SIP provides that, based on a Discharger's request and demonstration that it is infeasible for an existing Discharger to achieve immediate compliance with an effluent limitation derived from a CTR criterion, compliance schedules may be allowed in an NPDES permit. Unless an exception has been granted under Section 5.3 of the SIP, a compliance schedule may not exceed 5 years from the date that the permit is issued or reissued, nor may it extend beyond 10 years from the effective date of the SIP (or May 18, 2010) to establish and comply with CTR criterion-based effluent limitations. Where a compliance schedule for a final effluent limitation exceeds 1 year, the Order must include interim numeric limitations for that constituent or parameter. Where allowed by the Basin Plan, compliance schedules and interim effluent limitations or discharge specifications may also be granted to allow time to implement a new, revised or newly interpreted water quality objective. This Order includes compliance schedules and interim effluent limitations and/or discharge specifications. A detailed discussion of the basis for the compliance schedule(s) and interim effluent limitation(s) and/or discharge specifications is included in the Fact Sheet.
- O. Interim Performance-Based Limits:** Implementation by Dischargers not participating in the NSMP Working Group of an acceptable selenium offset program; including implementation of volume-reduction/other BMPs coupled with interim steps necessary to implement the offset, constitutes interim performance-based limits. For Dischargers participating in the NSMP Working Group, participation in the Working Group and timely and effective implementation of the Regional Board-approved Work Plans constitute interim, performance-based effluent limitations.

**P. Alaska Rule.** On March 30, 2000, USEPA revised its regulation that specifies when new and revised State and Tribal water quality standards (WQS) become effective for CWA purposes (40 C.F.R. section 131.21; 65 Fed. Reg. 24641 (April 27, 2000)). Under the revised regulation (also known as the Alaska rule), new and revised standards submitted to USEPA after May 30, 2000, must be approved by USEPA before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA by May 30, 2000, may be used for CWA purposes, whether or not approved by USEPA.

**Q. Stringency of Requirements for Individual Pollutants.** This Order contains both technology-based and water quality based effluent limitations for individual pollutants. This Order's technology-based pollutant restrictions implement the minimum, applicable federal technology-based requirements. In addition, this Order contains effluent limitations more stringent than the minimum, federal technology-based requirements that are necessary to meet water quality standards. These limitations are not more stringent than required by the CWA.

Water quality-based effluent limitations have been scientifically derived to implement water quality objectives that protect beneficial uses. Both the beneficial uses and the water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. To the extent that toxic pollutant water quality-based effluent limitations were derived from the CTR, the CTR is the applicable standard pursuant to section 131.38. The scientific procedures for calculating the individual water quality-based effluent limitations for priority pollutants are based on the CTR and SIP, which was approved by USEPA on May 18, 2000. Apart from certain surface water standards changes resulting from the N/TDS Basin Plan amendment, all beneficial uses and water quality objectives contained in the Basin Plan were approved under state law and submitted to and approved by USEPA prior to May 30, 2000. Any water quality objectives and beneficial uses submitted to USEPA prior to May 30, 2000, but not approved by USEPA before that date, are nonetheless "applicable water quality standards for purposes of the CWA" pursuant to section 131.21(c)(1). Collectively, this Order's restrictions on individual pollutants are no more stringent than required to implement the technology-based requirements of the CWA and the applicable water quality standards for purposes of the CWA.

**R. Antidegradation Policy.** Section 131.12 requires that State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy, where the federal policy applies under federal law. Resolution 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The Regional Water Board's Basin Plan implements, and incorporates by reference, both the State and federal antidegradation policies. As discussed in detail in the Fact Sheet (Attachment F) the permitted discharge is consistent with the antidegradation provisions of section 131.12 and State Water Board Resolution 68-16.

- S. Anti-Backsliding Requirements.** Sections 402(o)(2) and 303(d)(4) of the CWA and federal regulations at title 40, Code of Federal Regulations section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. This is a new general permit that will combine and consolidate effluent limitations in existing general permits Order No. R8-2007-0008 and Order No. R8-2004-0021.
- T. Monitoring and Reporting.** Section 122.48 requires that all NPDES permits specify requirements for recording and reporting monitoring results. Water Code sections 13267 and 13383 authorize the Regional Water Board to require technical and monitoring reports. The Monitoring and Reporting Program establishes monitoring and reporting requirements to implement federal and State requirements. This Monitoring and Reporting Program is provided in Attachment E.
- U. Standard and Special Provisions.** Standard Provisions, which apply to all NPDES permits in accordance with section 122.41, and additional conditions applicable to specified categories of permits in accordance with section 122.42, are provided in Attachment D. The Discharger must comply with all standard provisions and with those additional conditions that are applicable under section 122.42. The Regional Water Board has also included in this Order special provisions applicable to the Discharger. A rationale for the special provisions contained in this Order is provided in the attached Fact Sheet.
- V. Notification of Interested Parties.** The Regional Water Board has notified the Discharger and interested agencies and persons of its intent to prescribe Waste Discharge Requirements for the discharge and has provided them with an opportunity to submit their written comments and recommendations. Details of notification are provided in the Fact Sheet (Attachment F) of this Order.
- W. Consideration of Public Comment.** The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the discharge. Details of the Public Hearing are provided in the Fact Sheet (Attachment F) of this Order.

#### **IV. DISCHARGE PROHIBITIONS**

- A. The discharge of oil, trash, industrial waste sludge, or other solids directly to the surface waters in this region or in any manner that will ultimately affect surface waters in this region is prohibited.
- B. The discharge of any substances in concentrations toxic to animal or plant life is prohibited.
- C. The discharge of wastes to property not owned or controlled by the Discharger is prohibited.

- D. Odors, vectors, and other nuisances of waste origin are prohibited beyond the limits of each Discharger's facility.
- E. The addition of chemicals to the extracted groundwater, exclusive of chlorine to control biofouling (H<sub>2</sub>S) in treatment systems, is prohibited except when approved by the Executive Officer.
- F. The direct discharges of waste to Areas of Special Biological Significance, including Newport Beach Marine Life Refuge and Irvine Coast Marine Life Refuge are prohibited.

## V. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS

### A. Effluent Limitations

#### 1. Final Effluent Limitations

- a. The Discharger shall maintain compliance with the following effluent limitations at approved compliance point monitoring locations:

**Table 1. Effluent Limitations Applicable to Discharge to San Diego Creek & Tributaries**

| Constituent   | Maximum Daily Concentration Limit (µg/L)                      | Average Monthly Concentration Limit (µg/L) |
|---|---|--|
| Arsenic   | 246   | 123  |
| Total Recoverable Chromium VI   | 16  | 8.0  |
| Total Recoverable Mercury   | 0.102   | 0.051                                      |
| Total Recoverable Selenium  | 8.2 (see paragraph V.A.1.b. & c., below)                      | 4.1 (see paragraph V.A.1.b. & c., below)   |
| Metal Constituents not listed in this Table that are hardness dependent | (see Discharge Specifications V.A.2., below and Attachment B) |  |
| Other Constituents Listed in Table 3, below                             | See Table 3, below  | See Table 3, below                         |

**Table 2. Effluent Limitations Applicable to Upper and Lower Newport Bay**

| Constituent | Maximum Daily Concentration Limit (µg/L) | Average Monthly Concentration Limit (µg/L) |
|-------------|--|--|
| Arsenic     | 59                                       | 29   |

**Table 2. Effluent Limitations Applicable to Upper and Lower Newport Bay**

| Constituent                                 | Maximum Daily Concentration Limit (µg/L)   | Average Monthly Concentration Limit (µg/L)   |
|---|--|--|
| Total Recoverable Cadmium                   | 15   | 7.6  |
| Total Recoverable Chromium VI               | 82   | 41   |
| Total Recoverable Copper                    | 4.8  | 2.4  |
| Total Recoverable Lead                      | 13   | 6.6  |
| Total Recoverable Mercury                   | 0.102                                      | 0.051  |
| Total Recoverable Nickel                    | 13   | 6.7  |
| Total Recoverable Selenium                  | 116 (see paragraph V.A.1.b. c. & d, below) | 58 (see paragraph V.A.1.b., c. and d, below) |
| Total Recoverable Silver                    | 1.9  | 0.95   |
| Total Recoverable Zinc                      | 90   | 45   |
| Other Constituents Listed in Table 3, below | See Table 3, below                         | See Table 3, below                           |

**Table 3. Effluent Limitations Applicable to All Receiving Waters**

| Constituent                               | Maximum Daily Concentration Limit (µg/L) | Average Monthly Concentration Limit (µg/L) |
|---|--|--|
| 1,1,1-Trichloroethane (TCA)               | 10                                       | 5  |
| 1,1-Dichloroethane                        | 10                                       | 5  |
| 1,1-Dichloroethylene                      | 12                                       | 6  |
| 1,2-Dichloroethane                        | 1.0                                      | 0.5  |
| 1,2-Dichloroethylene (sum of cis & trans) | 20.1                                     | 10   |
| 1,2- Dichloroethylene (cis)               | 12                                       | 6  |
| 1,2-Dichloroethylene (trans)              | 20                                       | 10   |
| 1,4-Dioxane                               | 6  | 3  |
| Benzene                                   | 2  | 1  |
| Carbon Tetrachloride                      | 1  | 0.5  |
| Chloroform                                | 10                                       | 5  |

**Table 3. Effluent Limitations Applicable to All Receiving Waters**

| <b>Constituent</b>                   | <b>Maximum Daily Concentration Limit (µg/L)</b> | <b>Average Monthly Concentration Limit (µg/L)</b> |
|--------------------------------------|---|---|
| Dichlorobromomethane                 | 10  | 5   |
| Ethylbenzene                         | 20  | 10  |
| Methyl Ethyl Ketone                  | 241   | 120   |
| Methyl Isobutyl Ketone               | 241   | 120   |
| Methyl Tertiary Butyl Ether (MTBE)   | 26  | 13  |
| Naphthalene                          | 20  | 10  |
| Perchlorate                          | 8   | 4   |
| Tert Butyl Alcohol (TBA)             | 34  | 12  |
| Tetrachloroethylene (PCE)            | 10  | 5   |
| Toluene                              | 20  | 10  |
| Trichloroethylene (TCE)              | 10  | 5   |
| Vinyl Chloride                       | 1   | 0.5   |
| Xylene (Total)                       | 20  | 10  |
| 1,2,3-Trichloropropane (1,2,3-TCP)   | 1.01  | 0.5   |
| <b>Constituent</b>                   | <b>Maximum Daily Concentration Limit</b>        |   |
| Total Dissolved Solids (TDS)         | See Section V.A.3., below                       |   |
| Total Inorganic Nitrogen (TIN)       | See Section V.A.4., below                       |   |
| Total Residual Chlorine <sup>5</sup> | 0.1 mg/L  |   |
| Suspended Solids                     | 75 mg/L   |   |
| Sulfides                             | 0.4 mg/L  |   |
| Total Petroleum Hydrocarbons         | 100 µg/L (ppb)                                  |   |
| Oil and Grease                       | 15 mg/L   |   |

- b. Compliance with the Total Recoverable Selenium limit specified in V.A.1.a., above (see also Provisions VII.C.6.b.), shall be achieved as soon as possible but no later than December 20, 2009, provided that:

- (1) The Discharger becomes and remains a member of the Nitrogen and Selenium Management Program Working Group (NSMP Working Group, or Working Group), including the Discharger's satisfaction of financial and participatory commitments established by the Working Group; and
  - (2) The Discharger implements one or more reasonable BMPs for volume-reduction and/or treatment identified as part of the Work Plan developed and implemented by the Working Group;
  - (3) The Discharger, as a member of the Working Group, is implementing the Work Plan in accordance with the schedule approved by the Regional Water Board (see Provision VII.C.6.c. - Other Special Provisions), or acceptable alternative dates approved by the Executive Officer; and
  - (4) **Interim Limits:** With regard to the selenium contained in the discharges subject to this Order by Working Group participants, the requirements contained in this Discharge Specification constitute interim performance-based effluent limitations and compliance schedules for these discharges, and also satisfy requirements contained in Receiving Water Limitations VI.A.1. and VI.A.2.i., Discharge Prohibitions IV.B., and Provision VII.A.2. The provisions of this Discharge Specification also constitute interim performance-based effluent limitations and compliance schedules and satisfy the requirements of Receiving Water Limitations VI.A.1. and VI.A.2.i., Discharge Prohibitions IV.B., and Provision VII.A.2. for contractors and licensees of participating Working Group members, provided that such contractors and licensees are adhering to BMP and monitoring provisions as described in this Discharge Specification.
- c. If the conditions specified in V.A.1.b., above are not satisfied, then compliance with the Total Recoverable Selenium limit in V.A.1.a., above shall be achieved immediately, unless the Discharger implements a program or programs approved by the Executive Officer to offset discharges in excess of the effluent limits. (See Provision VII.C.6.b.)
- d. If the Discharger does not become or does not remain a member of the NSMP Working Group and all other conditions specified in Section V.A.1.a., above, are not satisfied, and if the Discharger demonstrates that immediate compliance with the Total Recoverable Selenium limits in V.A.1.a. is infeasible, the Discharger shall either:
- (1) Cease or not commence discharges until compliance with the Total Recoverable Selenium limits in V.A.1.a. can be achieved; or,
  - (2) Proceed to implement a selenium offset program approved by the Executive Officer as follows:

- i. In no case shall the schedule for completion of the offset exceed December 20, 2009. Compliance with the Total Recoverable Selenium limit specified in V.A.1.a., above, shall be achieved no later than December 20, 2009. The offset program shall address offset of selenium discharges that take place while the offset plan is developed and approved.
  - ii. Collect data on flow and selenium quality to assure that ongoing selenium discharges are properly accounted for and offset pending development, approval and implementation of the offset plan; and
  - iii. Implement the offset plan/schedule upon approval by the Executive Officer.
  - iv. The offset program shall be revised if and as necessary to reflect compliance with the selenium limits but shall continue to assure that selenium discharges that took place in excess of the selenium limits are appropriately offset. Any approved amended offset program shall be implemented upon approval by the Executive Officer. (see also Provisions VII.C.6.a.)
2. For discharges to freshwater<sup>6</sup> bodies, the maximum daily and average monthly effluent limitations for the metal constituent shall not exceed the concentrations tabulated in Attachment "B" of this Order, corresponding to the effluent or receiving water hardness<sup>7</sup>, as approved by the Executive Officer.
3. The TDS concentration of the discharge shall not exceed the TDS limitations for the affected receiving water shown in Table 4., below:

**Table 4. TDS Effluent Limits**

| Receiving Water  | TDS, mg/L |
|--|-----------|
| Reach 1, San Diego Creek, below Jeffrey Rd               | 1500      |
| Reach 2, San Diego Creek, above Jeffrey Rd to Headwaters | 720       |

---

<sup>6</sup> Waters in which the salinity is equal to or less than 1 part per thousand 95% or more of the time.

<sup>7</sup> For direct discharges into receiving water, this hardness value is the 5th percentile of effluent hardness measurements or the average ambient receiving water hardness measurements, whichever is more restrictive. Where discharges are into storm drains with wastewater/nuisance flows, the effluent 5th percentile hardness value shall be used.

4. When the quality of extracted/dewatered groundwater discharges exceeds 1 mg/L Total Inorganic Nitrogen (TIN), the ambient total nitrogen (TN) mass in the discharges shall be reduced by 50%. That is, the average monthly mass of total nitrogen (TN) discharges shall not be greater than 50% of the mass of TN in the extracted groundwater. This limit applies unless the Discharger develops and implements, an offset program approved by the Executive Officer (See Provisions VII.C.6.). The total nitrogen monthly mass emission rate for the extracted groundwater and discharged wastewater shall be determined by using the following formula:

$$\text{Mass (lbs/month) of extracted or discharged wastewater} = 8.34 \times Q \times C$$

Where:

Q= total flow of extracted or discharged within the month in million gallons

C= the sum of all measurements for the parameter within the month (in milligrams per liter) for the extracted or discharged wastewater divided by the total number of samples.

5. The pH of the discharge shall be within 6.5 and 8.5 pH units (see also Receiving Water Limitations VI.A.2.h.).
6. There shall be no visible oil and grease in the discharge.

**B. Land Discharge Specifications – Not Applicable**

**C. Reclamation Specifications – Not Applicable**

**VI. RECEIVING WATER LIMITATIONS**

**A. Surface Water Limitations**

1. The discharge of wastes shall not cause a violation of any applicable water quality standards for receiving waters adopted by the Regional Water Board or the State Board, as required by the Federal CWA and regulations adopted thereunder.
2. The discharge shall not cause any of the following:
  - a. Coloration of the receiving waters that causes a nuisance or adversely affects beneficial uses. The natural color of fish, shellfish or other inland, bay and estuarine water resources used for human consumption shall not be impaired.
  - b. Deposition of oil, grease, wax or other materials in the receiving waters in concentrations that result in a visible film or in coating objects in the water, or which cause a nuisance or adversely affect beneficial uses.

- c. An increase in the amounts of suspended or settleable solids in the receiving waters that will cause a nuisance or adversely affect beneficial uses as a result of controllable water quality factors.
  - d. Taste or odor producing substances in the receiving waters at concentrations that cause a nuisance or adversely affect beneficial uses.
  - e. The presence of radioactive materials in the receiving waters in concentrations that is deleterious to human, plant or animal life.
  - f. The depletion of the dissolved oxygen concentration below 5.0 mg/l.
  - g. The temperature of the receiving waters to be raised above 90°F (32°C) during the period of June through October, or above 78°F (26°C) during the rest of the year.
  - h. Change the ambient pH levels more than 0.5 pH units.
  - i. The concentration of pollutants in the water column, sediments, or biota to adversely affect the beneficial uses of the receiving water. The discharge shall not result in the degradation of inland surface water communities and populations, including vertebrate, invertebrate, and plant species.
3. Pollutants not specifically mentioned and limited in this Order shall not be discharged at levels that will bioaccumulate in aquatic resources to levels, which are harmful to human health.
4. The discharge shall not result in acute toxicity in ambient receiving waters. The effluent shall be deemed to cause acute toxicity when the toxicity test of 100% effluent as required in Attachment E, results in failure of the test as determined using the pass or fail<sup>8</sup> test protocol specified in Methods for Measuring the Acute Toxicity of Effluents to Freshwater and Marine Organisms (EPA/821-R-02-012, October 2002). The Discharger shall immediately stop the discharge whenever the discharge fails the toxicity test(s). Prior to resuming the discharge, the Discharger shall identify and correct the source of the toxicity to the satisfaction of the Executive Officer.

## **B. Groundwater Limitations**

1. The discharge shall not cause the underlying groundwater to be degraded, to exceed water quality objectives, unreasonably affect beneficial uses, or cause a condition of pollution or nuisance.

---

<sup>8</sup> Control survival must be 90% or greater for an acceptable test. The test "passes" if survival in the control and effluent concentration equals or exceeds 90%. The test "fails" if survival in the effluent is less than 90%, and is significantly different from control survival (which must be 90% or greater), as determined by hypothesis testing.

2. The discharge, in combination with other sources, shall not cause underlying groundwater to contain waste constituents in concentrations greater than background water quality.
3. Groundwater discharges exceeding the Irvine groundwater management zone water quality objectives for TDS (910 mg/L) and TIN (7.9 mg/L) may be returned to the same management zone from which it was extracted without reduction of the TDS or TIN concentrations so long as the concentrations of those constituents are no greater than when the groundwater was first extracted. Incidental increases in the TDS and TIN concentrations (such as may occur during air stripping) of treated effluent will not be considered increases for the purposes of determining compliance with this discharge specification.

## **VII. PROVISIONS**

### **A. Standard Provisions**

1. The Discharger shall comply with all Standard Provisions included in Attachment D of this Order.
2. Neither the treatment nor the discharge of waste shall create, or threaten to create, a nuisance or pollution as defined by Section 13050 of the California Water Code.
3. This Order expires on November 1, 2012. However, coverage under the permit shall continue in force and effect until a new Order is issued for those Dischargers who are authorized to discharge under the terms and conditions of the Order and who submit a renewal application by April 1, 2012. For those Dischargers who do not submit a renewal application by April 1, 2012, discharges of wastewater under this Order shall be terminated by November 1, 2012, unless the Executive Officer of the Regional Water Board has given prior approval for a delayed submission of renewal application. If the Executive Officer has given prior approval for a delayed submission of a renewal application, then the discharge can continue after November 1, 2012.
4. The Executive Officer shall determine whether the proposed discharge is eligible for coverage under this general permit, after which, the Executive Officer may;
  - a. Authorize the proposed discharge by transmitting a "Discharge Authorization Letter" to the discharge proponent (now an "authorized Discharger") authorizing the initiation of the discharge under the conditions of this Order and any other conditions consistent with this Order which are necessary to protect the beneficial uses of the receiving waters; or,
  - b. Require the discharge proponent to obtain an individual NPDES permit prior to any discharge to surface waters within the Santa Ana Region.

5. The discharge authorization letter from the Executive Officer shall specify any conditions necessary to protect the beneficial uses of the receiving waters and shall specify the Self-Monitoring Program for the proposed discharge in accordance with this Order. The discharge authorization letter may be terminated or revised by the Executive Officer at any time. The discharge authorization letter, which identifies the discharge location(s), is incorporated by reference into this Order.
6. The Discharger shall implement any required plan/programs in this Order upon approval by the Executive Officer and shall update the plans/programs as appropriate during the life of this general permit. The updated plans shall be approved by the Executive Officer.
7. The Discharger shall comply with all requirements of this Order and the terms, conditions and limitations of the discharge authorization letter.
8. The discharge shall be limited to groundwater and added treatment chemicals approved by the Executive Officer.
9. The Discharger shall give advance notice to the Regional Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with these waste discharge requirements.
10. The Discharger shall take all reasonable steps to minimize or prevent any discharge that has a reasonable likelihood of adversely affecting human health or the environment.
11. The Discharger shall take all reasonable steps to minimize any adverse impact to receiving waters resulting from noncompliance with any effluent limitations specified in this Order, including such accelerated or additional monitoring as necessary to determine the nature and impact of the noncomplying discharge.
12. The Discharger shall, at all times, properly operate and maintain<sup>9</sup> all facilities and systems of treatment (and related appurtenances) and control which are installed or used by the Discharger to achieve compliance with this Order and the conditions of the authorization letter(s) from the Executive Officer. Proper operation and maintenance shall include the following:
  - a. Effective performance, adequate funding, adequate operator staffing and training and adequate laboratory and process controls and appropriate quality assurance procedures.
  - b. Regular maintenance and inspection of all systems.
  - c. Maintenance of records of the inspection results that shall be made available to the Regional Water Board whenever required and demanded.

---

<sup>9</sup> *Proper operation and maintenance includes effective performance, adequate funding, adequate operator staffing and training, and adequate laboratory and process controls and appropriate quality assurance procedures.*

13. The Discharger shall comply with effluent standards or prohibitions established under section 307(a) of the CWA for toxic pollutants within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement.
14. This Order does not convey any property rights of any sort, or any exclusive privilege.
15. This Order is not transferable to any person except after notice to and approval by the Regional Water Board.
16. The requirements prescribed herein do not authorize the commission of any act causing injury to the property of another, nor protect the Discharger from his liabilities under federal, state, or local laws, nor guarantee the Discharger a capacity right in the receiving waters.
17. The provisions of this Order are severable, and if any provision of this Order, or the application of any provisions of this Order to any circumstance, is held invalid, the application of such provision to other circumstances, and the remainder of this Order shall not be affected thereby.
18. Any violation of this Order constitutes a violation of the CWA, its regulations, and the California Water Code, and is grounds for enforcement action and/or termination of the authorization to discharge.
19. Failure to comply with provisions or requirements of this Order, or violation of other applicable laws or regulations governing discharges from this facility, may subject the Discharger to administrative or civil liabilities, criminal penalties, and/or other enforcement remedies to ensure compliance. Additionally, certain violations may subject the Discharger to civil or criminal enforcement from appropriate local, state, or federal law enforcement entities.
20. In the event the Discharger does not comply or will be unable to comply for any reason, with any prohibition, discharge limitations (e.g., maximum daily effluent limitation), or receiving water limitation of this Order, the Discharger shall notify the Regional Water Board by telephone (951) 782-4130 within 24 hours of having knowledge of such noncompliance, and shall confirm this notification in writing within five days, unless the Regional Water Board waives confirmation. The written notification shall state the nature, time, duration, and cause of noncompliance, and shall describe the measures being taken to remedy the current noncompliance and, prevent recurrence including, where applicable, a schedule of implementation. Other noncompliance requires written notification as above at the time of the normal monitoring report.
21. All treatment facility startup and operation instruction manuals shall be maintained and available to operating personnel at the site where groundwater remediation is being conducted.

## **B. Monitoring and Reporting Program (MRP) Requirements**

The Discharger shall comply with the monitoring and reporting program issued by the Executive Officer with the authorization letter. Revision of this monitoring and reporting program by the Executive Officer may be necessary to confirm that the Discharger is in compliance with the requirements and provisions contained in this Order. Revisions may be made by the Executive Officer at any time during the term of this Order, and may include a reduction or an increase in the number of constituents to be monitored, the frequency of monitoring or the number and size of samples collected. Reduction in the number of constituents being monitored and/or frequency of monitoring shall be considered only if the following conditions are satisfied:

1. Only Dischargers without any criminal convictions under any environmental statute and NPDES civil judicial and administrative enforcement actions are eligible.
2. Only Dischargers covered under the previous Order No. R8-2007-0008 and/or Order No. R8-2004-0021 or under an existing individual permit for the last consecutive two years who have had no effluent violations of monitored constituents during the last two years are eligible.
3. Constituents with effluent limitations shall be monitored at least once per year.
4. The following performance conditions shall be met:
  - a. For a specific constituent, reduction of weekly monitoring to bi-monthly (every two weeks) monitoring can be considered with approval by the Executive Officer when the effluent monitoring data for the last 3 months show compliance with effluent limitations.
  - b. For a specific constituent, reduction of bi-monthly (every two weeks) monitoring to monthly monitoring can be considered with approval by the Executive Officer when the effluent monitoring data for the last 6 months show compliance with effluent limitations.
  - c. For specific constituent, reduction of monthly monitoring to quarterly monitoring can be considered with approval by the Executive Officer when the effluent monitoring data for the last 12 months show compliance with effluent limitations.
5. Should any of the weekly, bi-monthly, monthly, quarterly or annual monitoring for a specific constituent show effluent concentrations above the effluent limit, the frequency of monitoring for that constituent shall be increased to weekly or daily as directed by the Executive Officer.
6. Should groundwater treatment and discharge stop for more than one month, the frequency of monitoring shall be increased to weekly as directed by the Executive Officer.

## **C. Special Provisions**

### **1. Reopener Provisions**

- a. This Order may be reopened for modification, or revocation and reissuance, as a result of the detection of a reportable priority pollutant (including organochlorine compounds) generated by special conditions included in this Order. These special conditions may be, but are not limited to whole effluent toxicity, monitoring requirements on internal waste stream(s), and monitoring for surrogate parameters. Additional requirements may be included in this Order as a result of the special condition monitoring data.
- b. If more stringent applicable water quality standards are promulgated or approved pursuant to Section 303 of the Federal CWA, or amendments thereto, the Board will revise and modify this Order in accordance with such standards.
- c. This Order may be reopened to address any changes in State or federal plans, policies or regulations that would affect the quality requirements for the discharges.
- d. Any permit noncompliance constitutes a violation of the CWA and the California Water Code and is grounds for enforcement action; for permit or authorization letter termination, revocation and reissuance, or modification; the issuance of an individual permit; or for denial of a renewal application.
- e. This Order may be modified by the Regional Water Board prior to the expiration date to include effluent or receiving water limitations for toxic constituents determined to be present in significant amounts in the discharge through the comprehensive monitoring program included as part of this Order.
- f. This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by a Discharger for modification, revocation and reissuance, or termination of this Order or a notification of planned changes or anticipated noncompliance does not stay any permit condition.
- g. This Order may be reopened to include applicable technology-based effluent limitations, as appropriate when and if the Working Group has identified the selenium treatment technology (-ies) appropriate for these types of discharge.

## **2. Special Studies, Technical Reports and Additional Monitoring Requirements – Selenium**

- a. When immediate compliance with the Total Recoverable Selenium limits specified in Section V.A.1.a. is infeasible, the Discharger shall submit quarterly progress reports to describe the progress of studies and/or actions undertaken to reduce selenium in the effluent, and to achieve compliance with the requirements of this Order. This includes actions taken pursuant to an approved BMP and Pollution Prevention Plan (See Section VII.C.3. "Best Management Practices and Pollution Prevention", below), and actions taken pursuant to any approved selenium offset program. The Discharger shall submit this report together with the Quarterly Report required in Attachment E. Provided that the Discharger becomes and remains a member of the Nitrogen and Selenium Management Program (NSMP) Working Group, which is implementing a Work Plan that includes investigations of nitrogen and selenium sources and controls in the San Diego Creek Watershed, reports prepared and submitted pursuant to the NSMP shall constitute compliance with this requirement.

## **3. Best Management Practices and Pollution Prevention**

### **a. Pollutant Minimization Program**

The Discharger shall develop and conduct a Pollutant Minimization Program (PMP) as further described below when there is evidence (e.g., sample results reported as Detected, but Not Quantified (DNQ) when the effluent limitation is less than the Method Detection Limit (MDL), sample results from analytical methods more sensitive than those methods required by this Order, presence of whole effluent toxicity, health advisories for fish consumption, results of benthic or aquatic organism tissue sampling) that a priority pollutant is present in the effluent above an effluent limitation and either:

- (1) A sample result is reported as DNQ and the effluent limitation is less than the RL; or
- (2) A sample result is reported as Not Detected (ND) and the effluent limitation is less than the MDL, using reporting protocols described in MRP Section X.

The PMP shall include, but not be limited to, the following actions and submittals acceptable to the Regional Water Board:

- (1) An annual review and semi-annual monitoring of potential sources of the reportable priority pollutant(s), which may include fish tissue monitoring and other bio-uptake sampling;
- (2) Quarterly monitoring for the reportable priority pollutant(s) in the influent to the wastewater treatment system;

- (3) Submittal of a control strategy designed to proceed toward the goal of maintaining concentrations of the reportable priority pollutant(s) in the effluent at or below the effluent limitation;
- (4) Implementation of appropriate cost-effective control measures for the reportable priority pollutant(s), consistent with the control strategy; and
- (5) An annual status report that shall be sent to the Regional Water Board including:
  - i. All PMP monitoring results for the previous year;
  - ii. A list of potential sources of the reportable priority pollutant(s);
  - iii. A summary of all actions undertaken pursuant to the control strategy; and
  - iv. A description of actions to be taken in the following year.

b. Selenium/Nitrogen BMP

The Discharger shall implement the approved plan and schedule for identifying, evaluating and implementing selenium and nitrogen control and reduction BMPs, including volume-reduction techniques. (see Section II.C.5., above).

**4. Construction, Operation and Maintenance Specifications**

An Operation and Maintenance (O&M) Manual shall be developed prior to the initiation of the discharge and shall be readily accessible to site operating personnel. The O&M Manual shall include the following:

- a. Detailed description of safe and effective operation and maintenance of treatment processes, process control instrumentation and equipment.
- b. Process and equipment inspection and maintenance schedules.
- c. Describe preventive (fail-safe) and contingency (cleanup) plans for controlling accidental discharges, and for minimizing the effect of such events.
- d. Identification and description of the possible sources of accidental loss, bypass of untreated or partially treated wastes, and polluted drainage including power outage, waste treatment unit outage, and failure of process equipment, tanks and pipes and possible spills.

**5. Special Provisions for Municipal Facilities (POTWs Only) - Not Applicable**

**6. Other Special Provisions**

- a. The Discharger shall implement the nitrogen and/or selenium offset programs upon approval by the Executive Officer.

- b. When and if a practicable selenium treatment technology becomes available, the Discharger shall implement that technology and comply with the final selenium limits in this Order within one year of notification of the need to do so by the Regional Water Board, but in no case later than December 20, 2009.
- c. The Discharger may achieve compliance with the nitrogen limitations of this Order by the development and implementation of an offset program approved by the Regional Water Board's Executive Officer. Any such offset program shall (1) assure the loading of total nitrogen to surface waters as the result of groundwater dewatering and/or cleanup discharges does not exceed that allowed pursuant to the effluent limits in this Order, and (2) shall be completed as soon as possible.
- b. Revisions to an approved selenium offset program that is approved by the Executive Officer but is not fully implemented may be made at the discretion of the Executive Officer in response to revisions to this Order to address revised selenium criteria and/or approved revisions to the selenium TMDL for the San Diego Creek/Newport Bay watershed.
- c. The following constitute elements of the Work Plan administered by the NSMP Working Group, along with target completion dates. In each case, the element of the Work Plan shall be completed by the Working Group as soon as possible but no later than the target completion date shown. The Executive Officer is authorized to revise these target completion dates if demonstrated to be necessary and appropriate:
  - (1) Manage the Work Plan with input from identified technical experts, relevant regulatory agencies and the public (through completion of all elements of the Work Plan);
  - (2) Perform complementary monitoring and assessment of selenium and nutrient sources in the watershed, utilizing, in part, ongoing selenium and nutrient studies performed by others (12/20/2008);
  - (3) Identify and assess selenium treatment technologies, including potential future technologies ;
  - (4) Identify and assess selenium BMPs (including volume-reduction techniques);
  - (5) Facilitate demonstration testing of identified selenium treatment technologies and BMPs;
  - (6) Develop a draft selenium offset, trading or mitigation program based upon the outcome of complementary monitoring, treatment technology and BMP-related Work Plan elements and submit to Executive Officer for review (6/20/2009);
  - (7) Implement the final selenium offset, trading or mitigation program upon the Executive Officer's approval, but no later than 12/20/2009;
  - (8) Evaluate nutrient TMDL, including load/wasteload allocations and reduction targets (focusing particularly on groundwater-related sources, loadings and reductions);

- (9) Develop a draft nutrient offset, trading or mitigation program based upon the outcome of complementary monitoring and TMDL assessment Work Plan elements (6/20/2009);
  - (10) Implement the final nutrient offset, trading or mitigation program upon the Executive Officer's approval but no later than 12/20/2009; and,
  - (11) Develop a recommended selenium site-specific objective for the Newport Bay/San Diego Creek watershed if appropriate based upon outcome of other Work Plan elements (with completion date of 6/17/2009).
- d. All treatment facility startup and operation instruction manuals shall be maintained and available to operating personnel at the site where groundwater cleanup operation is controlled and managed.

## **7. Compliance Schedules - Not Applicable**

## **VIII. COMPLIANCE DETERMINATION**

- A.** Compliance with Discharge Specification A.1. shall be based on the minimum levels specified in Attachment "H" of this Order, unless an alternative minimum level<sup>10</sup> (ML) is approved for the pollutant of concern by the Regional Water Board's Executive Officer. If the Discharger develops a limit of quantitation (LOQ) specific to their matrix, the LOQ shall serve as the ML with the approval of the Executive Officer of the Regional Water Board. If no minimum level is specified for a constituent, the method detection limit (MDL) specified in 40 CFR 136 shall be used. If no MDL is available, the lowest practicable detection limit shall be used with the approval of the Executive Officer. For purposes of reporting and administrative enforcement by the Regional and State Water Boards, the Discharger shall be deemed out of compliance with effluent limitations if the concentration of the priority pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the reporting level (RL).
- B.** Compliance determinations shall be based on available analyses for the time interval associated with the effluent limitation. Where only one sample analysis is available in a specified time interval (e.g., weekly, monthly, quarterly), that sample shall serve to characterize the discharge for the entire interval.
- C. Multiple Sample Data.** When determining compliance with an AMEL, or MDEL for priority pollutants and more than one sample result is available, the Discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of "Detected, but Not Quantified" (DNQ) or "Not Detected" (ND). In those cases, the Discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

---

<sup>10</sup> *Minimum level is the concentration at which the entire analytical system must give a recognizable signal and acceptable point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.*

1. The data set shall be ranked from low to high, ranking the reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.
2. The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

**D. Average Monthly Effluent Limitation (AMEL).** If the average (or when applicable, the median determined by paragraph VIII.4., above, for multiple sample data) of daily discharges over a calendar month exceeds the AMEL for a given parameter, this will represent a single violation, though the Discharger will be considered out of compliance for each day of that month for that parameter (e.g., resulting in 31 days of non-compliance in a 31-day month). If only a single sample is taken during the calendar month and the analytical result for that sample exceeds the AMEL, the Discharger will be considered out of compliance for that calendar month. The Discharger will only be considered out of compliance for days when the discharge occurs. For any one calendar month during which no sample (daily discharge) is taken, no compliance determination can be made for that calendar month.

**E. Maximum Daily Effluent Limitation (MDEL).** If a daily discharge (or when applicable, the median determined by paragraph VIII.4., above, for multiple sample data of a daily discharge) exceeds the MDEL for a given parameter, the Discharger will be considered out of compliance for that parameter for that 1 day only within the reporting period. For any 1 day during which no sample is taken, no compliance determination can be made for that day.

**F. Compliance determination with the Tert Butyl Alcohol (TBA) average monthly limit** shall be based on all samples taken within the month or if the monitoring frequency requirement is once monthly, every two months or quarterly, a minimum of four test results from the most recent sample events.

**G. Effect of Conducting a Pollutant Minimization Program (PMP).** If a sample result for a priority pollutant, or the arithmetic mean or median of multiple sample results is below the RL, and there is evidence that the priority pollutant is present in the effluent above an effluent limitation and the Discharger conducts a PMP for the priority pollutant (as described in Provision VI.C.3), the Discharger shall not be deemed out of compliance.

- H. One Sample Analysis.** Compliance determinations shall be based on available analyses for the time interval associated with the effluent limitation. Where only one sample analysis is available in a specified time interval (e.g., monthly or weekly average), that sample shall serve to characterize the discharge for the entire interval. If quarterly sample results show noncompliance with the average monthly limit and that sample result is used for compliance determinations for each month of the quarter, then three separate violations of the average monthly limit shall be deemed to have occurred.
- I. Single Sample vs. Group of Chemicals.** Compliance with a single effluent limitation which applies to a group of chemicals (e.g., PCBs), based on a single sample shall be determined by considering the concentrations of individual members of the group to be zero if the analytical response for the individual chemical falls below the method detection limit (MDL) for that chemical.
- J. Priority Pollutants.** For priority pollutants, the Discharger shall be deemed out of compliance with an effluent limitation if the concentration of the priority pollutant in the monitoring sample is greater than the effluent limitation.

Compliance determination shall be based on the reporting level (ML)<sup>11</sup> specified in Attachment "H" of this Order, unless an alternative reporting level is approved by the Regional Water Board's Executive Officer. When there is more than one RL value for a given substance, the Discharger shall select the RL value that is below the calculated effluent limitation, and use its associated analytical method, listed in Attachment "H" of the M&RP. If no RL value is below the effluent limitation, then the Regional Water Board will select the lowest RL value and its associated analytical method.

- K. Non-Priority Pollutants.** The discharge shall be considered to be in compliance with an effluent limitation if the arithmetic mean of all test results for the monitoring period is less than the constituent effluent limitation. Analytical results that are less than the approved reporting limit shall be assigned a value of zero.

**L. Selenium Limits.**

1. For Working Group Members: With regard to the selenium contained in the discharges subject to this Order by the Discharger as a NSMP Working Group member, compliance with the requirements specified in V.A.1.b. provides interim compliance with the requirements contained in Discharge Prohibitions III.B., Receiving Water Limitations VI.A.2.i. and VI.A.3.; and Provision VII.A.2.

---

<sup>11</sup> Minimum level is the concentration at which the entire analytical system must give a recognizable signal and acceptable point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

2. For Non-Working Group Members: With regard to the selenium contained in the discharges subject to this Order by the Discharger as a non-NSMP Working Group member, compliance with the requirements specified in V.A.1.d., provides interim compliance with the requirements contained in Discharge Prohibitions IV.B., Receiving Water Limitations , VI.A.1., VI.A.2.i., and VI.A.3.; and Provisions VII.A.2.

#### **M. Nitrogen Limits.**

The Discharger will also be deemed in compliance with the requirements of Receiving Water Limitations VI.A.1. and VI.A.2.i., when the Discharger is either in compliance with the nitrogen limit specified in Discharge Specifications V.A.4. or when the Discharger implements an acceptable offset program for nitrogen discharges.

**NOTICE OF INTENT**

TO COMPLY WITH THE TERMS AND CONDITIONS OF THE GENERAL DISCHARGE PERMIT FOR DISCHARGES TO SURFACE WATERS OF GROUNDWATER RESULTING FROM GROUNDWATER DEWATERING OPERATIONS AND/OR GROUNDWATER CLEANUP ACTIVITIES AT SITES WITHIN THE SAN DIEGO CREEK/NEWPORT BAY WATERSHED POLLUTED BY PETROLEUM HYDROCARBONS, SOLVENTS, METALS AND/OR SALTS  
(Order No. R8-2007-0041, NPDES No. CAG918002)

| 398  | 19.6      | 6.4          | 5382.5         | 641.6        | 49.4      | 29.2         | 326.9     | 12.7         | 1506.5    | 167.3        | 37.1      | —            | 377.7     | 380.8        |
| 399  | 19.7      | 6.4          | 5393.6         | 642.9        | 49.5      | 29.2         | 328.0     | 12.8         | 1509.7    | 167.7        | 37.3      | —            | 378.5     | 381.6        |
| 400  | 19.7      | 6.4          | 5404.6         | 644.2        | 49.6      | 29.3         | 329.0     | 12.8         | 1512.9    | 168.0        | 37.4      | —            | 379.3     | 382.4        |

## **ATTACHMENT D – STANDARD PROVISIONS**

### **I. STANDARD PROVISIONS – PERMIT COMPLIANCE**

#### **A. Duty to Comply**

1. The Discharger must comply with all of the conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code (CWC) and is grounds for enforcement action, for permit termination, revocation and reissuance, or modification; or denial of a permit renewal application [40 CFR §122.41(a)].
2. The Discharger shall comply with effluent standards or prohibitions established under Section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under Section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not yet been modified to incorporate the requirement [40 CFR §122.41(a)(1)].

#### **B. Need to Halt or Reduce Activity Not a Defense**

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order [40 CFR §122.41(c)].

#### **C. Duty to Mitigate**

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment [40 CFR §122.41(d)].

#### **D. Proper Operation and Maintenance**

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order [40 CFR §122.41(e)].

#### **E. Property Rights**

1. This Order does not convey any property rights of any sort or any exclusive privileges [40 CFR §122.41(g)].

2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of State or local law or regulations [40 CFR §122.5(c)].

## **F. Inspection and Entry**

The Discharger shall allow the Regional Water Quality Control Board (RWQCB), State Water Resources Control Board (SWRCB), United States Environmental Protection Agency (USEPA), and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to [40 CFR §122.41(i)] [CWC 13383(c)]:

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order [40 CFR §122.41(i)(1)];
2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order [40 CFR §122.41(i)(2)];
3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order [40 CFR §122.41(i)(3)];
4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the CWC, any substances or parameters at any location [40 CFR §122.41(i)(4)].

## **G. Bypass**

1. Definitions
  - a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility [40 CFR §122.41(m)(1)(i)].
  - b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production [40 CFR §122.41(m)(1)(ii)].
2. Bypass not exceeding limitations – The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3, I.G.4, and I.G.5 below [40 CFR §122.41(m)(2)].

3. Prohibition of bypass – Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless [40 CFR §122.41(m)(4)(i)]:
  - a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage [40 CFR §122.41(m)(4)(A)];
  - b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance [40 CFR §122.41(m)(4)(B)]; and
  - c. The Discharger submitted notice to the Regional Water Board as required under Standard Provisions – Permit Compliance I.G.5 below [40 CFR §122.41(m)(4)(C)].
4. The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions – Permit Compliance I.G.3 above [40 CFR §122.41(m)(4)(ii)].
5. Notice
  - a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass [40 CFR §122.41(m)(3)(i)].
  - b. Unanticipated bypass. The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below (24-hour notice) [40 CFR Section 122.41(m)(3)(ii)].

## H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the permittee. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation [40 CFR §122.41(n)(1)].

1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of Standard Provisions – Permit Compliance I.H.2 below are met. No determination made during administrative review of claims that noncompliance was

caused by upset, and before an action for noncompliance, is final administrative action subject to judicial review [40 CFR Section 122.41(n)(2)].

2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that [40 CFR §122.41(n)(3)]:
  - a. An upset occurred and that the Discharger can identify the cause(s) of the upset [40 CFR §122.41(n)(3)(i)];
  - b. The permitted facility was, at the time, being properly operated [40 CFR §122.41(n)(3)(i)];
  - c. The Discharger submitted notice of the upset as required in Standard Provisions – Reporting V.E.2.b below (24-hour notice) [40 CFR Section 122.41(n)(3)(iii)]; and
  - d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above [40 CFR §122.41(n)(3)(iv)].
3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof [40 CFR §122.41(n)(4)].

## II. STANDARD PROVISIONS – PERMIT ACTION

### A. General

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition [40 CFR §122.41(f)].

### B. Duty to Reapply

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit [40 CFR §122.41(b)].

### C. Transfers

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the CWC [40 CFR §122.41(l)(3)] [40 CFR §122.61].

### **III. STANDARD PROVISIONS – MONITORING**

- A.** Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity [40 CFR §122.41(j)(1)].
- B.** Monitoring results must be conducted according to test procedures under 40 CFR Part 136 or, in the case of sludge use or disposal, approved under 40 CFR Part 136 unless otherwise specified in 40 CFR Part 503 unless other test procedures have been specified in this Order [40 CFR §122.41(j)(4)] [40 CFR §122.44(i)(1)(iv)].

### **IV. STANDARD PROVISIONS – RECORDS**

- A.** Except for records of monitoring information required by this Order related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by 40 CFR Part 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time [40 CFR §122.41(j)(2)].

**B. Records of monitoring information shall include:**

- 1. The date, exact place, and time of sampling or measurements [40 CFR §122.41(j)(3)(i)];
- 2. The individual(s) who performed the sampling or measurements [40 CFR §122.41(j)(3)(ii)];
- 3. The date(s) analyses were performed [40 CFR §122.41(j)(3)(iii)];
- 4. The individual(s) who performed the analyses [40 CFR §122.41(j)(3)(iv)];
- 5. The analytical techniques or methods used [40 CFR §122.41(j)(3)(v)]; and
- 6. The results of such analyses [40 CFR §122.41(j)(3)(vi)].

**C. Claims of confidentiality for the following information will be denied [40 CFR §122.7(b)]:**

- 1. The name and address of any permit applicant or Discharger [40 CFR §122.7(b)(1)]; and

2. Permit applications and attachments, permits and effluent data [*40 CFR §122.7(b)(2)*].

## **V. STANDARD PROVISIONS – REPORTING**

### **A. Duty to Provide Information**

The Discharger shall furnish to the Regional Water Board, SWRCB, or USEPA within a reasonable time, any information which the Regional Water Board, SWRCB, or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Regional Water Board, SWRCB, or USEPA copies of records required to be kept by this Order [*40 CFR §122.41(h)*] [*CWC 13267*].

### **B. Signatory and Certification Requirements**

1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or USEPA shall be signed and certified in accordance with Standard Provisions – Reporting V.B.2, V.B.3, V.B.4, and V.B.5 below [*40 CFR Section 122.41(k)*].
2. All permit applications shall be signed by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes: (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of USEPA) [*40 CFR Section 122.22(a)(3)*].
3. All reports required by this Order and other information requested by the Regional Water Board, State Water Board, or USEPA shall be signed by a person described in Standard Provisions – Reporting V.B.2 above, or by a duly authorized representative of that person. A person is a duly authorized representative only if:
  - a. The authorization is made in writing by a person described in Standard Provisions – Reporting V.B.2 above [*40 CFR Section 122.22(b)(1)*];
  - b. The authorization specified either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company (A duly authorized representative may thus be either a named individual or any individual occupying a named position.) [*40 CFR Section 122.22(b)(2)*]; and
  - c. The written authorization is submitted to the Regional Water Board and State Water Board [*40 CFR Section 122.22(b)(3)*].

4. If an authorization under Standard Provisions – Reporting V.B.3 above is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of Standard Provisions – Reporting V.B.3 above must be submitted to the Regional Water Board, State Water Board or USEPA prior to or together with any reports, information, or applications, to be signed by an authorized representative [40 CFR Section 122.22(c)].
5. Any person signing a document under Standard Provisions – Reporting V.B.2 or V.B.3 above shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations" [40 CFR Section 122.22(d)].

### **C. Monitoring Reports**

1. Monitoring results shall be reported at the intervals specified in the Monitoring and Reporting Program (Attachment E) in this Order [40 CFR §122.41(l)(4)].
2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or SWRCB for reporting results of monitoring of sludge use or disposal practices [40 CFR §122.41(l)(4)(i)].
3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under 40 CFR Part 136 or, in the case of sludge use or disposal, approved under 40 CFR Part 136 unless otherwise specified in 40 CFR Part 503, or as specified in this Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Regional Water Board [40 CFR §122.41(l)(4)(ii)].
4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order [40 CFR §122.41(l)(4)(iii)].

### **D. Compliance Schedules**

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date [40 CFR §122.41(l)(5)].

## **E. Twenty-Four Hour Reporting**

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance [40 CFR §122.41(l)(6)(i)].
2. The following shall be included as information that must be reported within 24 hours under this paragraph [40 CFR §122.41(l)(6)(ii)]:
  - a. Any unanticipated bypass that exceeds any effluent limitation in this Order [40 CFR §122.41(l)(6)(ii)(A)].
  - b. Any upset that exceeds any effluent limitation in this Order [40 CFR §122.41(l)(6)(ii)(B)].
3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours [40 CFR §122.41(l)(6)(iii)].

## **F. Planned Changes**

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when [40 CFR §122.41(l)(1)]:

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR §122.29(b) [40 CFR §122.41(l)(1)(i)]; or
2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which are subject neither to effluent limitations in this Order nor to notification requirements under 40 CFR Part 122.42(a)(1) (see Additional Provisions—Notification Levels VII.A.1) [40 CFR §122.41(l)(1)(ii)].
3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during

the permit application process or not reported pursuant to an approved land application plan [40 CFR §122.41(l)(1)(iii)].

#### **G. Anticipated Noncompliance**

The Discharger shall give advance notice to the Regional Water Board or SWRCB of any planned changes in the permitted facility or activity that may result in noncompliance with General Order requirements [40 CFR §122.41(l)(2)].

#### **H. Other Noncompliance**

The Discharger shall report all instances of noncompliance not reported under Standard Provisions – Reporting V.C, V.D, and V.E above at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E above [40 CFR Section 122.41(l)(7)].

#### **I. Other Information**

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Water Board, SWRCB, or USEPA, the Discharger shall promptly submit such facts or information [40 CFR §122.41(l)(8)].

### **VI. STANDARD PROVISIONS – ENFORCEMENT**

- A.** The Regional Water Board is authorized to enforce the terms of this permit under several provisions of the CWC, including, but not limited to, sections 13385, 13386, and 13387.

### **VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS**

#### **A. Publicly-Owned Treatment Works (POTWs)**

All POTWs shall provide adequate notice to the Regional Water Board of the following [40 CFR Section 122.42(b)]:

1. Any new introduction of pollutants into the POTW from an indirect discharger that would be subject to Sections 301 or 306 of the CWA if it were directly discharging those pollutants [40 CFR Section 122.42(b)(1)]; and
2. Any substantial change in the volume or character of pollutants being introduced into that POTW by a source introducing pollutants into the POTW at the time of adoption of the Order [40 CFR Section 122.42(b)(2)].

3. Adequate notice shall include information on the quality and quantity of effluent introduced into the POTW as well as any anticipated impact of the change on the quantity or quality of effluent to be discharged from the POTW [*40 CFR Section 122.42(b)(3)*].

## **Attachment E – Monitoring and Reporting Program (MRP)**

The Code of Federal Regulations (CFR) at 40 CFR §122.48 requires that all NPDES permits specify monitoring and reporting requirements. CWC Sections 13267 and 13383 also authorize the Regional Water Quality Control Board (Regional Water Board) to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements that implement the federal and California regulations.

### **I. GENERAL MONITORING PROVISIONS**

#### **A. General Monitoring Provision**

1. All sampling and sample preservation shall be in accordance with the current edition of "Standard Methods for the Examination of Water and Wastewater" (American Public Health Association).
2. All laboratory analyses shall be performed in accordance with test procedures under 40 CFR 136 (revised as of April 11, 2007) "Guidelines Establishing Test Procedures for the Analysis of Pollutants," promulgated by the United States Environmental Protection Agency (EPA), unless otherwise specified in this MRP. In addition, the Regional Water Board and/or EPA, at their discretion, may specify test methods that are more sensitive than those specified in 40 CFR 136.
3. Chemical, bacteriological, and bioassay analyses shall be conducted at a laboratory certified for such analyses by the California Department of Public Health in accordance with the provision of Water Code Section 13176, and must include quality assurance/quality control data with their reports, or EPA or at laboratories approved by the Regional Water Board's Executive Officer.
4. Whenever the Discharger monitors any pollutant more frequently than is required by this Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the discharge monitoring report specified by the Executive Officer.
5. In conformance with federal regulations 40 CFR 122.45(c), analyses to determine compliance with the effluent limitations for metals shall be conducted using the total recoverable method. For Chromium (VI), the dissolved method in conformance with 40 CFR 136 may be used to measure compliance with the Chromium (VI) limitation.

6. For effluent wastewater monitoring:

- a. The Discharger shall require its testing laboratory to calibrate the analytical system down to the minimum level (ML)<sup>1</sup> specified in Attachment "H" for priority pollutants with effluent limitations in this Order, unless an alternative reporting level is approved by the Regional Water Board's Executive Officer. When there is more than one ML value for a given substance, the Discharger shall use the ML values, and their associated analytical methods, listed in Attachment "H" that are below the calculated effluent limitation. The Discharger may select any one of those cited analytical methods for compliance determination. If no ML value is below the effluent limitation, then the lowest ML value and its associated analytical method, listed in Attachment "H" shall be used. Any internal quality control data associated with the sample must be reported when requested by the Executive Officer. The Regional Water Board will reject the quantified laboratory data if quality control data is unavailable or unacceptable.
- b. The Discharger shall report the results of analytical determinations for the presence of chemical constituents in a sample using the following reporting protocols:
  - (1) Sample results greater than or equal to the reported ML shall be reported as measured by the laboratory (i.e., the measured chemical concentration in the sample).
  - (2) Sample results less than the reported ML, but greater than or equal to the laboratory's current Method Detection Limit (MDL)<sup>2</sup>, shall be reported as "Detected, but Not Quantified," or "DNQ." The estimated chemical concentration of the sample shall also be reported.
  - (3) Sample results not detected above the laboratory's MDL shall be reported as "not detected" or "ND."
- c. The Discharger shall submit to the Regional Water Board reports necessary to determine compliance with effluent limitations in this Order and shall follow the chemical nomenclature and sequential order of priority pollutant constituents shown in Attachment "G" – Priority Pollutant Lists. The Discharger shall report with each sample result:
  - (1) The reporting level achieved by the testing laboratory; and

---

<sup>1</sup> Minimum level is the concentration at which the entire analytical system must give a recognizable signal and acceptable point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

<sup>2</sup> MDL is the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analytical concentration is greater than zero, as defined in 40 CFR 136, Appendix B, revised as of April 11, 2007.

- (2) The laboratory's current MDL, as determined by the procedure found in 40 CFR 136 (revised as of April 11, 2007).
- d. For receiving water monitoring and for those priority pollutants without effluent limitations, the Discharger shall require its testing laboratory to quantify constituent concentrations to the lowest achievable MDL as determined by the procedure found in 40 CFR 136 (revised as of April 11, 2007). In situations where the most stringent applicable receiving water objective (freshwater or human health (consumption of organisms only), as specified for that pollutant in 40 CFR 131.38<sup>3</sup> is below the minimum level value specified in Attachment "H" and the Discharger cannot achieve an MDL value for that pollutant below the ML value, the Discharger shall submit justification why a lower MDL value cannot be achieved. Justification shall be submitted together with monthly monitoring reports.
7. For non-priority pollutants monitoring, all analytical data shall be reported with method detection limits, as determined by the procedure found in 40 CFR 136 (revised as of April 11, 2007).
8. The Discharger shall have, and implement an acceptable written quality assurance (QA) plan for laboratory analyses. Duplicate chemical analyses must be conducted on a minimum of ten percent (10%) of the samples, or at least one sample per month, whichever is greater. A similar frequency shall be maintained for analyzing spiked samples. When requested by the Regional Water Board or EPA, the Discharger will participate in the NPDES discharge monitoring report QA performance study.
9. For every item of monitoring data where the requirements are not met, the monitoring report shall include a statement discussing the reasons for noncompliance, the actions undertaken or proposed that will bring the discharge into full compliance with requirements at the earliest time, and an estimate of the date when the Discharger will be in compliance. The Discharger shall notify the Regional Water Board by letter when compliance with the time schedule has been achieved.
10. The Discharger shall assure that records of all monitoring information are maintained and accessible for a period of at least five years (this retention period supercedes the retention period specified in Section IV.A. of Attachment D) from the date of the sample, report, or application. This period of retention shall be extended during the course of any unresolved litigation regarding this discharge or by the request of the Regional Water Board at any time. Records of monitoring information shall include:
- a. The information listed in Attachment D- IV Standard Provisions – Records, subparagraph B. of this Order;
  - b. The laboratory which performed the analyses;
  - c. The date(s) analyses were performed;

- d. The individual(s) who performed the analyses;
  - e. The modification(s) to analytical techniques or methods used;
  - f. All sampling and analytical results, including
    - (1) Units of measurement used;
    - (2) Minimum reporting level for the analysis (minimum level);
    - (3) Results less than the reporting level but above the method detection limit (MDL);
    - (4) Data qualifiers and a description of the qualifiers;
    - (5) Quality control test results (and a written copy of the laboratory quality assurance plan);
    - (6) Dilution factors, if used; and
    - (7) Sample matrix type.
  - g. All monitoring equipment calibration and maintenance records;
  - h. All original strip charts from continuous monitoring devices;
  - i. All data used to complete the application for this Order; and,
  - j. Copies of all reports required by this Order.
  - k. Electronic data and information generated by the Supervisory Control And Data Acquisition (SCADA) System.
11. The flow measurement system shall be calibrated at least once per year or more frequently, to ensure continued accuracy.
12. All monitoring instruments and devices used by the Discharger to fulfill the prescribed monitoring program shall be properly maintained and calibrated as necessary to ensure their continued accuracy. In the event that continuous monitoring equipment is out of service for greater than a 24-hour period, the Discharger shall obtain a representative grab sample each day the equipment is out of service. The Discharger shall correct the cause(s) of failure of the continuous monitoring equipment as soon as practicable. In its monitoring report, the Discharger shall specify the period(s) during which the equipment was out of service and if the problem has not been corrected, shall identify the steps which the Discharger is taking or proposes to take to bring the equipment back into service and the schedule for these actions.
13. Monitoring and reporting shall be in accordance with the following:
- a. Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity.
  - b. The monitoring and reporting of influent, effluent, and sludge shall be done more frequently as necessary to maintain compliance with this Order and or as specified in this order.
  - c. Whenever the Discharger monitors any pollutant more frequently than is required by this Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the discharge monitoring report specified by the Executive Officer.
  - d. A "grab" sample is defined as any individual sample collected in less than 15 minutes.

- e. A composite sample is defined as a combination of no fewer than eight individual grab samples obtained over the specified sampling period. The volume of each individual grab sample shall be proportional to the discharge flow rate at the time of sampling. The compositing period shall equal the specific sampling period, or 24 hours, if no period is specified.
- f. Daily samples shall be collected on each day of the week.
- g. Monthly samples shall be collected on any representative day of each month.
- h. Quarterly samples: A representative sample shall be taken on any representative day of January, April, July, and October and test results shall be reported in either micrograms/liter (ug/L) or milligrams/liter (mg/L), as appropriate, by the last day of the month following the month that the sample was taken.
- i. Semi-annual samples shall be collected in January and July.
- j. Annual samples shall be collected in accordance with the following schedule:

**Table 1. Annual Sampling Schedule**

| Year | Annual Samples |
|------|----------------|
| 2007 | October        |
| 2008 | January        |
| 2009 | April          |
| 2010 | July           |
| 2011 | October        |
| 2012 | January        |

14. The discharger shall multiply each measured or estimated congener concentration by its respective toxic equivalency factor (TEF) as shown below and report the sum of these values. The discharger shall use the U.S. EPA approved test method 1613 for dioxins and furans. Dioxin testing is required for new dischargers only.

**Table 2. Toxic Equivalency Factors for 2,3,7, 8-TCDD Equivalents**

| Congener               | TEF    |
|------------------------|--------|
| 2,3,7,8-TetraCDD       | 1      |
| 1,2,3,7,8-PentaCDD     | 1.0    |
| 1,2,3,4,7,8-HexaCDD    | 0.1    |
| 1,2,3,6,7,8-HexaCDD    | 0.1    |
| 1,2,3,7,8,9-HexaCDD    | 0.1    |
| 1,2,3,4,6,7,8-HeptaCDD | 0.01   |
| OctaCDD                | 0.0001 |
| 2,3,7,8-TetraCDF       | 0.1    |
| 1,2,3,7,8-PentaCDF     | 0.05   |
| 2,3,4,7,8-PentaCDF     | 0.5    |
| 1,2,3,4,7,8-HexaCDF    | 0.1    |
| 1,2,3,6,7,8-HexaCDF    | 0.1    |
| 1,2,3,7,8,9-HexaCDF    | 0.1    |
| 2,3,4,6,7,8-HexaCDF    | 0.1    |
| 1,2,3,4,6,7,8-HeptaCDF | 0.01   |
| 1,2,3,4,7,8,9-HeptaCDF | 0.01   |
| OctaCDF                | 0.0001 |

## B. Laboratory Certification

Laboratories analyzing monitoring samples shall be certified by the Department of Public Health, in accordance with the provision of Water Code section 13176, and must include quality assurance/quality control data with their reports.

## II. MONITORING LOCATIONS

The Discharger shall establish monitoring locations to demonstrate compliance with the effluent limitations, discharge specifications, and other requirements in this Order. The sample station shall be located where representative samples can be obtained before the extracted groundwater is treated and discharged. The volume of daily extracted groundwater shall be recorded daily on a permanent log.

## III. INFLUENT MONITORING REQUIREMENTS

A grab<sup>4</sup> sample of the influent to the treatment system shall be monitored on a monthly basis for compounds using EPA method 8260B and for total petroleum hydrocarbons.

## IV. EFFLUENT MONITORING REQUIREMENTS

A. The following shall constitute the effluent monitoring program:

**Table 3. Effluent Monitoring Program**

| Parameter <sup>5</sup>                    | Unit | Sample Type | Minimum Sampling Frequency               | Required Analytical Test Method and Minimum Level, units, respectively |
|---|------|-------------|--|--|
| Flow                                      | mgd  | -----       | Daily for one week and weekly thereafter | See Section I.A.3. above, of this MRP                                  |
| Total Petroleum Hydrocarbons <sup>6</sup> | µg/L | Grab        | Weekly                                   | EPA METHOD 8015 Modified   |
| Benzene                                   | µg/L | Grab        | Weekly                                   | EPA Method 8260  |
| Toluene                                   | µg/L | Grab        | Weekly                                   | "  |

<sup>4</sup> A "grab" sample is defined as any individual sample collected in less than 15 minutes.

<sup>5</sup> For testing organic volatile compounds use EPA Method 8260B and report entire suite of detected constituents.

<sup>6</sup> Total Petroleum Hydrocarbons by method 8015 modified for gasoline and/or diesel, if present.

**Table 3. Effluent Monitoring Program**

| <b>Parameter<sup>5</sup></b>        | <b>Unit</b> | <b>Sample Type</b> | <b>Minimum Sampling Frequency</b> | <b>Required Analytical Test Method and Minimum Level, units, respectively</b> |
|-------------------------------------|-------------|--------------------|-----------------------------------|---|
| Xylene (total)                      | µg/L        | Grab               | Weekly                            | EPA Method 8260"  |
| 1,2,3-Trichloropropane <sup>7</sup> | µg/L        | Grab               | Weekly                            | "   |
| Ethylbenzene                        | µg/L        | Grab               | Weekly                            | EPA Method 8260   |
| Carbon Tetrachloride                | µg/L        | Grab               | Weekly                            | "   |
| Chloroform                          | µg/L        | Grab               | Weekly                            | "   |
| Dichlorobromomethane                | µg/L        | Grab               | Weekly                            | "   |
| Methyl Ethyl Ketone                 | µg/L        | Grab               | Weekly                            | "   |
| Methyl Isobutyl Ketone              | µg/L        | Grab               | Weekly                            | "   |
| Methyl Tertiary Butyl Ether (MTBE)  | µg/L        | Grab               | Weekly                            | "   |
| Naphthalene                         | µg/L        | Grab               | Weekly                            | "   |
| Tetrachloroethylene (PCE)           | µg/L        | Grab               | Weekly                            | "   |
| Trichloroethylene (TCE)             | µg/L        | Grab               | Weekly                            | "   |
| 1,1-Dichloroethane (1,1-DCA)        | µg/L        | Grab               | Weekly                            | "   |
| 1,2-Dichloroethane (1,2-DCA)        | µg/L        | Grab               | Weekly                            | "   |
| 1,1-Dichloroethylene (1,1-DCE)      | µg/L        | Grab               | Weekly                            | "   |
| 1,2-Dichloroethylene (cis)          | µg/L        | Grab               | Weekly                            | "   |
| 1,2-Dichloroethylene (trans)        | µg/L        | Grab               | Weekly                            | "   |
| 1,1,1-Trichloroethane (1,1,1-TCA)   | µg/L        | Grab               | Weekly                            | "   |
| 1,4-Dioxane                         | µg/L        | Grab               | Weekly                            | "   |
| Tert Butyl Alcohol (TBA)            | µg/L        | Grab               | Weekly                            | "   |
| Vinyl Chloride                      | µg/L        | Grab               | Weekly                            | "   |
| Acrolein                            | µg/L        | Grab               | Weekly                            | "   |
| Acrylonitrile                       | µg/L        | Grab               | Weekly                            | "   |
| Ethylene Dibromide (EDB)            | µg/L        | Grab               | Weekly                            | "   |
| Perchlorate                         | µg/L        | Grab               | Weekly                            | See Section I.A. 2, 3. above, of this MRP                                     |
| Total Phenols                       | mg/L        | Grab               | Weekly                            | See Section I.A. 2, 3. above, of this MRP                                     |

**Table 3. Effluent Monitoring Program**

| Parameter <sup>5</sup>                            | Unit       | Sample Type | Minimum Sampling Frequency                     | Required Analytical Test Method and Minimum Level, units, respectively                    |
|---|------------|-------------|--|---|
| Total Residual Chlorine <sup>8</sup>              | mg/L       | Grab        | Weekly for the first month, monthly thereafter | See Section I.A.2. & I.A.3. above, of this MRP  |
| Total Suspended Solids                            | mg/L       | "           | "  | "   |
| Oil and Grease                                    | mg/L       | "           | "  | "   |
| Total Inorganic Nitrogen (TIN)                    | mg/L       | "           | "  | "   |
| Total Phosphorous                                 | mg/L       | "           | "  | "   |
| Sulfide   | mg/L       | "           | "  | "   |
| Coliform Organisms <sup>9</sup>                   | MPN        | "           | "  | "   |
| Methylene Blue Activated Substances (MBAS)        | mg/L       | "           | "  | "   |
| Total DDT   | µg/L       | "           | See paragraph IV.B., below                     | Reporting Level shall have prior approval by Regional Board Executive Officer or designee |
| Chlordane   | µg/L       | "           | "  |   |
| Total PCBs  | µg/L       | "           | "  |   |
| Toxaphene   | µg/L       | "           | "  |   |
| Total Arsenic                                     | µg/L       | Grab        | See paragraph IV.B., below                     | See Section I.A.2. & I.A.3. above, of this MRP  |
| Total Recoverable Selenium                        | "          | "           | "  | "   |
| Total Recoverable Cadmium <sup>10</sup>           | "          | "           | "  | "   |
| Total Recoverable & Dissolved Copper <sup>9</sup> | "          | "           | "  | "   |
| Total Recoverable & Dissolved Lead <sup>9</sup>   | "          | "           | "  | "   |
| Total Recoverable Nickel <sup>9</sup>             | "          | "           | "  | "   |
| Total Recoverable & Dissolved Zinc <sup>9</sup>   | µg/L       | "           | "  | "   |
| pH  | Std. Units | "           | "  | "   |
| Temperature                                       | °F         | "           | "  | "   |

<sup>8</sup> If chlorine is used for treatment or disinfection of wastes.

<sup>9</sup> Only for groundwater dewatering projects in the vicinity of active sewer lines.

<sup>10</sup> This constituent shall be monitored for four sampling events. If all four sample test results pursuant to IV.B., whichever is applicable, result in non-detection, no further monitoring for this constituent is required.

**Table 3. Effluent Monitoring Program**

| <b>Parameter<sup>5</sup></b>  | <b>Unit</b>                | <b>Sample Type</b> | <b>Minimum Sampling Frequency</b>                          | <b>Required Analytical Test Method and Minimum Level, units, respectively</b> |
|---|----------------------------|--------------------|--|---|

| Toxicity Testing (see Section V., below)                            | Pass/<br>Fail              | Grab               | At the initiation of the project and annually thereafter   | See Section I.A.2. & I.A.3. above, of this MRP                                |

**B. Minimum Frequency of Sampling & Analysis:**

- a. For projects that result in discharges of wastewater of 1 million gallons per day (mgd) or more, daily grab samples for four consecutive days shall be taken and analyzed individually for the constituent required to be monitored. Subsequent samples shall be taken and analyzed once quarterly, unless directed otherwise by the Regional Board Executive Officer. If the discharge does not last for more than a day, one composite sample taken for the duration of the discharge shall be analyzed;
- b. For all other projects that result in discharges of wastewater of less than 1 mgd, weekly sampling and analyses shall be conducted for the first month. Subsequent sampling and analyses shall be conducted once quarterly, unless directed otherwise by the Regional Board Executive Officer.

**C. Total nitrogen and total recoverable selenium offset monitoring and reporting:**

- a. Dischargers responsible for providing a nitrogen and/or selenium offset shall assure that sufficient monitoring of influent and effluent flow, total nitrogen including particulate organic nitrogen (specifically for San Joaquin Marsh wetlands ponds treatment system effluent discharges), and/or total selenium concentrations, as appropriate, from the facility(ies) providing the offset is conducted to demonstrate that the requisite offset(s) of the discharger's nitrogen and/or selenium load is achieved.
- b. Provide documentation necessary to demonstrate that implementation of the offset(s) results in requisite reduction of total nitrogen and selenium as applicable.
- c. If no offset occurs during the monitoring period, a letter to that effect shall be submitted in lieu of a monitoring report. The letter shall include a justification for the failure to provide the offset.

**V. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS**

**A. Toxicity Monitoring Requirements**

1. The discharger shall conduct acute toxicity testing as specified in Methods for Measuring the Acute Toxicity of Effluents to Freshwater and Marine Organisms (EPA/821-R-02-012, October 2002). Using a control and 100% effluent, static renewal survival (pass/fail) tests for 96 hours shall be conducted using the two test species specified in the table below corresponding to the onsite groundwater salinity, for the first required annual test under this permit. Based on the results, the Discharger shall determine the most sensitive test species. For the required succeeding toxicity monitoring, the Discharger shall use the most sensitive species with prior approval from the Regional Board Executive Officer. The Discharger shall submit documentation supporting the Discharger's determination of the most sensitive test species. The effluent tests must be conducted concurrent with reference toxicant tests. The effluent and reference toxicant tests must meet all test

acceptability criteria as specified in the acute manual<sup>11</sup>. If the test acceptability criteria are not achieved, then the discharger must re-sample and re-test within 14 days. The test results must be reported according to the acute manual chapter on Report Preparation, and shall be attached to the monitoring reports. The use of alternative methods for measuring acute toxicity may be considered by the Executive Officer on a case-by-case basis.

**Table 4. Test Species**

| If the Effluent or Receiving Water Salinity is: | Test Species                               | Test                 |
|---|--|----------------------|
| Less than 1,000 mg/l salinity                   | Fathead minnow, <i>Pimphales promelas</i>  | Larval survival test |
|   | Water flea, <i>Ceriodaphnia dubia</i>      | Survival test        |
| Equal to or greater than 1,000 mg/l salinity    | Silverside, <i>Menedia beryllina</i>       | Survival Test        |
|   | Pacific mysid, <i>Holmesimysis costata</i> | Survival Test        |

- In the event that the required annual toxicity test fails, the Discharger shall stop any discharge of wastewater to waters of the U.S. and shall retest within 14 days of receiving the notice of failure and shall determine the cause of the failure. The Discharger shall stop any discharge of wastewater to waters of the U.S. until such time that the cause of toxicity is determined and appropriately addressed. Commencement of any discharge shall be with prior approval by the Executive Officer.

#### VI. LAND DISCHARGE MONITORING REQUIREMENTS – NOT APPLICABLE.

#### VII. RECEIVING WATER MONITORING REQUIREMENTS – NOT APPLICABLE

#### VIII. REPORTING REQUIREMENTS

##### A. General Monitoring and Reporting Requirements

- The Discharger shall comply with all Standard Provisions (Attachment D) related to monitoring, reporting, and recordkeeping.
- All analytical data shall be reported with method detection limit<sup>12</sup> (MDLs) and with identification of either reporting level or limits of quantitation (LOQs).

<sup>11</sup> "Acute manual" refers to protocols described in "Methods for Measuring the Acute Toxicity of Effluents to Freshwater and Marine Organisms" (EPA/821-R-02-012, October 2002).

<sup>12</sup> The standardized test procedure to be used to determine the method detection limit (MDL) is given at Appendix B, 'Definition and Procedure for the Determination of the Method Detection Limit' of 40 CFR 136.

3. Laboratory data for effluent samples must quantify each constituent down to the down to ML specified in Attachment "H" for priority pollutants. Any internal quality control data associated with the sample must be reported when requested by the Executive Officer. The Regional Water Board will reject the quantified laboratory data if quality control data is unavailable or unacceptable.
4. Discharge monitoring data shall be submitted in a format acceptable by the Regional Water Board. Specific reporting format may include preprinted forms and/or electronic media. The results of all monitoring required by this Order shall be reported to the Regional Water Board, and shall be submitted in such a format as to allow direct comparison with the limitations and requirements of this Order.
5. The Discharger shall submit to the Regional Water Board reports necessary to determine compliance with effluent limitations in this Order and shall follow the chemical nomenclature and sequential order of priority pollutant constituents shown in Attachment "G" – Priority Pollutant Lists. The Discharger shall report with each sample result:
  - a. The reporting level achieved by the testing laboratory; and
  - b. The laboratory's current MDL, as determined by the procedure found in 40 CFR 136 (revised as of April 11, 2007).
6. For those priority pollutants without effluent limitations, the Discharger shall require its testing laboratory to quantify constituent concentrations to the lowest achievable MDL as determined by the procedure found in 40 CFR 136 (revised as of April 11, 2007). In situations where the most stringent applicable receiving water objective (freshwater or human health (consumption of organisms only), as specified for that pollutant in 40 CFR 131.38<sup>13</sup> is below the minimum level value specified in Attachment "H" and the Discharger cannot achieve an MDL value for that pollutant below the ML value, the Discharger shall submit justification why a lower MDL value cannot be achieved. Justification shall be submitted together with monthly monitoring reports.
7. For non-priority pollutants monitoring, all analytical data shall be reported with identification of method detection limits, as determined by the procedure found in 40 CFR 136 (revised as of April 11, 2007).
8. The State or Regional Water Board may notify the Discharger to discontinue submittal of hard copies of reports. When such notification is given, the Discharger shall stop submitting hard copies of required monitoring reports.

## **B. Reporting Requirements:**

1. All monitoring reports, or information submitted to the Regional Board shall be signed and certified in accordance with 40 CFR 122.22 and shall be submitted under penalty of perjury.
2. All reports shall be arranged in a tabular format to clearly show compliance or noncompliance with each discharge limitation.
3. One week before groundwater extraction, treatment, and discharge is commenced, the Discharger shall notify the Regional Board or its designated compliance officer by email and/or orally by telephone.
4. If no discharge occurs during the previous monitoring period, a letter to that effect shall be submitted in lieu of a monitoring report.
5. The Discharger shall notify the Regional Board in writing when groundwater treatment and discharge is stopped for more than a week. The report shall include a discussion as to why groundwater remediation is stopped and when treatment will commence.
6. Noncompliance Reporting
  - a. The discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided to the Executive Officer (951-782-4130) and the Office of Emergency Services (1-800-852-7550) orally within 24 hours from the time the discharger becomes aware of the circumstances. A written submission shall also be provided within 5 days of the time the discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause, the period of noncompliance, including exact dates and times and, if the noncompliance has not been corrected, the anticipated time it is expected to continue, and, steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.
  - b. Any violation of a maximum daily discharge limitation for any of the pollutants listed in this Order shall be included as information that must be reported within 24 hours.
  - c. The Regional Board may waive the above required written report on a case-by-case basis.
7. Except for data determined to be confidential under Section 308 of the Clean Water Act (CWA), all reports prepared in accordance with the terms of this Order shall be available for public inspection at the offices of the Regional Water Quality Control Board and the Regional Administrator of EPA. As required by the CWA, effluent data shall not be considered confidential.

8. Monitoring reports shall be submitted by the 30th day of each month following the monitoring period and shall include:
  - a. The results of all chemical analyses for the previous month, and annual samples whenever applicable,
  - b. The daily flow data,
  - c. A summary of the month's activities including a report detailing compliance or noncompliance with the task for the specific schedule date, and
  - d. For every item of monitoring data where the requirements are not met, the monitoring report shall include a statement discussing the reasons for noncompliance, and of the actions undertaken or proposed which will bring the discharger into full compliance with requirements at the earliest time, and an estimate of the date when the discharger will be in compliance. The discharger shall notify the Regional Board by letter when compliance with the time schedule has been achieved.
9. For Dischargers discharging at a volume equal to or greater than 150,000 gallons per day, the Discharger shall submit semi-annual reports that tabulate all measured flows and measured parameters within the most recent six month period. Where discharges associated with these projects last less than 6 months, a report covering the period of discharges shall be submitted. Copies of these monitoring reports shall be submitted to the Regional Board and to the Water Quality Director of the Orange County Water District at P.O. Box 8300, Fountain Valley, CA 92728-8300.

### **C. Self Monitoring Reports (SMRs)**

1. At any time during the term of this permit, the State or Regional Water Board may notify the Discharger to electronically submit Self-Monitoring Reports (SMRs) using the State Water Board's California Integrated Water Quality System (CIWQS) Program Web site (<http://www.waterboards.ca.gov/ciwqs/index.html>). Until such notification is given, the Discharger shall submit hard copy SMRs in accordance with the requirements described in subsection B.5 below. The CIWQS Web site will provide additional directions for SMR submittal in the event there will be service interruption for electronic submittal.
2. The Discharger shall report in the SMR the results for all monitoring specified in this MRP under sections III through IX. Additionally, the Discharger shall report in the SMR the results of any special studies, acute and chronic toxicity testing, TRE/TIE, PMP, and Pollution Prevention Plan required by Special Provisions – VI.C. of this Order. The Discharger shall submit monthly, quarterly, and annual SMRs including the results of all required monitoring using USEPA-approved test methods or other test methods specified in this Order. If the Discharger monitors any pollutant more frequently than required by this Order, the results of this monitoring shall be included in the calculations and reporting of the data submitted in the SMR.

3. Monitoring periods and reporting for all required monitoring shall be completed according to the following schedule:

**Table 5. Monitoring Periods and Reporting Schedule**

| <b>Sampling Frequency</b> | <b>Monitoring Period Begins On...</b>  | <b>Monitoring Period</b>  | <b>SMR Due Date</b>   |
|---------------------------|--|---|---|
| Continuous                | Day after permit effective date  | All   | 30 <sup>th</sup> day of the month following the sampling month. |
| Hourly                    | Day after permit effective date  | Hourly  | 30 <sup>th</sup> day of the month following the sampling month. |
| Daily                     | Day after permit effective date  | Midnight through 11:59 PM or any 24-hour period that reasonably represents a calendar day for purposes of sampling.   | 30 <sup>th</sup> day of the month following the sampling month. |
| Weekly                    | Sunday following permit effective date or on permit effective date if on a Sunday  | Sunday through Saturday   | 30 <sup>th</sup> day of the month following the sampling month. |
| Monthly                   | First day of calendar month following permit effective date or on permit effective date if that date is first day of the month | 1 <sup>st</sup> day of calendar month through last day of calendar month  | 30 <sup>th</sup> day of the month following the sampling month. |
| Quarterly                 | Closest of January 1, April 1, July 1, or October 1 following (or on) permit effective date                                    | January 1 through March 31<br>April 1 through June 30<br>July 1 through September 30<br>October 1 through December 31 | April 30<br>July 30<br>October 30<br>January 30                 |
| Semiannually              | Closest of January 1 or July 1 following (or on) permit effective date   | January 1 through June 30<br>July 1 through December 31   | July 30<br>January 30   |
| Annually                  | See Table 1  | See Table 1   | 30 <sup>th</sup> day of the month following the sampling month. |
| Per Discharge Event       | Anytime during the discharge event or as soon as possible after aware of the event   | At a time when sampling can characterize the discharge event  | 30 <sup>th</sup> day of the month following the sampling month. |

**D. Other Reports – Not Applicable**

## **ATTACHMENT F – FACT SHEET**

This Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this General Permit.

This Order has been prepared under a standardized format to accommodate a broad range of discharge requirements for Dischargers in California. Some sections or subsections of this Order have therefore been identified as “not applicable” to this group of Dischargers. Sections or subsections of this Order not specifically identified as “not applicable” are fully applicable to the Dischargers authorized by the General Permit.

### **I. PERMIT INFORMATION**

Order No. R8-2007-0008, NPDES No. CAG918001 is a general NPDES permit adopted by the Regional Water Board on February 2, 2007, for discharges to surface waters of extracted and treated groundwater resulting from the cleanup of groundwater polluted by petroleum hydrocarbons and/or solvents at service stations and similar sites throughout the Santa Ana Region. This Order facilitated the processing of permit applications and the early implementation of groundwater cleanup projects within the Santa Ana Region. A number of authorizations to discharge under this Order have been issued to Dischargers within the San Diego Creek/Newport Bay Watershed.

Order No. R8-2004-0021, NPDES No. CAG998001 is a general NPDES permit adopted by the Regional Water Board on December 20, 2004, prescribing general waste discharge requirements for discharges to surface waters within the San Diego Creek/Newport Bay watershed. The discharges regulated under this Order include those resulting from hydrostatic testing of vessels, pipelines, and tanks, from the maintenance of potable water supply pipelines, tanks, and reservoirs, from fire hydrant testing or flushing, non-contact cooling water, air conditioning condensate, including those associated with well installation, development, test pumping and purging, aquifer testing wastes, construction dewatering and wastes from subterranean seepage and the like. Order No. R8-2004-0021 also specifies waste discharge requirements for short-term (i.e., one year or less) groundwater-related discharges within the San Diego Creek/Newport Bay watershed to address the presence in the groundwater of nitrates and selenium, and potentially other pollutants of TMDL concern.

Order No. R8-2007-0041 consolidates the requirements of Order No. R8-2007-0008, NPDES No. CAG918001, and Order No. R8-2004-0021, NPDES No. CAG998001, pertaining to groundwater-related discharges in Newport Bay and its watershed. Specifically, the proposed Order includes requirements to regulate groundwater-related discharges that may contain selenium, nutrients, volatile organic compounds, solvents or metals. The intent is to expedite the processing of applications for waste discharge requirements for projects where authorization under both Orders is currently necessary to regulate proposed groundwater-related discharges from a specific site within the San Diego Creek/Newport Bay watershed. The general NPDES permit approach has allowed the Regional Water Board to better utilize limited staff resources. Currently, some Dischargers are authorized under both Order No. R8-2004-0021 and Order No. R8-2007-0008. These

Dischargers are required to obtain authorization under the consolidated Order No. R8-2007-0041.

One Discharger (Nexus Construction Services) received temporary authorization to discharge dewatering wastes under Order No. R8-2004-0021, even though the discharges were not expected to be short-term, i.e., the discharges were expected to last more than one year. This temporary authorization was granted pending adoption of a new Order to regulate long-term groundwater-related discharges. Order No. R8-2007-0041 regulates all new groundwater-related discharges, including long-term dewatering discharges. Nexus Construction Services, which received temporary authorization to discharge under Order No. R8-2004-0021 pending adoption of an appropriate Order, is required to obtain authorization under Order No. R8-2007-0041.

Other short-term groundwater related Dischargers now regulated under Order No. R8-2004-0021 are not required to obtain coverage under Order No. R8-2007-0041. These discharges are expected to be complete prior to the expiration of Order No. R8-2004-0021 in December 2009. Order No. R8-2004-0021 is not expected to be renewed.

In some cases, discharges resulting from groundwater dewatering and/or cleanup operations may be proposed to surface waters that are impaired due to one or more pollutants not regulated by this Order. Where such pollutants are present in proposed discharges but no appropriate permit has yet been issued, temporary authorization to conduct the discharge under the terms and conditions of this Order may be granted by the Executive Officer, provided that (1) the Discharger demonstrates that temporary authorization for wastewater discharges is necessary to allow ongoing cleanup in order to prevent the migration and spread of the pollutants of concern; (2) the Discharger demonstrates that all reasonable efforts to avoid, reduce or eliminate the discharge of impairing constituents to surface waters have been implemented; (3) the Discharger demonstrates that the discharge will not contribute to the impairment of the receiving waters; and, (4) the discharge will be authorized under an appropriate individual or general permit when developed and approved by the Regional Water Board.

## II. NOTIFICATION REQUIREMENTS – GENERAL PERMIT APPLICATION

This Order requires each existing Dischargers regulated under Order No. R8-2007-0008 and/or Order No. R8-2004-0021 who requires ongoing regulatory coverage<sup>1</sup> to submit an updated Notice of Intent form to be covered under this permit.

This Order requires each new Discharger<sup>2</sup> to submit to the Executive Officer an application for the proposed discharge. Submission of the application will constitute a "Notice of Intent" to be covered under this Order. The application for the proposed discharge will require, at the minimum, the following information:

---

<sup>1</sup> For Dischargers covered under only Order No. R8-2004-0021, the NOI must be filed only if the expected duration of the discharge is more than one year from the initiation of the discharge.

<sup>2</sup> "New Discharger" refers to those proposing to discharge wastewater under Order No. R8-2007-0041 and not currently covered under Order No. R8-2007-0008 and/or Order No. R8-2004-0021.

1. Notice of Intent to be covered under this general permit (see Attachment A of this Order).
2. A report that shall include the following:
  - a. Chemical analysis of the untreated groundwater. A representative groundwater sample shall be analyzed for organic pollutants using EPA method 8260B or equivalent. The characterization of the groundwater shall include total arsenic, total recoverable cadmium, total recoverable chromium VI, total recoverable copper, total recoverable lead, total recoverable mercury, total recoverable nickel, total recoverable selenium, total recoverable zinc, organochlorine compounds (Total Chlordane, Total DDT, Toxaphene, and PCBs), dissolved oxygen (DO), sulfate, chloride, electrical conductivity, total dissolved solids, total suspended solids, total nitrogen, total inorganic nitrogen, hardness, and priority pollutants including 1,4-dioxane and perchlorate. The selenium analysis used shall assure analytical detection levels sufficient to assess compliance with the effluent limitations of this Order. Test results shall be reported with Minimum levels (ML) and method detection limit (MDL); laboratory analytical limits shall be sufficient to detect these constituents at the concentrations listed in Tables 1, 2, 3, 4, and Attachment H.
  - b. The name of the proposed receiving water body, including the location (Latitude and Longitude) of the discharge point (s);
  - c. The estimated average and maximum daily flow rates, the start date of discharge (if a new discharge), and the duration of the discharge, and the estimated total volume of the discharge;
  - d. A map showing the path from the point of initial discharge to the ultimate location of discharge;
  - e. A list of known or suspected leaking underground tanks and other facilities or operations which have, or may have impacted the quality of the underlying groundwater within the expected radius of influence of the project;
  - f. A discussion of the proposed dewatering and/or cleanup project (if appropriate), including a review of the extraction system design and the status of definition of free product and dissolved product plumes for sites contaminated with petroleum hydrocarbon or solvents only (as appropriate);
  - g. A description of the proposed treatment system and a certification report on the adequacy of each component of the proposed treatment system along with the associated operation. This certification report shall contain a requirement-by-requirement analysis, based on accepted engineering practice, of how the process(es) and physical design(s) of the treatment system will ensure compliance with this Order. The design engineer shall affix his/her signature and engineering license number to this certification report. The report(s) shall also certify the following:
    - (1) All treatment facility startup and operation instruction manuals are adequate and available to operating personnel;

- (2) All treatment facility maintenance and testing schedules are included in the treatment facility operation and maintenance manual (O&M Manual), which shall be kept readily accessible to onsite operating personnel; and
    - (3) Influent and effluent sampling locations and ports are located in areas where samples representative of the waste stream to be monitored can be easily obtained.
  - h. A discussion of a plan for the prevention of run-on, interception and diversion of runoff, and prevention of infiltration and runoff from contaminated soils stored on-site, if the discharge is associated with a groundwater remediation project and soils containing petroleum projects or other pollutants will be maintained on-site; and
  - i. Any other information deemed necessary by the Executive Officer.
3. A site characterization study that defines the onsite contaminants (petroleum hydrocarbons, solvents, metals and/or salts) and their properties and the three-dimensional extent and concentration of contaminants in the subsurface, and includes a description of the geologic and hydrologic factors that control the migration of the contaminants.
  4. An evaluation of the selenium concentrations in proposed discharges and a determination of whether immediate compliance with the numeric effluent limitations specified in this Order for individual constituents is feasible. If immediate compliance is feasible, then the Discharger can, upon authorization under this Order, discharge in accordance with the numeric effluent limitations and with the remaining terms and conditions of this Order. If immediate compliance with the numeric selenium limitations is infeasible, then the Discharger must demonstrate that it is not reasonably feasible to reduce or eliminate the discharge to surface waters. If it is demonstrated that it is not reasonably feasible to reduce or eliminate the discharge, then the Discharger must either (a) submit for approval by the Executive Officer a proposed plan and schedule that assures that selenium discharges in excess of those allowed pursuant to the effluent limitations will be offset on at least a one-to-one basis, or as determined by the Regional Water Board's Executive Officer; or, (b) demonstrate that the Discharger is a participating member of the Nitrogen and Selenium Management Program (NSMP) Working Group (see IV. Applicable Plans, Policies and Regulations, E. and F., below).

Any proposed selenium offset must assure that there is no net loading of selenium to surface waters within the San Diego Creek/Newport Bay watershed. Dischargers who pursue a selenium offset are required to identify a plan and schedule for implementation of the offset prior to commencing any new discharge, and are required to implement that plan and schedule upon approval by the Executive Officer. This plan/schedule is to reflect the shortest practicable time necessary to provide the offset. In no case shall this schedule extend beyond December 20, 2009. It is recognized that the offset may not be completed within the time frame of the actual discharge; therefore, in filing a Notice of Intent to obtain authorization to discharge under this Order, these Dischargers are required to acknowledge explicitly that no notice of termination will be issued and

that compliance with this Order will continue to be required and enforced until such time as the offset is satisfactorily completed.

5. An evaluation of the nitrogen concentrations in proposed discharges and a determination of whether immediate compliance with the numeric effluent limitations specified in this Order for surface water discharges of nitrogen is feasible. A description of how a 50% reduction in nutrient discharges will be achieved if nitrogen is present in the discharges. If it is demonstrated that it is not reasonably feasible to achieve immediate compliance with the 50% reduction, then the Discharger is required to (1) identify a proposed plan and schedule whereby the 50% reduction will be achieved within the shortest practicable time, or (2) identify a proposed plan and schedule for implementation of a nitrogen offset. The nitrogen offset program must (a) assure the reduction of nitrogen loading to surface waters equivalent to the requisite 50% reduction, (b) assure the completion of the offset in the shortest practicable time, and (c) be implemented upon approval by the Executive Officer. It is recognized that the offset may not be completed within the time frame of the actual discharge; therefore, in filing a Notice of Intent to obtain authorization to discharge under this Order, these Dischargers are required to acknowledge explicitly that no notice of termination will be issued and that compliance with this Order will continue to be required and enforced until such time as the offset is satisfactorily completed.
6. The Discharger shall submit for approval by the Executive Officer of the Regional Water Board a fixed hardness value based on the 5th percentile of effluent hardness measurements or the average ambient receiving water hardness measurements for those sites polluted with metals (lead, cadmium, copper, chromium (III), nickel, silver, and zinc).

### **III. GROUNDWATER MANAGEMENT ZONE AND WASTEWATER DESCRIPTION**

The groundwater management zone in the San Diego Creek/Newport Bay Watershed consists of a deep regional aquifer overlain by a shallow perched aquifer. The deep aquifer, an important component of the water supply for Orange County, is recharged naturally through infiltration along the flanks of the Santa Ana Mountains, and artificially through actively managed spreading basins along the Santa Ana River. The shallow aquifer is poorly transmissive, restricted in extent, and found largely in the central portion of the watershed in the Tustin Plain. Historically, this aquifer recharged through local vertical infiltration. Surface runoff in the watershed ponded seasonally in the area known as the Swamp of the Frogs, where shallow groundwater seeped to the surface.

The quality and hydrology of the shallow groundwater has been altered by anthropogenic activities, beginning in the early part of the 20th century. Irrigated agriculture resulted in leaching of nitrates and other salts to the shallow groundwater. The Swamp of the Frogs was drained and a network of channels was created to convey wastewater to Upper Newport Bay. A large portion of this wastewater consists of "baseflow" (seepage from shallow groundwater). Although seleniferous bedrock and soils occur naturally in parts of the watershed, the drainage modifications in the watershed have resulted in increased selenium mobility. The concentration of selenium in the groundwater of the watershed is

not homogeneous and can vary widely depending on specific location within the watershed. Accordingly, the concentration of selenium in groundwater-related discharges in the watershed also varies widely.

Recent investigations into the sources of selenium and nutrients in the watershed have found that approximately 62-87 percent (%) of the base flows in San Diego Creek result from groundwater inflows to the creek, either naturally through subsurface flow, springs, and weepholes, or through groundwater dewatering and remediation operations. Approximately 96% of the selenium and 85% of the nitrate concentrations found in San Diego Creek and its tributaries result from these groundwater inputs<sup>3</sup>.

Chlordane, 1,1,1-trichloro-2,2-bis(p-chlorophenyl)ethane (DDT), toxaphene and PCBs are legacy organochlorine compounds that are no longer being actively used in the watershed. However, these compounds are highly persistent in the environment and while they have been banned for a number of years, they continue to be found in sediments and to accumulate in biota in the watershed. Historic uses of the organochlorine pesticides (chlordane, DDT and toxaphene) were predominantly agricultural and urban. PCBs were used extensively for many years as insulating fluids in electrical transformers and in other products such as cutting oils. PCBs were released into the environment through discharges from point sources and through spills and accidental releases.

Organochlorine compounds bioaccumulate in the fatty tissues of biological organisms and have been associated with reproductive impacts (most notably, eggshell thinning in birds due to DDE, a degradation product of DDT). Though the organochlorine compounds have low water solubility (i.e., are hydrophobic) and are therefore most often associated with fine sediments and organic particulates, DDT has been detected in groundwater in the watershed at concentrations exceeding the CTR criteria<sup>4</sup>. TMDLs for these compounds have been promulgated by USEPA and revised organochlorine compounds TMDLs were recently adopted by the Regional Board<sup>5</sup>. The Regional Board-approved TMDLs will not become effective until approved by the State Water Board and the Office of Administrative Law. USEPA approval of the TMDLs is also required. USEPA has indicated its intent to approve the TMDLs once the state approval process is complete. To implement the organochlorine compounds TMDLs promulgated by the USEPA, this Order requires Dischargers to conduct monitoring of discharges and will include a reopener provision that will enable the Regional Board to reopen the permit to include effluent limitations and other relevant requirements, if monitoring data indicate that discharges have the reasonable potential to cause or contribute to violations of organochlorine compound standards and TMDLs. These limitations and requirements will implement the organochlorine compounds TMDLs adopted by the Regional Board.

---

<sup>3</sup> Meixner et al., 2004. *Sources of Selenium, Arsenic and Nutrients in the Newport Bay Watershed*. (Contract Report to the Santa Ana Regional Water Board)

<sup>4</sup> SARWQCB, 2006. *Total Maximum Daily Loads for Organochlorine Compounds, San Diego Creek, Upper and Lower Newport Bay, Orange County, California*. November 17, 2006 technical staff report.

<sup>5</sup> Resolution No. R8-2007-0024

Groundwater pollutant plumes often contain complex mixtures of hundreds of petroleum-related compounds (e.g., gasoline contains over 200 chemicals) or chlorinated hydrocarbons, which makes complete chemical analyses very expensive and sometimes impractical or impossible due to sample matrix interferences, constituent masking, or the lack of standard analytical techniques. Further, neither the State nor the USEPA<sup>6</sup> has proposed/established quality objectives for many of the petroleum hydrocarbon compounds. Therefore, indicator constituents for the detection and evaluation of complex mixtures of petroleum related compounds such as gasoline and diesel will be used in setting effluent limitations and monitoring groundwater discharged to surface waters in the Santa Ana Region<sup>7</sup>. The indicator constituents used for evaluating compliance for discharges of gasoline and diesel related products are benzene, toluene, ethylbenzene, xylene (BTEX) and total petroleum hydrocarbons. For chlorinated hydrocarbon solvents such as trichloroethylene (TCE) and tetrachloroethylene (PCE), the specific chemical constituents and/or their degradation products can be used to evaluate compliance with the permit limitations for these constituents specified in this Order.

Diesel fuel consists primarily of straight-chained hydrocarbons (alkenes and alkanes) ranging in length from C10 to C23, with C16 and C17 predominating. The C10-C23 straight-chain hydrocarbons in groundwater can be quantified using standard analytical techniques. Since the predominant components of diesel fuel are the straight-chain hydrocarbons, the California Department of Public Health's recommended analytical procedure for total petroleum hydrocarbons-diesel<sup>8</sup> is used to indicate groundwater polluted by diesel fuel.

To reduce the amount of carbon monoxide in the atmosphere and abate air pollution, oxygenated fuels were required by the USEPA in select metropolitan areas such as Southern California. Fuel oxygenates are also used to enhance the octane of conventional gasoline. Methyl tertiary-butyl ether (MTBE) has been the most commonly used fuel oxygenate. Oxygenates in limited commercial use also include ethyl tert-butyl ether (ETBE) and tert-amyl methyl ether (TAME), tert-butyl alcohol (TBA), methanol (MeOH), and diisopropyl ether (DIPE). Accidental releases of gasoline to the subsurface from underground storage tanks, pipelines, refueling facilities, and landfills provide point sources for entry of oxygenates into the hydrologic cycle, together with the gasoline hydrocarbons. MTBE, as well as other alkyl ether oxygenates, ETBE and TAME are much less biodegradable than BTEX hydrocarbons in ground water. Tert butyl alcohol (TBA) is also being detected in effluent streams and, like MTBE, poses a threat to water quality. Furthermore, the fuel oxygenates sorb only weakly to soil and aquifer material, thereby increasing the risk of groundwater contamination.

---

<sup>6</sup> *United States Environmental Protection Agency*

<sup>7</sup> *It is believed that fuels have been adequately studied to justify limiting the analysis to these compounds (see "Leaking Underground Storage Tank Manual: guidelines for Site Assessment, Cleanup, and Underground Storage Tank Closure," State of California, Leaking Underground Fuel Tank Task Force, May 1988).*

<sup>8</sup> *Leaking Underground Fuel Tank (LUFT) Manual: Guidelines for Site Assessment, Cleanup, and Underground Storage Tank Closure, October 1989.*

Recent findings indicate the presence of MTBE in over 60% of surface water supply reservoirs and groundwater water supply wells in California. Data from a Lawrence Livermore National Laboratory study show that MTBE has been detected at over 4,600 leaking underground tank sites. Consequently, on March 26, 1999, the Governor concluded that the use of MTBE in California gasoline poses a significant risk to California's environment, and directed that MTBE be phased out of California gasoline as soon as possible. The risks to California's environment prompted the California Department of Public Health (CDPH) to establish a maximum contaminant level for MTBE in drinking water of 13 micrograms per liter.

1,2-Dichloroethane was used as an anti-knock additive in leaded fuels. 1,2-Dichloroethane (1,2-DCA) is a colorless, oily, organic liquid with a sweet, chloroform-like odor. The greatest use of 1,2-dichloroethane is in making chemicals involved in plastics, rubber and synthetic textile fibers. Other uses include: as a solvent for resins and fats, photography, photocopying, cosmetics, drugs; and as a fumigant for grains and orchards (EPA fact sheet).

In the past, 1,2,3-Trichloropropane (TCP) has been used primarily as a solvent and extractive agent. As a solvent, it has commonly been used as a paint and varnish remover, a cleaning and degreasing agent and a cleaning and maintenance solvent. It can be removed through granular activated carbon.

Vinyl Chloride (chloroethene or chloroethylene) is also being detected at low concentrations at sites with chlorinated solvents release. Vinyl Chloride is normally the result of the breakdown of chlorinated solvents. Due to its significant toxicity and regular presence in the soils and groundwater at chlorinated solvents release sites, effluent limitations for vinyl chloride are specified in this Order.

1,4-dioxane is a man-made compound primarily used as an industrial solvent or solvent stabilizer. 1,4-dioxane is generally not biodegradable and is effectively treated through an advance oxidation process in the form of ultraviolet light combined with hydrogen peroxide. This treatment breaks down the compound largely into carbon dioxide and water.

Perchlorate is both a naturally occurring and man-made chemical. Perchlorate is the primary ingredient of solid rocket propellant. Perchlorate affects human health by interfering with the uptake of iodide into the thyroid gland and disrupts the function of the thyroid. Biological treatment and ion (anion) exchange systems are among the technologies that are being used to remove perchlorate from water.

This Order regulates discharges to Newport Bay and surface waters within the San Diego Creek/Newport Bay watershed from groundwater dewatering operations where contaminated groundwater may be extracted and discharged, and from temporary or permanent remediation systems, operated to clean up groundwater contamination from petroleum based products, solvents and metals. This Order combines the applicable requirements specified in Order No. R8-2004-0021 and Order No. R8-2007-0008.

## **A. Description of Wastewater Treatment**

A number of treatment methods are available for the treatment of groundwater contaminated by petroleum hydrocarbons or chlorinated solvents. The more commonly used methods include air stripping, air sparging, granular activated carbon adsorption, UV-peroxidation, nutrient enhanced biodegradation, and a combination of two or more of the above technologies. To remediate subsurface soil contamination, vapor extraction systems and in-situ bio-remediation are commonly used. Most of these systems, if designed and operated properly, can lower the concentrations of the pollutants to below accepted detection limits.

Technologies that are currently being used to remove perchlorate from water include biological treatment and ion (anion) exchange. Nitrate can be removed by a variety of treatment options and best management practices (BMPs) using de-nitrification techniques (e.g., nutrient-enhanced biological degradation, treatment wetlands). At this time, there are no reasonably feasible treatment technologies for removal of selenium, although certain technologies have been pilot tested by the Nitrogen and Selenium Management Program (NSMP) Working Group (see IV. Applicable Plans, Policies and Regulations, E., below) and the Irvine Ranch Water District and appear promising. Discharges of selenium to surface waters may be reduced through the implementation of BMPs designed to reduce or even eliminate the volume of water discharged to surface waters. Organochlorine compounds (DDT and its isomers) have been removed from groundwater using a groundwater extraction system with carbon adsorption treatment vessels.

## **B. Discharge Points and Receiving Waters**

This Order authorizes discharges to Newport Bay and surface waters within the San Diego Creek/Newport Bay watershed. The beneficial uses of these receiving waters are described in Section IV.C.1., below.

## **C. Summary of Requirements Specified in Order No. R8-2007-0008 and Order No. R8-2004-0021.**

Order No. R8-2007-0008 includes effluent limitations for MUN designated and MUN-excepted surface waters for Total Petroleum Hydrocarbons, Benzene, Toluene, Xylene, Ethylbenzene, Carbon Tetrachloride, Chloroform, Dichlorobromomethane, Methyl Ethyl Ketone, Methyl Isobutyl Ketone, Methyl Tertiary Butyl Ether (MTBE), Naphthalene, Tetrachloroethylene (PCE), Trichloroethylene (TCE), 1,1-Dichloroethane, 1,1-Dichloroethylene, 1,2-Dichloroethylene, cis-1,2-Dichloroethylene, trans-1,2-Dichloroethylene, 1,1,1-Trichloroethane (TCA), Tert Butyl Alcohol (TBA), 1,4-Dioxane, Perchlorate and lead. This Order includes effluent limitations and requirements of Order No. R8-2007-0008 that are applicable to surface waters that are excepted from MUN beneficial use.

Order No. R8-2004-0021 includes effluent limitations for selenium and nutrients for discharges of wastewater into the San Diego Creek/Newport Bay Watershed. This Order includes effluent limitations and requirements of Order No. R8-2004-0021 that are applicable to surface waters that are excepted from MUN beneficial use.

Newport Bay and all surface waters within the San Diego Creek/ Newport Bay watershed are excepted from the MUN beneficial use. Accordingly, this Order includes effluent limitations applicable to discharges to surface waters that are excepted from MUN beneficial use.

#### **D. Compliance Summary - Not Applicable**

#### **E. Planned Changes - Not Applicable**

### **IV. APPLICABLE PLANS, POLICIES, AND REGULATIONS**

The requirements contained in this Order are based on the requirements and authorities described in this section.

#### **A. Legal Authorities**

This Order is issued pursuant to section 402 of the federal Clean Water Act (CWA) and its implementing regulations adopted by the USEPA, and chapter 5.5, division 7 of the California Water Code (commencing with section 13370). It shall serve as an NPDES permit for the point source discharges described herein to Newport Bay and surface waters within the San Diego Creek/Newport Bay Watershed. This Order also serves as Waste Discharge Requirements (WDRs) pursuant to article 4, chapter 4, division 7 of the California Water Code (commencing with section 13260).

Pursuant to NPDES regulations at 40 CFR 122.28, States may request authority to issue general NPDES permits. On June 8, 1989, the State Water Board applied to the USEPA requesting revisions to its NPDES Program in accordance with 40 CFR 122.28, 123.62, and 403.10, including a request to add general permit authority to its approved NPDES Program. On September 22, 1989, the USEPA, Region 9, approved the State Water Board's request, granting authorization for the State to issue general NPDES permits.

Pursuant to NPDES regulations at 40 CFR 122.28 (a) (2) general permits may be regulate point source discharges that:

1. Involve the same or substantially similar types of operations,
2. Discharge the same types of wastes,
3. Require the same effluent limitations,
4. Require the same or similar monitoring, and
5. In the opinion of the Executive Officer, are more appropriately controlled under a general permit than under individual permits.

## **B. California Environmental Quality Act (CEQA)**

Under Water Code section 13389, this action to adopt an NPDES permit is exempt from the provisions of CEQA, Public Resources Code section 21000 et seq. (*County of Los Angeles v. California State Water Resources Control Board* (2006) 143 Cal.App.4th 985, mod. (Nov. 6, 2006, B184034) 50 Cal.Rptr.3d 619, 632-636.).

## **C. State and Federal Regulations, Policies, and Plans**

- 1. Water Quality Control Plans.** The Regional Water Board adopted a Water Quality Control Plan for the Santa Ana Basin (hereinafter Basin Plan) that became effective on January 24, 1995. The Basin Plan designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. In addition, State Water Resources Control Board (State Water Board) Resolution No. 88-63 (Sources of Drinking Water Policy) requires that, with certain exceptions, the Regional Water Board assign the municipal and domestic water supply use to water bodies.

On January 22, 2004, the Regional Water Board adopted Resolution No. R8-2004-0001, amending the Basin Plan to incorporate revised boundaries for groundwater subbasins, now termed “management zones”, new nitrate-nitrogen and TDS objectives for the new management zones, and new nitrogen and TDS management strategies applicable to both surface and ground waters. The State Water Resources Control Board and Office of Administrative Law (OAL) approved the N/TDS Amendment on September 30, 2004 and December 23, 2004, respectively. EPA approved the surface water standards components of the N/TDS Amendment on June 20, 2007.

The existing and potential beneficial uses of Newport Bay and San Diego Creek include:

- a. Navigation,
- b. Water Contact Recreation,
- c. Non-contact Water Recreation,
- d. Commercial and Sportfishing,
- e. Preservation of Biological Habitats of Special Significance,
- f. Wildlife Habitat,
- g. Rare, Threatened or Endangered Species,
- h. Spawning, Reproduction, and Development,
- i. Marine Habitat,
- j. Shellfish Harvesting,
- k. Estuarine Habitat,
- l. Warm Freshwater Habitat, and
- m. Groundwater Recharge (intermittent beneficial use).

Many surface waters within the region recharge underlying groundwater basins. The existing and potential beneficial uses of groundwater within the Newport Bay/San Diego Creek Watershed include:

- a. Municipal and Domestic Supply,
- b. Agricultural Supply,
- c. Industrial Service Supply, and
- d. Industrial Process Supply.

The State Water Board adopted a Water Quality Control Plan for Control of Temperature in the Coastal and Interstate Water and Enclosed Bays and Estuaries of California (the Thermal Plan) on May 18, 1972, and amended this plan on September 18, 1975. This plan contains temperature objectives for surface waters of the State.

This Order implements applicable provisions of the Basin Plan and the Thermal Plan, as well as the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (State Implementation Policy or SIP)(see 3., below).

2. **National Toxics Rule (NTR) and California Toxics Rule (CTR).** USEPA adopted the NTR on December 22, 1992, and later amended it on May 4, 1995, and November 9, 1999. Approximately forty water quality criteria in the NTR applied in California. On May 18, 2000, USEPA adopted the CTR, which established new criteria for toxics in the State and incorporated the previously adopted criteria of the NTR. The CTR was amended on February 13, 2001. These rules contain water quality criteria for priority toxic pollutants applicable to inland surface waters, enclosed bays, and estuaries of the State.
3. **State Implementation Policy.** On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP became effective on April 28, 2000, with respect to the priority pollutant criteria promulgated for California by the USEPA through the NTR and to the priority pollutant objectives established by the Regional Water Board in the Basin Plan. The SIP became effective on May 18, 2000, with respect to the priority pollutant criteria promulgated by the USEPA through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for toxicity control. Requirements of this Order implement the SIP.

- 4. Alaska Rule.** On March 30, 2000, at 40 CFR 131.32, USEPA revised its regulation that specifies when new and revised state and tribal water quality standards become effective for CWA purposes. [65 Fed. Reg. 24641 (April 27, 2000)] Under the revised regulation (also known as the Alaska Rule), new and revised standards submitted to USEPA after May 30, 2000 must be approved by USEPA before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA before May 30, 2000 may be used for CWA purposes, whether or not approved by USEPA.
- 5. Antidegradation Policy.** NPDES regulations require that State water quality standards include an antidegradation policy consistent with the federal policy established at 40 CFR 131.12. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16, which incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The Basin Plan implements and incorporates by reference both the state and federal antidegradation policies. The discharges authorized under this Order are consistent with applicable antidegradation provisions of NPDES regulations at 40 CFR 131.12 and with State Water Board Resolution No. 68-16.
- 6. Anti-Backsliding Requirements.** CWA Sections 402 (o) (2) and 303 (d) (4) and NPDES regulations at 40 CFR 122.44 (l) prohibit backsliding in NPDES permits; i.e., effluent limitations in a reissued permit must be at least as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. This Order/General Permit is consistent with applicable anti-backsliding requirements. The limitations in this Order are not less stringent than those in the prior Orders/General Permits.

#### **D. Impaired Water Bodies on CWA 303(d) List**

Section 303(d) of the CWA requires states to identify water bodies where water quality standards are not expected to be met after technology-based effluent limitations have been implemented for point sources. For all 303(d)-listed water bodies and pollutants, the Regional Water Board has developed and/or plans to develop total maximum daily loads (TMDLs) that specify waste load allocations (WLA) for point sources and load allocations (LA) for non-point sources. These allocations form the basis, in part, for limitations in waste discharge requirements.

In June 2007, the USEPA approved the State's 2004-2006-303(d) list of impaired water bodies. This list included Reaches 1 and 2 of San Diego Creek and Upper and Lower Newport Bay. One or more of these water bodies were determined to be impaired by one or more of the following: fecal coliform, nutrients, metals, pesticides (including organochlorine pesticides), PCBs and selenium. TMDLs have been developed to address these impairments. Section D describes the requirements of the nutrient TMDL, section E describes the requirements of the selenium TMDL, and section F describes the requirements of the organochlorine compounds TMDLs, which are relevant to this Order.

## E. Nutrient TMDL.

On April 17, 1998, the Regional Water Board adopted Resolution No. 98-9, amending the Basin Plan to incorporate a Nutrient Total Maximum Daily Load (TMDL) for the Newport Bay/San Diego Creek Watershed. The TMDL was amended by Resolution No. 98-100 on October 9, 1998 and thereafter approved by the State Water Resources Control Board, Office of Administrative Law and the USEPA. The nutrient TMDL was developed to address aesthetic and recreational nuisances created by algal blooms in Newport Bay, as well as the concern that these blooms may adversely affect wildlife. The TMDL establishes final targets that are based on a 50% reduction in nitrogen loading. The TMDL requires that the 50% reduction be achieved no later than December 31, 2007 for summer loading (between April 1 and September 30); the 50% reduction in winter inputs (between October 1 and March 31) is to be achieved no later than December 31, 2012. While the TMDL requires reductions in nutrient loadings, it is recognized that too few nutrients in a waterbody can potentially adversely affect wildlife.

Consistent with the TMDL targets, the nutrient TMDL specifies wasteload and load allocations for total nitrogen mass inputs to the San Diego Creek/Newport Bay watershed from identified sources<sup>9</sup>. Nitrogen load allocations are specified for “undefined sources”, which include rising groundwater, discharges associated with groundwater cleanup and dewatering, atmospheric deposition, open space inputs and in-bay sediment nitrogen. Again consistent with the TMDL targets, the load allocations for undefined sources require a 50% reduction in summer inputs by 2007, and a 50% reduction in winter inputs by 2012.

For the 2006 summer season, the measured total nitrogen (TN) load into Newport Bay was about 141,000 lbs. This is slightly below the summer 2007 TMDL target of 153,861 lbs, but does not include in-bay nutrient supply from sediment. Research conducted by the Southern California Coastal Research Project (SCCWRP) has shown that the flux of nutrients from sediments in Newport Bay is significant, and of the same order-of-magnitude as the loading from the watershed.

TN loads contributed by groundwater dewatering and cleanup discharges amounted to 26,309 lbs (24,438 and 1,871 lbs, respectively). The 50% reduction for the dewatering loads regulated under Order No. R8-2004-0021<sup>10</sup> is provided by an offset from the Irvine Ranch Water District (IRWD) constructed wetlands in the San Joaquin Freshwater Marsh. Denitrification in the IRWD wetlands removed 33,447 lbs of nitrogen from San Diego Creek during summer 2006. Discharges not covered by the wetlands offset must either implement a 50% reduction or cease discharging to surface water.

---

<sup>9</sup> The TMDL assigns phosphorus load allocations to open space and agricultural areas. No phosphorus load allocations are specified for groundwater-related discharges since these discharges are not expected to include phosphorus.

<sup>10</sup> Order No. R8-2004-0021 regulates short-term groundwater-related discharges, including dewatering discharges. Short-term discharges are defined as those lasting one year or less.

An estimate of the nitrogen loads that would be regulated by this Order is approximately 25,000 lbs. (Discharges from MCAS<sup>11</sup> Tustin – about 1,800 lbs/season – are proposed to be routed out of the watershed via a sewer link to the Orange County Sanitation District (OCSD)). This estimate would fluctuate depending on the number of temporary dewatering operations that are active.

The nutrient TMDL is currently being reviewed and new water quality objectives for San Diego Creek will be proposed in 2008. The revised TMDL and new water quality objectives would likely require further reductions in nitrogen loads from groundwater dewatering and cleanup operations. This Order will be re-opened as necessary to address relevant requirements of the revised TMDL.

The Nutrient TMDL implementation plan supports the trading of pollutant allocations, where appropriate, as a potentially cost-effective method to achieve pollutant reduction. There is an ongoing effort by watershed stakeholders to design and implement a regional program to achieve the nitrogen reductions required by the TMDL (natural treatment systems). Implementation of this program, with participation by the groundwater Dischargers, will likely enable the Dischargers to achieve the requisite nitrogen mass reductions to Newport Bay, particularly when coupled with nitrogen removal accomplished by IRWD's constructed wetlands.

On December 20, 2004, the Regional Water Board adopted Order No. R8-2004-0021, NPDES No. CAG998002, to regulate short-term groundwater-related discharges and de minimus wastewater discharges to surface waters within the San Diego Creek/Newport Bay Watershed. This Order was adopted, in part, to assure that discharges of nitrogen (and selenium) were regulated appropriately to implement the nutrient (and selenium) TMDLs. Certain of the short-term and long-term Dischargers of groundwater-related wastewaters within the watershed have agreed to form a Nitrogen and Selenium Management Program Working Group (NSMP Working Group, or Working Group) to address the requirements of this Order. The Working Group has committed to fund and participate in a Work Plan. The tasks include the development of a nutrient offset, trading or mitigation program that is to be based on a comprehensive understanding of the groundwater-related nutrient inputs to surface waters in the Newport Bay watershed.

Completion of the approved Work Plan is expected to result in the development of a comprehensive management plan for nitrogen (selenium see discussion below) in groundwater-related inflows to surface waters in the Newport Bay watershed and as such, goes beyond issues specific to the discharges regulated under this Order. The management plans are expected to provide recommendations for specific load and wasteload allocations for the groundwater-related components of the "undefined source" category identified in the TMDL, in addition to offset, trading or mitigation program recommendations. Revisions to the TMDL and/or to the nutrient-related requirements in this Order may be necessary based on the results of the Work Plan assessments and resultant management plans.

---

<sup>11</sup> MCAS = Marine Corps Air Station

This Order implements relevant requirements of the Nutrient TMDL. To implement the nutrient TMDL, this Order includes a total nitrogen effluent limit of 1 mg/L for groundwater dewatering discharges to San Diego Creek, which is tributary to Newport Bay. Dischargers may comply with this requirement by implementing a nitrogen offset program, such as participation in the diversion and treatment of San Diego Creek flows in the IRWD constructed wetlands in the San Joaquin Freshwater Marsh or in the implementation of the Natural Treatment System (NTS), and/or by implementing other nitrogen management strategies identified through the NSMP.

## **F. Selenium TMDLs**

On June 14, 2002, the USEPA Region 9 established TMDLs for 14 toxic pollutants, including selenium, for San Diego Creek and Newport Bay. The selenium TMDLs are based on the selenium criteria specified in the CTR and in the NTR. The EPA TMDLs for selenium identified loading targets for specific groups of discharges but recognized that quantification of the baseline loading from Dischargers of groundwater was infeasible due to the lack of selenium data. The EPA TMDLs do not include specific implementation requirements, such as compliance timeframes, interim numeric targets, etc, since implementation plans are the responsibility of the Regional Water Board. However, pursuant to federal regulations, the Regional Water Board is required to ensure that NPDES permits for discharges in this watershed contain effluent limitations necessary to be consistent with the wasteload allocations specified in the selenium TMDLs (and other TMDLs). In the absence of an adopted implementation plan, the Regional Water Board can and must employ its legally authorized discretion in determining the appropriate permit provisions to implement these allocations. Regional Water Board staff is now working on an implementation plan for the selenium TMDLs, which will be considered for future adoption as a Basin Plan amendment. Staff may also recommend revisions to the selenium TMDLs established by EPA based on ongoing and forthcoming studies by EPA, Board staff and others. In its documents establishing the toxic TMDLs, EPA recognizes the substantial uncertainties that remain concerning selenium sources, biological effects, and the appropriate numeric objective that should apply to the protection of beneficial uses. EPA is now engaged in a review of the selenium objective in the CTR. Resolution of these uncertainties, and possible revision of the numeric selenium objective by EPA or through a site-specific objective process, is likely to require future refinement of the selenium TMDL. Any such refinement would necessitate review and revision, as appropriate, of this Order. The lack of a readily available, practicable selenium treatment technology that can assure compliance with selenium discharge limitations is also recognized. Absent identification of effective and reasonable treatment technologies, source controls or pollution reduction measures for selenium, development of a site-specific objective for selenium in the Newport Bay watershed will be appropriate.

In response to the selenium-related requirements of Order No. R8-2004-0021 and to the acknowledged difficulty of achieving compliance with selenium effluent limitations because of the lack of a practicable selenium treatment technology, the Work Plan developed by the NSMP Working Group (see discussion in E. Nutrient TMDL, above) includes the development of a selenium site-specific objective, evaluation of potential selenium treatment technologies and BMPs, and an offset, trading or mitigation program that is to be based on a comprehensive understanding of the groundwater-related selenium inputs to surface waters in the Newport Bay watershed.

Completion of the approved Work Plan is expected to result in the development of a comprehensive management plan for selenium in groundwater and surface waters in the Newport Bay watershed and as such, goes beyond issues specific to the discharges regulated under this Order. Revisions to the TMDLs and/or to the selenium-related requirements in this Order may be necessary based on the results of the Work Plan assessments, resultant management plans, and the adoption of site-specific selenium objectives.

Both the CTR and the State Policy include provisions for compliance schedules for effluent limitations for selenium and other priority pollutants. Pursuant to the State Policy, up to five years from the date of adoption of waste discharge requirements that implement the CTR criteria may be allowed to complete actions necessary to comply with CTR-criterion-based effluent limitations. These actions include the development and adoption of a site-specific objective, if appropriate, as provided in the Policy (Section 5.2). If the compliance schedule exceeds one year, interim limitations must be specified in NPDES permits and interim requirements to control the pollutant for which the compliance schedule is included may be imposed. These interim requirements may include pollutant minimization and source control measures. This Order requires that the Dischargers meet the selenium final limit by December 20, 2009. This is the same compliance date specified for Dischargers regulated under the General Permit Order No. R8-2004-0021 and the City of Irvine's long-term groundwater-related discharges regulated under Order No. R8-2005-0079, NPDES No. CA8000406.

This Order implements relevant provisions of the CTR, the EPA selenium TMDLs for San Diego Creek and Newport Bay, and the SIP by specifying interim performance-based and final numeric effluent limitations for selenium for the treated groundwater discharges. The Dischargers must implement selenium reduction through reasonable treatment, source control, or pollution prevention measures when such measures become available during the five-year permit term. This Order requires that if a practicable selenium treatment technology becomes available, the Discharger shall implement that technology and comply with the final selenium limits in this Order within one year of notification of the need to do so by the Regional Board. In addition, the Dischargers may be able to reduce or eliminate selenium concentrations and mass discharges by the implementation of low technology best management practices (BMPs). Such volume-reduction and other BMPs will be investigated in an aggressive manner, including an evaluation of other potential positive and negative impacts that may result from the BMPs.

## G. Organochlorine Compounds TMDLs

On June 14, 2002, USEPA Region 9 established TMDLs for 14 toxic pollutants, including five organochlorine compounds, for San Diego Creek, Upper and Lower Newport Bay, and Rhine Channel. The organochlorine (OC) compounds included four legacy pesticides (1,1,1-trichloro-2,2-bis(p-chlorophenyl)ethane [DDT], chlordane, dieldrin and toxaphene) and polychlorinated biphenyls (PCBs). TMDLs were established for chlordane, total DDT, and total PCBs in all these waterbodies; dieldrin TMDLs were established for San Diego Creek, Lower Newport Bay, and Rhine Channel; and a TMDL for toxaphene was established only for San Diego Creek (USEPA, 2002).

In September 2004, the Water Quality Control Policy for Developing California's Clean Water Act Section 303(d) List (2004) (the State Listing Policy) was adopted. Impairment due to the organochlorine compounds in Newport Bay and San Diego Creek was reevaluated in accordance with this new Policy. The results of this impairment assessment differed from that previously performed by USEPA in that the water body-pollutant combinations requiring TMDLs were revised, consistent with the new findings of impairment. The loading capacities and existing loads were also revised to reflect corrections and modifications to the USEPA technical TMDLs.

On September 7, 2007, the Regional Board adopted a Basin Plan amendment to incorporate TMDLs for total DDT and toxaphene in San Diego Creek and total DDT, chlordane and total PCBs for Upper and Lower Newport Bay. Informational TMDLs were also adopted for chlordane and total PCBs in San Diego Creek. EPA has indicated support for these revised TMDLs; therefore, the stakeholders and Regional Board staff are moving forward with implementation of the revised organochlorine compounds TMDLs in accordance with the September 7, 2007 Basin Plan Amendment.

The organochlorine compounds TMDLs include numeric targets based on the CTR ambient water quality criteria. The CTR states that it is inappropriate to adjust to percent dissolved for bioaccumulative compounds such as organochlorine pesticides and PCBs even though these compounds have low water solubility. Organochlorine pollutants tend to tightly sorb to soil organic matter; however, they have been detected in both soil and groundwater<sup>12</sup>—DDT has been detected in groundwater in at least one location in the watershed. As these compounds are highly persistent in the environment, over very long periods of time they may eventually leach into groundwater, especially in soils that contain little organic matter.

Given the absence of relevant data with which to determine reasonable potential pursuant to the SIP, this Order requires monitoring for organochlorine compounds but does not include effluent limitations. The results of the monitoring will be used to determine whether it is appropriate to reopen the Order to specify effluent limitations consistent with the organochlorine compounds TMDLs.

<sup>12</sup>

## **H. Other Plans, Policies and Regulations**

In most areas of the watershed, there is no significant amount of receiving water at the point of discharge. Therefore, no mixing zone allowance is included in the calculation of effluent limits. Consequently, compliance with the effluent limits is required to be determined at the end of the discharge pipe or at a location prior to where the discharge enters the receiving water.

## **V. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS**

The CWA requires point source Dischargers to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations in the Code of Federal Regulations: section 122.44(a) requires that permits include applicable technology-based limitations and standards; and section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, WQBELs may be established: (1) using USEPA criteria guidance under CWA section 304 (a), supplemented where necessary by other relevant information; (2) on an indicator parameter for the pollutant of concern; or (3) using a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in 40 CFR 122.44(d)(1)(vi).

### **A. Discharge Prohibitions**

The discharge prohibitions are based on the Federal Clean Water Act, Basin Plan, State Water Resources Control Board's plans and policies, U.S. Environmental Protection Agency guidance and regulations, and previous permits Orders No. R8-2004-0021 and R8-2007-0008 provisions, and are consistent with the requirements set for other discharges regulated by NPDES permits adopted by the Regional Water Board.

### **B. Technology-Based Effluent Limitations**

#### **1. Scope and Authority**

CWA Section 301 (b) and NPDES regulations at 40 CFR 122.44 require permits to, at a minimum, meet applicable technology-based requirements and any more stringent effluent limitations necessary to meet applicable water quality standards. The CWA requires the USEPA to develop effluent limitations, guidelines and standards (Effluent Limitations Guidelines - ELGs) representing application of best practicable treatment control technology (BPT), best available technology economically achievable (BAT), best conventional pollutant control technology (BCT), and best available demonstrated control technology for new sources (NSPS),

for specific industrial categories. Where USEPA has not yet developed ELGs for a particular industry or a particular pollutant, Section 402 (a) (1) of the CWA and USEPA regulations at 40 CFR 125.3 authorize the use of best professional judgment (BPJ) to derive technology-based effluent limitations on a case-by-case basis. When BPJ is used, the permit writer must consider specific factors outlined at 40 CFR 125.3.

## **2. Applicable Technology-Based Effluent Limitations**

### **a. Petroleum and Chlorinated Hydrocarbons**

Effluent limitations guidelines for petroleum and chlorinated hydrocarbons have not been developed for the category of Dischargers authorized to discharge by this Order. However, since authorized Dischargers are discharging treated wastewaters, it is appropriate to establish technology-based effluent limitations using Best Professional Judgment (BPJ). This Order establishes technology-based effluent limitations.

- b. 1,2,3-trichloropropane (TCP) is a chemical of concern. The current technology that is used to remove TCP from discharges has successfully reduced concentration of TCP below the detection limit of 0.5 µg/L. This is the basis for the effluent limitation for TCP in this Order.

## **C. Water Quality-Based Effluent Limitations (WQBELs)**

### **1. Scope and Authority**

Section 301(b) of the CWA and section 122.44(d) require that permits include limitations more stringent than applicable federal technology-based requirements where necessary to achieve applicable water quality standards.

Section 122.44(d)(1)(i) mandates that permits include effluent limitations for all pollutants that are or may be discharged at levels that have the reasonable potential to cause or contribute to an exceedance of a water quality standard, including numeric and narrative objectives within a standard. Where reasonable potential has been established for a pollutant, but there is no numeric criterion or objective for the pollutant, water quality-based effluent limitations (WQBELs) must be established using: (1) USEPA criteria guidance under CWA section 304(a), supplemented where necessary by other relevant information; (2) an indicator parameter for the pollutant of concern; or (3) a calculated numeric water quality criterion, such as a proposed state criterion or policy interpreting the state's narrative criterion, supplemented with other relevant information, as provided in section 122.44(d)(1)(vi).

The process for determining reasonable potential and calculating WQBELs when necessary is intended to protect the designated uses of the receiving water as specified in the Basin Plan, and achieve applicable water quality objectives and criteria that are contained in other state plans and policies, or any applicable water quality criteria contained in the CTR and NTR.

## 2. Applicable Beneficial Uses and Water Quality Criteria and Objectives

This Order authorizes certain discharges to surface waters within the San Diego Creek/Newport Bay Watershed. Beneficial uses of these receiving waters, as designated by the Basin Plan are described in Section IV.C.1., above. The water quality criteria applicable to these receiving waters are established by the NTR, CTR, and Basin Plan.

- a. The Basin Plan includes the following narrative and numeric water quality objectives applicable to surface waters.

TDS: TDS limitations are specified in this Order for discharges to surface waters. The proposed TDS limits for direct discharges into surface waters within the San Diego Creek/Newport Bay watershed are based on the objectives specified in Table 4-1 of the amended Basin Plan and are shown in Table below:

**Table 1. TDS Water Quality Objectives of Surface Water**

| Inland Surface Waters    | TDS, mg/L |
|--------------------------|-----------|
| Reach 1, San Diego Creek | 1500      |
| Reach 2, San Diego Creek | 720       |

TIN. As discussed in Section III.D., above, the nutrient TMDL specifies wasteload and load allocations for total nitrogen mass inputs to the San Diego Creek/Newport Bay watershed from identified sources<sup>13</sup>. Nitrogen load allocations are specified for “undefined sources”, which include rising groundwater, discharges associated with groundwater cleanup and dewatering, atmospheric deposition, open space inputs and in-bay sediment nitrogen. The load allocations for undefined sources require a 50% reduction in summer nitrogen inputs by 2007, and a 50% reduction in winter nitrogen inputs by 2012.

13

*The TMDL assigns phosphorus load allocations to open space and agricultural areas. No phosphorus load allocations are specified for groundwater-related discharges since these discharges are not expected to include phosphorus.*

- b. Unless specified in sections V.A.3. and V.A.4. of the Order, for discharges to surface waters where discharges percolate into the ground and there is no surface water quality objective, the effluent TDS/TIN concentration limit in the Order is based on the groundwater water quality objective for Irvine Groundwater Management Zone, as shown in Table 2, below:

**Table 2. TDS/TIN Water Quality Objectives of GMZ**

| Groundwater Management Zone | TDS, mg/L | TIN, mg/L |
|-----------------------------|-----------|-----------|
| Irvine                      | 910       | 7.9       |

However, treated effluent exceeding the groundwater management zone water quality objectives may be returned to the same management zone from which it was extracted without reduction of the TDS or TIN concentrations so long as the concentrations of those constituents are no greater than when the groundwater was first extracted. Incidental increases in the TDS and TIN concentrations (such as may occur during air stripping) of treated effluent will not be considered increases for the purposes of determining compliance with this discharge specification.

- c. CTR and SIP

The California Toxics Rule (CTR) and State Implementation Policy specify numeric objectives for toxic substances and the procedures whereby these objectives are to be implemented. The procedures include those used to conduct reasonable potential analysis to determine the need for effluent limitations for priority and non-priority pollutants.

The CTR specifies numeric aquatic life criteria for 23 priority toxic pollutants and numeric human health criteria for 57 priority toxic pollutants. These criteria apply to inland surface waters and enclosed bays and estuaries within the Santa Ana Region.

Selenium. As discussed in Section IV.F. above, USEPA Region 9 established total maximum daily loads (TMDLs) for selenium for San Diego Creek and Newport Bay on July 14, 2002. The selenium TMDLs are based on the selenium criteria specified in the CTR and in the NTR.

Effluent Limits for Carbon Tetrachloride, Dichlorobromomethane, Tetrachloroethylene, Trichloroethylene and 1,1-Dichloroethylene are based on the CTR Human Health values.

**b. Maximum Contaminant Levels**

The limits for benzene, methyl tertiary butyl ether (MTBE), cis-1,2-dichloroethylene, 1,2 dichloroethane, vinyl chloride and trans-1,2-dichloroethylene, are based on CDPH Maximum Contaminant Levels (MCLs).

**3. Determining the Need for WQBELs**

NPDES regulations at 40 CFR 122.44(d)(1)(i) require permits to include WQBELs for all pollutants (non-priority or priority) “which the Director determines are or may be discharged at a level which will cause, have the reasonable potential to cause, or contribute to an excursion above any narrative or numeric criteria within a State water quality standard” (have Reasonable Potential). Thus, assessing whether a pollutant has Reasonable Potential is the fundamental step in determining whether or not a WQBEL is required.

**4. WQBEL Calculations**

Discharge limitations for metals are also included in this Order. For discharges to fresh water and enclosed bays and estuaries, the limits are based on the California Toxics Rule metals objectives. For freshwater, certain metal objectives are equations in which hardness is the variable. The actual numeric value of the objectives is calculated using hardness measurements. To determine the effluent limitation for a specific metal constituent for each freshwater discharge, and to facilitate the determination of compliance, a fixed effluent hardness value will be used in the objective equations. Federal regulations require that the effluent limits for metals be expressed as the total recoverable form. To comply with this requirement, the dissolved criteria are translated into total recoverable effluent limits using ratios of the total recoverable metals to dissolved metals (t/d) concentrations. The State Implementation Policy stipulates that in the absence of site-specific information, the conversion factors cited in the CTR should be used as the t/d translators. This Order includes a tabulation of calculated effluent limits for metals corresponding to fixed hardness values (20 through 400 milligrams per liter) (see Attachment “B”). The calculations for arriving at the effluent limits for metals are in the Regional Water Board's file for this general permit. At sites polluted with metal constituents, the Discharger is required to submit hardness values for the discharge that will be used in determining the appropriate numeric limit for that specific metal constituent(s) in the discharge. The fixed hardness value, which shall be based on the 5th percentile of effluent hardness measurements or the ambient receiving water hardness measurements (whichever is more restrictive), shall be determined and submitted for approval by the Executive Officer of the Regional Water Board. Upon approval of the hardness value for the discharge, the effluent limit for metals discharges to freshwater bodies is determined from the table. For direct discharge to the Newport Bay, salt water criteria apply and are used as the basis for calculating effluent limitations.

Step 6 of the permit limit calculation procedure specified in the SIP stipulates that the average monthly effluent limitation is set equal to the effluent concentration allowance<sup>14</sup>. Where there is no mixing zone allowance and a California Toxics Rule human health objective applies, the effluent concentration allowance is equal to the applicable human health objective. Therefore, in these circumstances, the average monthly limit (AML) is equal to the human health objective. The SIP stipulates that where receiving waters are designated with the municipal water supply beneficial use (MUN), the human health objective for the consumption of water and organisms applies in calculating the effluent limitation; where the water is excepted from MUN, the human health objective for the consumption of organisms only applies. This Order includes effluent limits for discharges to receiving waters that are not designated MUN since all identified surface waters in the San Diego Creek/Newport Bay Watershed are excepted from the MUN beneficial use. For discharges to receiving waters, the AMLs were taken either from the California Toxics Rule human health objectives for the consumption of organisms only or from the CDPH's MCL. Each AML effluent limitation was multiplied by a 2.01 factor to determine the maximum daily concentration effluent limit. This factor is the average monthly effluent limit multiplier taken from Table 2 of the Policy. The multiplier corresponds to a coefficient of variation of 0.6 and number of samples equal to 4. This Order includes average monthly limit and maximum daily limits as required by federal regulations and the State Implementation Policy.

No mixing zone allowance is included in the calculation of effluent limits in this Order and, consequently, compliance with the effluent limits is required to be determined at the end of the discharge pipe for freshwater discharge. If a Discharger requests that a mixing zone allowance be included in the determination of appropriate effluent limits, a dilution model must be provided for approval.

Table 3 below shows the calculations for deriving effluent limitations for metals that are not hardness dependent, including other constituents for freshwater discharges. Effluent limitations for hardness dependent metals for freshwater discharges are tabulated in Attachment B of the Order. Table 4 below, shows the calculations for deriving effluent limitations for metals for saltwater discharges. Table 5 below shows the basis and calculations for effluent limitations for volatile organic compounds and other constituents.

14

*The EFFLUENT CONCENTRATION ALLOWANCE (ECA) is a value derived from the water quality objective, dilution credit, and ambient background concentration that is used, in conjunction with the coefficient of variation for the effluent monitoring data, to calculate a long-term average (LTA) discharge concentration. The ECA has the same meaning as waste load allocation (WLA) as used in USEPA guidance (Technical Support Document For Water Quality-based Toxics Control, March 1991, second printing, EPA/505/2-90-001).*

## **5. Whole Effluent Toxicity (WET)**

This Order does not specify numeric WET limits. However, this Order requires that the discharge shall not result in acute toxicity in ambient receiving waters. The effluent is deemed to cause acute toxicity when the toxicity test of 100% effluent as required in monitoring and reporting program, results in failure of the test as determined using the pass or fail test protocol specified in Methods for Measuring the Acute Toxicity of Effluents to Freshwater and Marine Organisms (EPA/821-R-02-012, October 2002).

### **D. Best Professional Judgment-Based Effluent Limitations**

The applicable limits for total petroleum hydrocarbons, toluene, ethylbenzene, xylenes, chloroform, 1,2-Dichloroethylene and naphthalene are carried over from Order No. R8-2007-0008 and are based on Best Professional Judgment (BPJ).

Since 1991, the same effluent limits for 1,2-Dichloroethylene have been included in permits regulating these discharges. However in 2003, effluent limitations for the two isomers (Cis and Trans) that make up 1,2-Dichloroethylene were added. To avoid triggering the antibacksliding provisions of the federal regulations, the effluent limitations for 1,2-Dichloroethylene are retained, with the specific condition that the sum of the isomers Cis 1,2-Dichloroethylene and trans 1,2-Dichloroethylene shall not exceed the effluent limitations for 1,2-Dichloroethylene.

This Order specifies limits for methyl isobutyl ketone(MIBK), Tert Butyl Alcohol (TBA), 1,4-dioxane, perchlorate and methyl ethyl ketone (MEK) that are the same as those specified in Order No. R8-2007-0008 and were based on notification levels identified by the California Department of Public Health/Office of Environmental Health Hazard Assessment (OEHHA). (In the case of MEK, the notification level is for methyl isobutyl ketone (MIBK), which is in the same class of liquid organic compounds as MEK).

### **D. Discharge Specifications**

Discharge limitations are included in this Order for those other chemicals of concern that typically pollute groundwater at service stations and similar sites within the San Diego Creek/Newport Bay watershed. In addition, the monitoring program includes analyses for additional constituents to determine the overall impact of individual discharges and to screen for unexpected chemicals.

Discharge Limitations established by this Order require authorized Dischargers to compare effluent data, generated through routine monitoring, to effluent limitations. Exceedance of any of the specified effluent limitations may trigger mandatory minimum penalties, accelerated monitoring for certain constituents and may lead to discontinuance of coverage under this General Permit. The Discharge Specifications impose specific effluent limitations, assuring that authorized discharges are not creating adverse impacts

on receiving water quality. When adverse impacts are highlighted following exceedance of an effluent limitation(s), Dischargers are directed to confirm the findings, to mitigate impacts, to sewer or stop the discharge and/or to seek coverage under an individual NPDES permit.

## **E. Final Effluent Limitations**

### **1. Satisfaction of Anti-Backsliding Requirements**

All effluent limitations in this Order are at least as stringent as the effluent limitations in Orders No. R8-2007-0008 and R8-2004-0021. See also D, above.

### **2. Satisfaction of Antidegradation Policy**

Discharges in conformance with the requirements of this Order will not result in a lowering of water quality and therefore conform to antidegradation requirements specified in Resolution No. 68-16, which incorporates the federal antidegradation policy at 40 CFR 131.12 where, as here, it is applicable.

### **3. Stringency of Requirements for Individual Pollutants**

Water quality-based effluent limitations have been scientifically derived to implement water quality objectives that protect beneficial uses. Both the beneficial uses and the water quality objectives have been approved pursuant to federal law and are the applicable federal water quality standards. To the extent that toxic pollutant water quality-based effluent limitations were derived from the CTR, the CTR is the applicable standard pursuant to 40 CFR Section 131.38. The scientific procedures for calculating the individual water quality-based effluent limitations for priority pollutants are based on the CTR-SIP, which was approved by USEPA on May 18, 2000. Apart from certain standards changes resulting from the N/TDS Basin Plan amendment, all beneficial uses and water quality objectives contained in the Basin Plan were approved under state law and submitted to and approved by USEPA prior to May 30, 2000. Any water quality objectives and beneficial uses submitted to USEPA prior to May 30, 2000, but not approved by USEPA before that date, are nonetheless “applicable water quality standards for purposes of the CWA” pursuant to section 131.21(c)(1). Collectively, this Order’s restrictions on individual pollutants are no more stringent than required to implement the requirements of the CWA.

### **4. Basis and Summary of Final Effluent Limitations for VOC Compounds and other Organics. The following Table 5 shows the basis for effluent limitations. (See also Tables 1, 2, 3 and 4 above)**

**Table 5. Limitations Applicable to Discharges into Receiving Waters - Not Designated as MUN**

| Constituent                               | Current Limitations                      |   | Basis of Limitations |             |            |                                  |                             |
|---|--|---|----------------------|-------------|------------|----------------------------------|-----------------------------|
|   | Maximum Daily Concentration Limit (µg/L) | Average Monthly Concentration Limit, (µg/L) | MCL (µg/L)           | CTR, (µg/L) |            |                                  |                             |
|   |  |   |                      | Fresh Water | Salt water | Human Health Water and Organisms | Human Health Organisms only |

\*: Notification Level

Numbers in brackets and [BOLD] type in the Table are the basis of effluent limitations.

#### **F. Interim Effluent Limitations**

Participation in the Working Group and timely and effective implementation of the Regional Board-approved Work Plans will constitute interim, performance-based effluent limitations to implement the wasteload allocations in the selenium TMDL. Adhering to these interim effluent limitations satisfies the requirement, during the implementation period of each Work Plan, to achieve compliance with the TMDLs and wasteload allocations “as soon as possible.” Compliance with the final effluent limitations is required “as soon as possible” but no later than December 20, 2009 for selenium. Dischargers who elect not to participate in the Work Plan approach will be required to comply immediately with the final selenium effluent limitations or to implement a suitable offset program approved by the Executive Officer.

#### **G. Land Discharge Specifications – Not Applicable**

#### **H. Reclamation Specifications – Not Applicable**

### **VI. RATIONALE FOR RECEIVING WATER LIMITATIONS**

#### **A. Surface Water**

The surface water receiving water limitations in the proposed Order are based upon the water quality objectives contained in the Basin Plan and are a required part of this Order.

#### **B. Groundwater**

The receiving groundwater limitations in the proposed Order are based upon the water quality objectives contained in the Basin Plan.

### **VII. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS**

Section 122.48 of 40 CFR requires all NPDES permits to specify recording and reporting of monitoring results. Sections 13267 and 13383 of the CWC authorize the Water Boards to require technical and monitoring reports. The MRP, Attachment E of this Order, establishes monitoring and reporting requirements to implement federal and state requirements. The following provides the rationale for the monitoring and reporting requirements contained in the MRP for this facility.

The principal purposes of a monitoring program by a Discharger are to:

1. Document compliance with waste discharge requirements and prohibitions established by the Regional Water Board,
2. Facilitate self-policing by the Discharger in the prevention and abatement of pollution arising from waste discharge,

3. Develop or assist in the development of limitations, discharge prohibitions, national standards of performance, pretreatment and toxicity standards, and other standards, and to
4. Prepare water and wastewater quality inventories.

The MRP is a standard requirement in almost all NPDES permits issued by the Regional Water Board, including this Order. It contains definitions of terms, specifies general sampling and analytical protocols, and sets out requirements for reporting of spills, violations, and routine monitoring data in accordance with NPDES regulations and the California Water Code.

Monitoring is the primary means of ensuring that waste discharge requirements are met. It is also the basis for enforcement actions against Dischargers who are in violation of the waste discharge requirements issued by the Regional Water Board. All Dischargers enrolled under this general permit will be required to conduct monitoring in accordance with a monitoring program issued by the Executive Officer. Each monitoring and reporting program will be customized for each enrollee based on the characteristics of the groundwater being treated and discharged. The typical required constituents and frequency of analyses are tabulated in the self-monitoring program attached to this general permit as "Attachment E." This monitoring and reporting program will be revised as appropriate. An increase of the parameters or frequency of monitoring will be required when monitoring data show the presence of petroleum hydrocarbons that are not limited in this Order, or toxicity test failures. A reduction of the parameters or frequency of monitoring may be implemented with prior approval of the Executive Officer when monitoring data demonstrate that such reduction is warranted. In accordance with the State Policy, for new Dischargers, this Order requires Dischargers applying for coverage under this general permit to monitor for the 17 congeners specified in the Policy, once during dry weather and once during wet weather for a one-year period. Existing Dischargers will not be required to monitor for the 17 congeners if monitoring for these substances have been conducted and nothing have been detected.

#### **A. Influent Monitoring**

Influent monitoring is required to determine the effectiveness of the treatment program and assess treatment plant performance.

#### **B. Effluent Monitoring**

The Discharger is required to conduct monitoring of the permitted discharges in order to evaluate compliance with permit conditions and to allow ongoing characterization of discharges to determine potential adverse impacts and to determine continued suitability for coverage under the General Permit. Monitoring requirements are given in the proposed monitoring and reporting program (Attachment E). This provision requires compliance with the monitoring and reporting program, and is based on 40 CFR 122.44(i), 122.62, 122.63 and 124.5. The self monitoring program (SMP) is a standard requirement in almost all NPDES permits (including the proposed Order) issued by the Regional Water Board. In addition to containing definitions of terms, it specifies general

sampling/analytical protocols and the requirements of reporting of spills, violations, and routine monitoring data in accordance with NPDES regulations, the California Water Code, and Regional Water Board's policies. Pollutants to be monitored include all pollutants for which effluent limitations are specified.

In addition to discharge rate, effluent is monitored for hardness, pH, total suspended and total dissolved solids, salinity, and turbidity. Monitoring is also required for certain metals and other priority, toxic pollutants which have water quality criteria established by the NTR and CTR, are determined to be present in the groundwater at a specific site location.

### **C. Whole Effluent Toxicity Testing Requirements**

Whole effluent toxicity (WET) protects the receiving water quality from the aggregate toxic effect of a mixture of pollutants in the effluent. WET tests measure the degree of response of exposed aquatic test organisms to an effluent. The WET approach allows for protection of the narrative "no toxics in toxic amounts" criterion while implementing numeric criteria for toxicity. There are two types of WET tests: acute and chronic. An acute toxicity test is conducted over a shorter time period and measures mortality. A chronic toxicity test is conducted over a longer period of time and may measure mortality, reproduction, and growth.

The Basin Plan specifies a narrative objective for toxicity, requiring that all waters be maintained free of toxic substances in concentrations that are lethal to or produce other detrimental response on aquatic organisms. Detrimental response includes but is not limited to decreased growth rate, decreased reproductive success of resident or indicator species, and/or significant alterations in population, community ecology, or receiving water biota.

This Order requires the Discharger to conduct acute toxicity testing of the effluent annually. This Order also requires the Discharger to conduct an Initial Investigation Toxicity Reduction Evaluation (IITRE) program when the acute toxicity test fails. Based on a review of monitoring data, there have been instances in which acute test failures can be attributed to salinity additions required to conduct the test. When this situation occurs, the Discharger normally performs additional acute testing of the effluent coupled with testing for all the priority pollutants. If the additional acute testing still fails and the priority pollutant scan shows no pollutants at levels of concern, acute testing is stopped and the acute test failure is presumed to be caused by ionic imbalance in the waste effluent (as described in relevant literature).

### **D. Receiving Water Monitoring - Not Applicable**

The MRP does not require characterization of receiving waters because most oftentimes treated discharges are to storm drains which are distant to receiving waters.

### **E. Other Monitoring Requirements - Not Applicable**

## **VIII. RATIONALE FOR PROVISIONS**

### **A. Standard Provisions**

Standard Provisions, which apply to all NPDES permits in accordance with section 122.41, and additional conditions applicable to specified categories of permits in accordance with section 122.42, are provided in Attachment D. The Discharger must comply with all standard provisions and with those additional conditions that are applicable under section 122.42.

40 CFR 122.41(a)(1) and (b) through (n) establish conditions that apply to all State-issued NPDES permits. These conditions must be incorporated into the permits either expressly or by reference. If incorporated by reference, a specific citation to the regulations must be included in this Order. Section 123.25(a)(12) allows the state to omit or modify conditions to impose more stringent requirements. In accordance with section 123.25, this Order omits federal conditions that address enforcement authority specified in sections 122.41(j)(5) and (k)(2) because the enforcement authority under the Water Code is more stringent. In lieu of these conditions, this Order incorporates by reference Water Code section 13387(e).

### **B. Special Provisions**

#### **1. Reopener Provisions**

This provision is based on 40 CFR Part 123. The Regional Water Board may reopen the permit to modify permit conditions and requirements. Causes for modifications include the promulgation of new regulations, or adoption of new regulations by the State Board or Regional Water Board, including revisions to the Basin Plan.

#### **2. Special Studies and Additional Monitoring Requirements – Non NSMP Working Group**

- a. This Order requires the Discharger to provide a specific plan and schedule for the investigation and implementation of volume-reduction and other selenium, nitrogen and TDS Best Management Practices (BMPs), and to implement that plan upon approval by the Executive Officer.

#### **3. Best Management Practices and Pollution Prevention**

The provisions in the Order are based on requirements already specified in general Order No. R8-2004-0021.

#### **4. Construction, Operation, and Maintenance Specifications**

The provisions are based on requirements already specified in general Order No. R8-2007-0008, as a result of installing/constructing the necessary treatment systems required to comply with the general permit waste discharge requirements.

#### **5. Special Provisions for Municipal Facilities - Not Applicable**

#### **6. Other Special Provisions**

The other special provisions in the Order require the Discharger(s) to implement the nitrogen or selenium offset programs upon approval by the Executive Officer.

The other special provisions in the Order are based on requirements already specified in general Order No. R8-2004-0021. Some of the other special provisions are as follows:

##### Nitrogen and Selenium Management Program Working Group:

Certain of the Dischargers subject to Order No. R8-2004-0021 have formed a Nitrogen Selenium Management Program Working Group (NSMP WG) and have funded and are currently participating in a Work Plan. The major NSMP Work Plan tasks are listed below. As shown, these include the development of a nitrogen and/or selenium offset, trading or mitigation program that is to be based on a comprehensive understanding of the groundwater-related nutrient/selenium inputs to surface waters in the Newport Bay watershed. The Order includes the following:

- a. Prepare a detailed Work Plan based upon the commitments and concepts presented in this Order and implement that Work Plan upon approval by the Executive Officer;
- b. Manage the Work Plan with input from identified technical experts, relevant regulatory agencies and the public;
- c. Perform complementary monitoring and assessment of nutrient and selenium sources in the watershed, utilizing, in part, ongoing studies performed by others;
- d. Evaluate nutrient TMDL nutrient load reduction targets, focusing especially on groundwater-related sources, loadings and reductions; and
- e. Develop a nutrient offset, trading or mitigation program based upon the outcome of other Work Plan elements.
- f. Identify and assess selenium treatment technologies, including potential future technologies;
- g. Identify and assess selenium Best Management Practices (BMPs) (including volume-reduction techniques)(task includes a “Quick Start” program for certain BMP assessments);
- h. Facilitate demonstration testing of identified selenium treatment technologies and BMPs;

- i. Develop and implement upon Executive Officer approval a selenium offset, trading or mitigation program based upon the outcome of complementary monitoring, treatment technology and BMP-related Work Plan elements; and
- j. Develop a selenium site-specific objective for the Newport Bay/San Diego Creek watershed if appropriate based upon outcome of other Work Plan elements.

Completion of the approved Work Plan is expected to result in the development of a comprehensive understanding of and management plan for nitrogen and selenium in groundwater-related inflows to surface waters in the Newport Bay watershed and as such, goes beyond issues specific to the discharges regulated under this Order. The management plans are expected to provide recommendations for specific load and wasteload allocations for the groundwater-related components of the “undefined source” category identified in the TMDLs, in addition to offset, trading or mitigation program recommendations. Revisions to the TMDLs and/or to the requirements in this Order may be necessary based on the results of the Work Plan assessments and resultant management plans.

When and if the Working Group has identified the selenium treatment technology (-ies) appropriate for these types of discharge, this Order may be reopened to include applicable technology-based effluent limitations, as appropriate.

This Order also recognizes that the Nitrogen Selenium Management Program Working Group is investigating selenium treatment and control technologies. This Order requires that if a practicable selenium treatment technology becomes available, the Discharger shall implement that technology and comply with the final selenium limits in this Order within one year of notification of the need to do so by the Regional Water Board, but in no case later than December 20, 2009.

## **7. Compliance Schedules**

The compliance schedule provisions in the Order are based on requirements already specified in general Order No. R8-2004-0021.

## **IX. PUBLIC PARTICIPATION**

The California Regional Water Quality Control Board, Santa Ana Region (Regional Water Board) is considering the issuance of waste discharge requirements (WDRs) that will serve as a National Pollutant Discharge Elimination System (NPDES) general permit for discharges to surface waters of extracted and treated groundwater resulting from groundwater dewatering operations and/or groundwater cleanup activities at sites within the San Diego Creek/Newport Bay watershed polluted by petroleum hydrocarbons, solvents, metals and/or salts. As a step in the WDR adoption process, the Regional Water Board staff has developed tentative WDRs. The Regional Water Board encourages public participation in the WDR adoption process.

## **A. Notification of Interested Parties**

The Regional Water Board has notified the Dischargers and interested agencies and persons of its intent to prescribe waste discharge requirements in this General Permit and provided them with an opportunity to submit their written comments and recommendations. Notification was provided through the posting of Notice of Public at the Regional Water Board website: <http://www.waterboards.ca.gov/santaana>, on October 31, 2007 and publication in the Orange County Register for one day.

## **B. Written Comments**

The staff determinations are tentative. Interested persons are invited to submit written comments concerning these tentative WDRs. Comments must be submitted either in person or by mail to the Executive Office at the Regional Water Board at the address above on the cover page of this Order.

To be fully responded to by staff and considered by the Regional Water Board, written comments should be received at the Regional Water Board offices by 5:00 p.m. on November 9, 2007 to:

Jane Qiu  
California Regional Water Quality Control Board  
Santa Ana Region  
3737 Main Street, Suite 500  
Riverside, CA 92501-3348

## **C. Public Hearing**

The Regional Water Board will hold a public hearing on the tentative WDRs during its regular Board meeting on the following date and time and at the following location:

Date: November 30, 2007  
Time: 9:00 A.M.  
Location: Irvine Ranch Water District  
15600 Sand Canyon Avenue  
Irvine, CA

Interested persons are invited to attend. At the public hearing, the Regional Water Board will hear testimony, if any, pertinent to the discharge, WDRs, and permit. Oral testimony will be heard; however, for accuracy of the record, important testimony should be in writing.

Please be aware that dates and venues may change. Our web address <http://www.waterboards.ca.gov/santaana> where you can access the current agenda for changes in dates and locations.

#### **D. Waste Discharge Requirements Petitions**

Any aggrieved person may petition the State Water Resources Control Board to review the decision of the Regional Water Board regarding the final WDRs. The petition must be submitted within 30 days of the Regional Water Board's action to the following address:

State Water Resources Control Board  
Office of Chief Counsel  
P.O. Box 100, 1001 I Street  
Sacramento, CA 95812-0100

#### **E. Information and Copying**

The Report of Waste Discharge (RWD), related documents, tentative effluent limitations and special provisions, comments received, and other information are on file and may be inspected at the address above at any time between 9:00 a.m. and 3:00 p.m. Monday through Friday. Copying of documents may be arranged through the Regional Water Board by calling (951) 782-41308.

#### **F. Register of Interested Persons**

Any person interested in being placed on the mailing list for information regarding the WDRs and NPDES permit should contact the Regional Water Board, reference this facility, and provide a name, address, and phone number.

#### **G. Additional Information**

Requests for additional information or questions regarding this Order should be directed to Jane Qiu at (951) 320-2008.

## ATTACHMENT G - EPA PRIORITY POLLUTANT LIST

| EPA PRIORITY POLLUTANT LIST                  |                                   |  |
|--|-----------------------------------|--|
| Metals                                       | Acid Extractibles                 | Base/Neutral Extractibles (continuation) |
| 1. Antimony                                  | 45. 2-Chlorophenol                | 91. Hexachloroethane                     |
| 2. Arsenic                                   | 46. 2,4-Dichlorophenol            | 92. Indeno (1,2,3-cd) Pyrene             |
| 3. Beryllium                                 | 47. 2,4-Dimethylphenol            | 93. Isophorone                           |
| 4. Cadmium                                   | 48. 2-Methyl-4,6-Dinitrophenol    | 94. Naphthalene                          |
| 5a. Chromium (III)                           | 49. 2,4-Dinitrophenol             | 95. Nitrobenzene                         |
| 5b. Chromium (VI)                            | 50. 2-Nitrophenol                 | 96. N-Nitrosodimethylamine               |
| 6. Copper                                    | 51. 4-Nitrophenol                 | 97. N-Nitrosodi-N-Propylamine            |
| 7. Lead                                      | 52. 3-Methyl-4-Chlorophenol       | 98. N-Nitrosodiphenylamine               |
| 8. Mercury                                   | 53. Pentachlorophenol             | 99. Phenanthrene                         |
| 9. Nickel                                    | 54. Phenol                        | 100. Pyrene                              |
| 10. Selenium                                 | 55. 2, 4, 6 – Trichlorophenol     | 101. 1,2,4-Trichlorobenzene              |

| 1,1,1 Trichloroethane                         | 0.5 | 2    |
| 1,1,2 Trichloroethane                         | 0.5 | 2    |
| Trichloroethylene                             | 0.5 | 2    |
| Vinyl Chloride                                | 0.5 | 2    |
| 1,2 Dichlorobenzene (volatile)                | 0.5 | 2    |
| 1,3 Dichlorobenzene (volatile)                | 0.5 | 2    |
| 1,4 Dichlorobenzene (volatile)                | 0.5 | 2    |

### Selection and Use of Appropriate ML Value:

**ML Selection:** When there is more than one ML value for a given substance, the discharger may select any one of those ML values, and their associated analytical methods, listed in this Attachment that are below the calculated effluent limitation for compliance determination. If no ML value is below the effluent limitation, then the discharger shall select the lowest ML value, and its associated analytical method, listed in the PQL Table.

**ML Usage:** The ML value in this Attachment represents the lowest quantifiable concentration in a sample based on the proper application of all method-based analytical procedures and the absence of any matrix interferences. Assuming that all method-specific analytical steps are followed, the ML value will also represent, after the appropriate application of method-specific factors, the lowest standard in the calibration curve for that specific analytical technique. Common analytical practices sometimes require different treatment of the sample relative to calibration standards.

**Note:** chemical names in parenthesis and italicized is another name for the constituent.

<sup>1</sup> The normal method-specific factor for these substances is 1, therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance.

**MINIMUM LEVELS IN PPB (µg/l)**

| <b>Table 2 – Semi-Volatile Substances<sup>2</sup></b> | <b>GC</b> | <b>GCMS</b> | <b>LC</b> |
|---|-----------|-------------|-----------|

| Zinc                                       | 20         |                  | 20              | 1            | 10                 |                     |             |                   | 1000       |
| Cyanide                                    |            |                  |                 |              |                    |                     |             | 5                 |            |

<sup>2</sup> With the exception of phenol by colorimetric technique, the normal method-specific factor for these substances is 1000, therefore, the lowest standards concentration in the calibration curve is equal to the above ML value for each substance multiplied by 1000.

<sup>3</sup> Phenol by colorimetric technique has a factor of 1.

<sup>4</sup> The normal method-specific factor for these substances is 1, therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance.

Techniques:

GC - Gas Chromatography

GCMS - Gas Chromatography/Mass Spectrometry

HRGCMS - High Resolution Gas Chromatography/Mass Spectrometry (i.e., EPA 1613, 1624, or 1625)

LC - High Pressure Liquid Chromatography

FAA - Flame Atomic Absorption

GFAA - Graphite Furnace Atomic Absorption

HYDRIDE - Gaseous Hydride Atomic Absorption

CVAA - Cold Vapor Atomic Absorption

ICP - Inductively Coupled Plasma

ICPMS - Inductively Coupled Plasma/Mass Spectrometry

SPGFAA - Stabilized Platform Graphite Furnace Atomic Absorption (i.e., EPA 200.9)

DCP - Direct Current Plasma

COLOR - Colorimetric

<sup>5</sup> The normal method-specific factor for these substances is 100, therefore, the lowest standard concentration in the calibration curve is equal to the above ML value for each substance multiplied by 100.

## ATTACHMENT I – TRIGGERS FOR MONITORING PRIORITY POLLUTANTS

|           | Constituent               | µg/L        |
|-----------|---------------------------|-------------|
| 1         | Antimony                  | 7           |
| 2         | Arsenic                   | 75          |

**Notes:**

1. For constituents not shown italicized, the values shown in the Table are fifty percent of the most stringent applicable receiving water objectives (freshwater or human health (consumption of water and organisms) as specified for that pollutant in 40 CFR 131.38<sup>6</sup>).
2. For constituents shown bold and italicized, the values shown in the Table are based on the California Department of Health Services maximum contaminant levels (MCLs) or Notification Level. Notification Level based trigger is underlined.
3. For hardness dependent metals, the hardness value used is 200 mg/L and for pentachlorophenol, the pH value used is 7.5 standard units.

California Regional Water Quality Control Board  
Santa Ana Region

July 20, 2009

STAFF REPORT

**ITEM: \*9**

**SUBJECT:** Amendment of Order No. R8-2007-0041, NPDES No. CAG918002, general discharge permit for discharges to surface waters of groundwater resulting from groundwater dewatering operations and/or groundwater cleanup activities at sites within the San Diego Creek/Newport Bay Watershed polluted by petroleum hydrocarbons, solvents, metals and/or salts - Order No. R8-2009-0045

**DISCUSSION:**

On November 30, 2007, the Regional Water Board adopted Order No. R8-2007-0041, NPDES No. CAG918002, prescribing general waste discharge requirements for discharges to surface waters of groundwater resulting from groundwater dewatering operations and/or groundwater cleanup activities at sites within the San Diego Creek/Newport Bay watershed polluted by petroleum hydrocarbons, solvents, metals and/or salts.

Order No. R8-2007-0041 consolidated the requirements of two general permits for discharges within the San Diego Creek/Newport Bay watershed: Order No. R8-2007-0008, NPDES No. CAG918001 (General Groundwater Cleanup Permit for Discharges to Surface Waters of Extracted and Treated Groundwater Resulting from the Cleanup of Groundwater Polluted by Petroleum Hydrocarbons, Solvents, Metals and/or Salts), and Order No. R8-2004-0021, NPDES No. CAG998001 (General Waste Discharge Requirements for Short-term Groundwater-Related Discharges and De Minimus Wastewater Discharges to Surface Waters within the San Diego Creek/Newport Bay Watershed). Specifically, Order No. 2007-0041 includes requirements to regulate groundwater-related discharges that may contain selenium, nutrients, volatile organic compounds, solvents or metals. The intent of this Order was to expedite the processing of applications and permitting for projects for which authorization under both Order No. 2007-0008 and Order No. R8-2004-0021 would otherwise have been necessary.

Order No. R8-2004-0021, NPDES No. CAG998002, regulates short-term groundwater-related discharges that are expected to last one year or less, and discharges that pose an insignificant threat to water quality (*de minimus* discharges) within the San Diego Creek/ Newport Bay watershed. This Order was amended by Order No. R8-2006-0065 to allow the discharge of wastewater effluent associated with pilot testing of selenium and nitrogen treatment technologies and BMPs and to prohibit the discharge of brine, resins, sludge or other secondary concentrates from treatment systems to surface waters. In summary, Order No. R8-2004-0021, as amended by Order No. R8-2006-0065, regulates the following types of discharges in the watershed:

- a. Short-term (one year or less duration) discharges from activities involving groundwater extraction and discharge:
  - (1) Wastes associated with well installation, development, test pumping and purging;
  - (2) Aquifer testing wastes;
  - (3) Dewatering wastes from subterranean seepage; and
  - (4) Groundwater dewatering wastes at construction sites.
- b. Discharges that pose an insignificant threat to water quality:
  - (1) Construction dewatering wastes not involving groundwater (except storm water dewatering at construction sites)<sup>1</sup>;
  - (2) Discharges resulting from hydrostatic testing of vessels, pipelines, tanks, etc.;
  - (3) Discharges resulting from the maintenance of potable water supply pipelines, tanks, reservoirs, etc.;
  - (4) Discharges resulting from the disinfection of potable water supply pipelines, tanks, reservoirs, etc.;
  - (5) Discharges from potable water supply systems resulting from system failures, pressure releases, etc.;
  - (6) Discharges from fire hydrant testing or flushing;
  - (7) Non-contact cooling water;
  - (8) Air conditioning condensate;
  - (9) Swimming pool drainage;
  - (10) Discharges resulting from diverted stream flows;
  - (11) Discharges from residential sump pumps; and
  - (12) Other similar types of wastes, which pose a *de minimus* threat to water quality, yet technically must be regulated under waste discharge requirements.
- c. Wastewater effluent associated with testing of selenium and nitrogen treatment technologies and BMPs.

In the process of consolidation of the requirements of Order No. R8-2004-0021, as amended by Order No. R8-2006-0065, into Order No. R8-2007-0041, certain types of discharges were inadvertently omitted. Specifically, Order No. R8-2007-0041 failed to include Items b. and c. of the above listing (i.e., *de minimus* types of discharges and wastewater associated with testing of selenium and nitrogen treatment technologies and BMPs). Order No. R8-2004-0021 is due to expire on December 20, 2009 and is not planned to be renewed since regulatory coverage can and will be provided under Order No. R8-2007-0041. However, it is necessary to amend Order No. R8-2007-0041 to include the discharges identified in items b. and c. above, as well as the discharge prohibition added by Order No. R8-2006-0065.

---

<sup>1</sup> Storm water discharges are covered under separate permit.

Furthermore, based on input from some of the Dischargers, it is necessary to clarify in Order No. R8-2007-0041, that for certain metals (including lead, cadmium, copper, chromium (II), nickel, silver, and zinc), the toxicity of which is hardness-dependent, the fifth percentile hardness value to be used in calculating the applicable criteria/effluent limits cannot exceed 400 mg/L, unless a site specific water effect ratio (WER) is developed and approved by the Regional Water Board. The California Toxic Rule, which specifies numeric criteria for these metals using equations in which hardness is a variable, explains that if the hardness is over 400 mg/L, two options are available to calculate the freshwater metals criteria: (1) Calculate the criterion using a default WER of 1.0 and using a hardness of 400 mg/L in the hardness equation; or (2) calculate the criterion using a WER and the actual ambient hardness of the surface water in the equation.

The following are the recommended changes to Order No. R8-2007-0041. Deleted text is struck out and added text is bold and highlighted.

1. Order No. R8-2007-0041, page 4, modify last paragraph of Section I. Discharge Information as follows:

This general permit will regulate **de minimus discharges and wastewater effluent associated with testing of selenium and nitrogen treatment technologies and BMPs, and** discharges of treated wastewater from groundwater dewatering and/or groundwater remediation activities at sites polluted by petroleum hydrocarbons, solvents, metals and/or salts within the San Diego Creek/Newport Bay watershed.

2. Order No. R8-2007-0041, page 6, modify paragraph 5., as follows:

5. The Discharger shall submit for approval by the Executive Officer of the Regional Water Board a fixed hardness value based on the 5th percentile of effluent hardness measurements or the average ambient receiving water hardness measurements for those sites polluted with metals (lead, cadmium, copper, chromium (III), nickel, silver, and zinc). **For purposes of calculating the applicable fresh water aquatic life criteria and effluent limitations for metals, the required fifth percentile hardness value has an upper limit of 400 mg/L as calcium carbonate, unless a site specific water effect ratio (WER) is developed and approved by the Regional Water Board. The California Toxic Rule explains that if the hardness is over 400 mg/L, two options are available to calculate the freshwater metals criteria (which are used as the basis for setting effluent limitations): (1) Calculate the criterion using a default WER of 1.0 and using a hardness of 400 mg/L in the hardness equation; or (2) calculate the criterion using a WER and the actual ambient hardness of the surface water in the equation.**

3. Order No. R8-2007-0041, page 8, modify paragraph II.B.3., as follows:

3. For freshwater discharges, within forty five (45) days of the effective date of this Order, Dischargers from those sites polluted with leaded gasoline or metals shall submit for approval by the Regional Water Board Executive Officer the proposed hardness value based on 5th percentile of effluent hardness measurements or the average ambient freshwater receiving water hardness measurements. Once approved by the Executive Officer, this hardness value shall be the basis for determining the lead/metals effluent limits for the discharge from Attachment "BJ" of this Order.

4. Order No. R8-2007-0041, page 10, modify last paragraph of Finding B., as follows:

In summary, this general permit will regulate discharges from activities involving groundwater dewatering, **discharges that pose an insignificant threat to water quality, wastewater effluent associated with testing of selenium and nitrogen treatment technologies and BMPs** and groundwater remediation in areas where contamination from petroleum hydrocarbons, solvents, metals and/or salts may be present. These activities include the following:

1. Wastes associated with well installation, development, test pumping and purging;
2. Aquifer testing wastes;
3. Dewatering wastes from subterranean seepage;
4. Groundwater dewatering wastes at construction sites; and
5. Groundwater remediation.
6. **Discharges resulting from hydrostatic testing of vessels, pipelines, tanks, etc.;**
7. **Discharges resulting from the maintenance of potable water supply pipelines, tanks, reservoirs, etc.;**
8. **Discharges resulting from the disinfection of potable water supply pipelines, tanks, reservoirs, etc.;**
9. **Discharges from potable water supply systems resulting from initial system startup, routine startup, sampling of influent flow, system failures, pressure releases, etc.;**
10. **Discharges from fire hydrant testing or flushing;**
11. **Air conditioning condensate;**
12. **Swimming pool discharge;**
13. **Discharges resulting from diverted stream flows;**
14. **Decanted filter backwash wastewater and/or sludge dewatering filtrate water from water treatment facilities;**
15. **Discharges of wastewater effluent associated with testing of selenium and nitrogen treatment technologies and BMPs into surface water; and**
16. **Other similar types of wastes as determined by the Regional Water Board Executive Officer, which pose a de minimus threat to water quality yet must be regulated under waste discharge requirements.**

5. Order No. R8-2007-0041, page 17, add new paragraph G. in Section IV., as follows:

**G. The discharge of brine, resins, sludge or other secondary concentrates from treatment systems to surface waters is prohibited.**

**RECOMMENDATION:**

Adopt Order No. R8-2009-0045 as presented.

California Regional Water Quality Control Board  
Santa Ana Region

Order No. R8-2009-0045

Amending Order No. R8-2007-0041, NPDES No. CAG918002  
General Discharge Permit For Discharges To Surface Waters Of Groundwater  
Resulting From Groundwater Dewatering Operations And/Or Groundwater Cleanup  
Activities At Sites Within The San Diego Creek/Newport Bay Watershed Polluted By  
Petroleum Hydrocarbons, Solvents, Metals And/Or Salts

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Water Board), finds that:

1. On November 30, 2007, the Regional Water Board adopted Order No. R8-2007-0041, NPDES No. CAG918002, prescribing general waste discharge requirements for discharges to surface waters of groundwater resulting from groundwater dewatering operations and/or groundwater cleanup activities at sites within the San Diego Creek/Newport Bay watershed polluted by petroleum hydrocarbons, solvents, metals and/or salts.
2. Order No. R8-2007-0041 consolidated the requirements of two general permits for discharges within the San Diego Creek/Newport Bay watershed; Order No. R8-2007-0008, NPDES No. CAG918001, and Order No. R8-2004-0021, NPDES No. CAG998001. Specifically, Order No. R8-2007-0041 includes requirements to regulate groundwater-related discharges that may contain selenium, nutrients, volatile organic compounds, solvents or metals.
3. Order No. R8-2004-0021, NPDES No. CAG998002, regulates the short-term groundwater-related discharges that are expected to last one year or less, and discharges that pose an insignificant threat to water quality (de minimus discharges) within the San Diego Creek/Newport Bay watershed. This Order was amended by Order No. R8-2006-0065 to authorize discharges of wastewater effluent associated with testing of selenium and nitrogen treatment technologies and BMPs and to prohibit the discharge of brine, resins, sludge or other secondary concentrates from treatment systems to surface waters.
4. In the process of consolidation of permit requirements in Order No. R8-2007-0041, certain discharges regulated under Order No. R8-2004-0021, as amended, were omitted. Specifically, Order No. R8-2007-0041 failed to include de minimus discharges and wastewater effluent associated with testing of selenium and nitrogen treatment technologies and BMPs. Further, Order No. R8-2007-0041 failed to include the prohibition regarding the discharge of brine, resins, sludge or other secondary concentrates from treatment systems to surface waters. Order No. R8-2004-0021 is due to expire on December 20, 2009 and is not planned to

be renewed since regulatory coverage can and should be provided under Order No. R8-2007-0041. However, it is necessary to amend Order No. R8-2007-0041 to include the previously omitted de minimus discharges, discharges resulting from the testing of nitrogen and selenium treatment technologies and BMPs, and to include the prohibition specified in Order No. R8-2006-0065.

5. In accordance with California Water Code Section 13389, amending the general waste discharge requirements for the types of discharges regulated under Order No. R8-2007-0041 is exempt from those provisions of the California Environmental Quality Act contained in Chapter 3 (Commencing with Section 21100), Division 13 of the Public Resources Code.
6. The Regional Water Board has notified the dischargers and other interested agencies and persons of its intent to amend Order No. R8-2007-0041 and has provided them with an opportunity to submit their written views and recommendations.
7. The Regional Water Board, in a public meeting, heard and considered all comments pertaining to the amendment of general waste discharge requirements for de minimus discharges.

**IT IS HEREBY ORDERED** that Order No. R8-2007-0041 be amended as follows:

1. Order No. R8-2007-0041, page 4, modify last paragraph of Section I. Discharge Information as follows:

This general permit will regulate de minimus discharges and wastewater effluent associated with testing of selenium and nitrogen treatment technologies and BMPs, and discharges of treated wastewater from groundwater dewatering and/or groundwater remediation activities at sites polluted by petroleum hydrocarbons, solvents, metals and/or salts within the San Diego Creek/Newport Bay watershed.

2. Order No. R8-2007-0041, page 6, modify paragraph 5., as follows:
  5. The Discharger shall submit for approval by the Executive Officer of the Regional Water Board a fixed hardness value based on the 5th percentile of effluent hardness measurements or the average ambient receiving water hardness measurements for those sites polluted with metals (lead, cadmium, copper, chromium (III), nickel, silver, and zinc). For purposes of calculating the applicable fresh water aquatic life criteria and effluent limitations for metals, the required fifth percentile hardness value has an upper limit of 400 mg/L as calcium carbonate, unless a site specific water effect ratio (WER) is

developed and approved by the Regional Water Board. The California Toxic Rule explains that if the hardness is over 400 mg/L, two options are available to calculate the freshwater metals criteria (which are used as the basis for setting effluent limitations): (1) Calculate the criterion using a default WER of 1.0 and using a hardness of 400 mg/L in the hardness equation; or (2) calculate the criterion using a WER and the actual ambient hardness of the surface water in the equation.

3. Order No. R8-2007-0041, page 8, modify paragraph II.B.3., as follows:

3. For freshwater discharges, within forty five (45) days of the effective date of this Order, Dischargers from those sites polluted with leaded gasoline or metals shall submit for approval by the Regional Water Board Executive Officer the proposed hardness value based on 5th percentile of effluent hardness measurements or the average ambient freshwater receiving water hardness measurements. Once approved by the Executive Officer, this hardness value shall be the basis for determining the lead/metals effluent limits for the discharge from Attachment "B" of this Order.

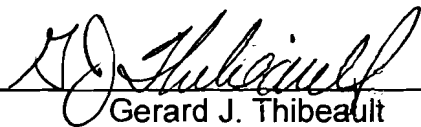

4. Order No. R8-2007-0041, page 10, modify last paragraph of Finding B., as follows:

In summary, this general permit will regulate discharges from activities involving groundwater dewatering, discharges that pose an insignificant threat to water quality, wastewater effluent associated with testing of selenium and nitrogen treatment technologies and BMPs and groundwater remediation in areas where contamination from petroleum hydrocarbons, solvents, metals and/or salts may be present. These activities include the following:

1. Wastes associated with well installation, development, test pumping and purging;
2. Aquifer testing wastes;
3. Dewatering wastes from subterranean seepage;
4. Groundwater dewatering wastes at construction sites;
5. Groundwater remediation.
6. Discharges resulting from hydrostatic testing of vessels, pipelines, tanks, etc.;
7. Discharges resulting from the maintenance of potable water supply pipelines, tanks, reservoirs, etc.;
8. Discharges resulting from the disinfection of potable water supply pipelines, tanks, reservoirs, etc.;
9. Discharges from potable water supply systems resulting from initial system startup, routine startup, sampling of influent flow, system failures, pressure releases, etc.;
10. Discharges from fire hydrant testing or flushing;
11. Air conditioning condensate;
12. Swimming pool discharge;

13. Discharges resulting from diverted stream flows;
  14. Decanted filter backwash wastewater and/or sludge dewatering filtrate water from water treatment facilities;
  15. Discharges of wastewater effluent associated with testing of selenium and nitrogen treatment technologies and BMPs into surface water; and
  16. Other similar types of wastes as determined by the Regional Water Board Executive Officer, which pose a de minimus threat to water quality yet must be regulated under waste discharge requirements.
5. Order No. R8-2007-0041, page 17, add new paragraph G. in Section IV., as follows:
- G. The discharge of brine, resins, sludge or other secondary concentrates from treatment systems to surface waters is prohibited.
6. All other conditions and requirements of Order No. R8-2007-0041 shall remain unchanged

I, Gerard J. Thibeault, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of an order adopted by the California Regional Water Quality Control Board, Santa Ana Region, on July 20, 2009.

  
Gerard J. Thibeault  
Executive Officer

**California Regional Water Quality Control Board  
Santa Ana Region**

**December 10, 2009**

**Item: 9**

**Subject: Issuance of Time Schedule Order No. R8-2009-0069** for Dischargers Enrolled in Order No. R8-2007-0041, NPDES No. CAG918002, General Discharge Permit for Discharges to Surface Waters of Groundwater Resulting from Groundwater Dewatering Operations and/or Groundwater Cleanup Activities at sites within the San Diego Creek/Newport Bay Watershed Polluted by Petroleum Hydrocarbons, Solvent, Metals and/or Salts.

**Summary:**

The issuance of Time Schedule Order (TSO) No. R8-2009-0069 is appropriate and necessary to provide additional time for dischargers in the Newport Bay watershed to come into compliance with numeric effluent limitations for selenium that are specified in Order No. R8-2007-0041, which requires compliance with those limitations no later than December 20, 2009. The numeric selenium limitations are based on the current selenium water quality objectives established by the California Toxics Rule (CTR).

Total Maximum Daily Loads (TMDLs) and site-specific objectives (SSOs) for selenium are being developed by Regional Board staff in collaboration with the Nitrogen and Selenium Management Program (NSMP) Working Group. The TMDLs include numeric targets and allocations based on (i) the recommended selenium SSOs for the Newport Bay watershed, and, in the event the SSOs are not adopted, (ii) current CTR selenium objectives. These TMDLs and SSOs are expected to be presented to the Regional Board for consideration in the spring of 2010.

When approved, the selenium SSOs will replace the existing CTR-based water quality objectives for the Newport Bay watershed. The selenium effluent limitations in Order No. R8-2007-0041 will be revised as necessary in response to the approved TMDLs/SSOs.

The proposed TMDLs include an implementation plan and a schedule for compliance that will serve as the basis for a revised schedule for compliance with the selenium effluent limitations in Order No. R8-2007-0041. However, the compliance schedule authorization provided by the TMDLs will not become effective for the purposes of revising Order No. R8-2007-0041 until the TMDLs are approved by the USEPA. The TMDL approval process is expected to take more than one year. The TSO will extend the schedule for compliance with the numeric selenium effluent limitations in Order No. R8-2007-0041 for a maximum

of five years from the date of adoption of the TSO. This compliance schedule extension will allow the TMDL/SSO approval and permit amendment processes to be completed such that an appropriate compliance schedule, effluent limitations, and other requirements can be incorporated in the waste discharge requirements. This compliance schedule extension is appropriate because of the very significant commitment of resources by the NSMP Working Group to assist in the development of the selenium TMDLs/SSOs and a cutting-edge regional selenium management program (including development of selenium treatment technologies) for the Newport Bay watershed that will result in the achievement of water quality standards for a very difficult-to-address bioaccumulative pollutant.

**Discussion:**

In 2002, as part of a number of TMDLs for toxic pollutants, USEPA promulgated TMDLs for selenium for the San Diego Creek subwatershed and both Upper and Lower Newport Bay, based primarily on exceedance of the currently applicable CTR selenium criteria for freshwater, as well as trends in selenium concentrations in freshwater fish tissue and the proximity of Newport Bay to the San Diego Creek subwatershed. Rising groundwater in the San Diego Creek subwatershed is the primary source of selenium to the Bay.

In December 2004, the Regional Board adopted Order No. R8- 2004-0021, NPDES No. CAG998002, General Waste Discharge Requirements for Short-Term Groundwater-Related Discharges and De Minimis Wastewater Discharges to Surface Waters within the San Diego Creek/Newport Bay Watershed. Prior to the issuance of Order No. R8-2004-0021, most dewatering and other types of groundwater discharges in the watershed were considered insignificant, or "de minimus", contributors of pollutants and had been regulated under the Regional Board's general de minimus NPDES permit. The issuance of Order No. R8-2004-0021 was necessitated by the recognition that groundwater-related discharges in the Newport Bay watershed had the potential to contribute selenium to the surface waters in the watershed and that such discharges could no longer be considered insignificant in light of the findings of selenium impairment leading to the USEPA TMDLs. Order No. R8-2004-0021 included final numeric water quality based effluent limitations for selenium discharges based on the applicable CTR selenium criteria.

In adopting Order No. R8-2004-0021, the Regional Board also recognized that there were no conventional selenium treatment technologies that could be applied to achieve the selenium limitations and that, therefore, immediate compliance with the selenium limitations in the Order would likely be infeasible for many dischargers. Accordingly, Order No. R8-2004-0021 includes a schedule for compliance with the final numeric selenium limitations. Pursuant to the compliance schedule provisions of the State Board's policy for

implementation of the CTR criteria (the "SIP"<sup>1</sup>), Order No. R8-2004-0021 included a maximum five-year schedule for compliance with the selenium limitations, i.e, compliance with the selenium limitations was to be achieved as soon as possible but no later than December 20, 2009.

Numerous stakeholders within the Newport Bay watershed expressed ongoing concern that ultimate compliance with the selenium limitations, even with the five-year compliance schedule, would be highly problematic, given the lack of available, practicable treatment technology that could achieve the requisite selenium reductions. This concern, coupled with concerns about the validity and effectiveness of the CTR criteria for protecting biological resources in the watershed, prompted the formation of a voluntary program known as the Nitrogen and Selenium Management Program (NSMP), sponsored by the NSMP Working Group. The Working Group is comprised of many stakeholders in the Newport Bay watershed, including the County of Orange, municipalities within the watershed, other dischargers, and several environmental organizations. The Regional Board is a non-funding member of the Working Group. The Working Group proposed to develop and implement a five-year Work Plan designed to evaluate and recommend refinements to the USEPA selenium TMDLs, to develop treatment technologies and an appropriate implementation plan for the refined TMDLs, and to consider recommendations for a site-specific selenium objective for the Newport Bay watershed that would supplant the CTR selenium criteria<sup>2</sup>.

Order No. R8-2004-0021 included requirements that reflected the proposed NSMP Working Group approach and required the development, Regional Board approval, and thence implementation of a Work Plan to accomplish those specific tasks. Order No. R8-2004-0021 provided that participation by dischargers in the NSMP Working Group and effective and timely implementation of the approved Work Plan would constitute interim, performance-based limitations. The Order also allowed dischargers who did not wish to participate in the NSMP Working Group to implement a program approved by the Executive Officer to offset selenium discharges in excess of the final numeric effluent limitations. Steps to implement that offset program were considered interim, performance-based limitations. The intent of the offset program was to assure that there would be no net loading of selenium to surface waters in the Newport Bay watershed as the result of the discharges prior to full compliance with the final numeric effluent limitations.

In 2007, the Regional Board adopted Order No. R8-2007-0041 as part of a permit streamlining effort. Like Order No. R8-2004-0021, Order No. R8-2007-

---

<sup>1</sup> "Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California"

<sup>2</sup> The Working Group also committed to perform work to support the review of the Nutrient TMDL established for the Newport Bay watershed in 1998 and to formulate a nutrient management plan.

0041 regulates groundwater-related discharges but also includes requirements for discharges from groundwater cleanup operations within the Newport Bay watershed. This combined approach obviates the need for dischargers who may need authorization for both types of discharges to obtain coverage under both permits, for which payment of both permit fees would be required. Order No. R8-2007-0041 includes the same NSMP/offset interim performance-based limitations as Order No. R8-2004-0021. Consistent with the SIP, Order No. R8-2007-0041 maintains the same compliance schedule for achieving compliance with final numeric water quality based effluent limitations for selenium as Order No. R8-2004-0021, i.e., compliance with the final numeric effluent limitations must be achieved no later than December 20, 2009.<sup>3</sup> Discharge authorization for enrollees under Order No. R8-2004-0021 has been transferred to Order No. R8-2007-0041 and Order No. R8-2004-0021 now has been rescinded.

The approved NSMP Work Plan has now been essentially completed and has resulted in recommended, revised TMDLs, including an implementation plan. The TMDLs, including the implementation plan, are continuing to be refined further and are expected to be presented as a Basin Plan amendment for the Regional Board's consideration in the spring of 2010. Further, the NSMP Working Group effort has resulted in specific recommendations for site-specific objectives (SSOs) for selenium for the Newport Bay watershed. When fully approved, these SSOs will replace the CTR-based objectives for selenium in the Newport Bay watershed. These SSOs are reflected in the TMDLs to be recommended to the Regional Board and will be included in the Basin Plan amendment package to be considered by the Regional Board in the spring of 2010. In the event the SSOs are not adopted, the TMDLs also include alternative CTR-based numeric targets and allocations.

The proposed TMDLs currently include a recommended compliance schedule of a maximum of 15 years from the date the TMDLs become effective. The TMDLs become effective for NPDES and other Clean Water Act purposes once they are approved by USEPA. Once the TMDLs are fully approved, including by USEPA, the compliance schedule authorization provided in the TMDLs can be used as the basis for including compliance schedules for selenium limitations in NPDES permits. Once the TMDLs are finally approved, Regional Board staff will recommend specific revisions to Order No. R8-2007-0041 (and/or the issuance of a new permit, as appropriate) to incorporate requirements consistent with the TMDLs, including revised schedules for compliance and selenium effluent limitations (including, potentially, narrative or performance-based limitations). However, until the TMDL approval process is completed, the effective compliance date for those limits are those established in the existing Order. The TSO will provide for compliance with the existing Order.

---

<sup>3</sup> The first time that the selenium-related discharges were subject to CTR-based effluent limitations was in Order No. R8-2004-0021, and discharges were required to meet CTR-based effluent limits no later than December 20, 2009.

While significant progress has been made to identify potential selenium treatment technologies (including regional treatment), compliance with the final numeric selenium limitations in Order No. R8-2007-0041 on December 20, 2009 remains infeasible for many dischargers. A significant amount of work remains to be done to further evaluate potential treatment technologies to assure their efficacy before costly, full-scale implementation is considered. The Working Group has prepared a draft BMP Strategic Plan that outlines the steps proposed to further address selenium BMP evaluation and implementation over the fifteen year period currently proposed by the draft TMDLs. Implementation of the BMP Strategic Plan is expected to result in compliance with the draft TMDLs and, thereby, water quality standards (as they may or may not be amended by the SSOs). The development and implementation of such a BMP plan is a requirement of the draft TMDLs for dischargers who elect to comply with applicable allocations through the NSMP process.

Absent additional compliance schedule relief, after December 20, 2009, groundwater-related discharges by the dischargers enrolled in Order No. R8-2007-0041 may result in violations of the final selenium effluent limitation in that Order. Such violations would likely result in the imposition of mandatory minimum penalties pursuant to section 13385 of the California Water Code.

Controlling sources of selenium inputs to surface waters in the Newport Bay watershed poses extraordinary challenges. As stated above, there is currently no readily available, conventional treatment technology that can be implemented in a reasonably practicable manner for point source or non-point sources of selenium. Further, in the Newport Bay watershed, approximately 85% of the existing selenium loads in surface waters originates from groundwater, and much of this load (about 78%) results from diffuse rising groundwater, which enters surface waters via springs and seeps in the unlined portions of the channels, and cracks and weepholes in storm drains and the concrete-lined portions of the channels. Discrete, groundwater-related discharges (e.g., groundwater dewatering and cleanup) and other regulated discharges (e.g., urban runoff) account for a relatively small part of the selenium load to surface waters. It is evident that selenium reductions needed to protect beneficial uses would be best achieved on a regional, watershed-wide scale.

The NSMP Working Group has made, and continues to make significant commitments of resources to develop a proposed watershed-wide selenium management strategy that will address rising groundwater, as well as dewatering and other types of discharges. The TMDLs that will be recommended to the Regional Board in early spring 2010 rely to a significant degree on that management strategy and its implementation. In light of those significant commitments by the Working Group, that a management strategy has been identified that is believed will achieve water quality standards but requires additional time to be approved and implemented, and in view of the recognized need to provide more time to evaluate and implement effective selenium

treatment BMPs, it is appropriate to provide additional schedule relief for compliance with the numeric selenium limitations in Order No. R8-2007-0041. Additional compliance schedule relief will allow for full approval of the TMDLs/SSOs and revision of the Order to incorporate revised compliance schedules and effluent limitations consistent with the TMDLs. The issuance of the TSO will not delay ultimate compliance with the TMDLs. Rather, the TSO will merely provide additional time for approval of the TMDLs/SSOs while protecting the dischargers who have committed and will commit significant resources to their development and implementation from enforcement for violations of Order No. R8-2007-0041.

California Water Code section 13300 states: "Whenever a regional board finds that a discharge of waste is taking place or threatening to take place that violates or will violate requirements prescribed by the regional board, or the state board, or that the waste collection, treatment, or disposal facilities of a discharger are approaching capacity, the board may require the discharger to submit for approval of the board, with such modifications as it may deem necessary, a detailed time schedule of specific actions the discharger shall take in order to correct or prevent a violation of requirements." A detailed time schedule of actions proposed to address final selenium effluent limitation compliance has been submitted and is reflected in Tentative TSO No. R8-2009-0069. Dischargers seeking coverage under the TSO are required to implement these tasks in accordance with the schedule identified.

Once the TMDLs are approved and Order No. R8-2007-0041 is revised accordingly, including a revised schedule for compliance and selenium effluent limitations, the TSO will be rescinded.

**Recommendation:** Adopt Time Schedule Order No. R8-2009-0069 as presented.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD  
SANTA ANA REGION

TIME SCHEDULE ORDER NO. R8-2009-0069

For

DISCHARGERS ENROLLED UNDER ORDER NO. R8-2007-0041, NPDES NO. CAG918002,  
GENERAL DISCHARGE PERMIT FOR DISCHARGES TO SURFACE WATERS OF  
GROUNDWATER RESULTING FROM GROUNDWATER DEWATERING OPERATIONS  
AND/OR GROUNDWATER CLEANUP ACTIVITIES AT SITES WITHIN THE SAN DIEGO  
CREEK/NEWPORT BAY WATERSHED POLLUTED BY PETROLEUM HYDROCARBONS,  
SOLVENTS, METALS AND/OR SALTS

The California Regional Water Quality Control Board, Santa Ana Region (Regional Water Board), finds that:

1. In May 2000, the United States Environmental Protection Agency (USEPA) promulgated what is known as the California Toxics Rule (CTR), which consists of numeric water quality criteria for priority toxic pollutants and other water quality standards provisions to be applied to waters in the State of California (State). (See 40 C.F.R. 131.38.) USEPA promulgated the CTR based on a determination that the numeric criteria are necessary to protect human health and the environment. The CTR contains a numeric chronic aquatic life criterion for selenium in freshwater of 5 micrograms per liter (5 µg/L), as total recoverable selenium, and in saltwater of 71 µg/L, as total dissolved selenium. (40 C.F.R. 131.38(b)(1).)
2. The CTR provides the State with discretion in how to implement the relevant criteria. Accordingly, in March 2000, the State Water Resources Control Board ("State Water Board") adopted the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (SIP). The State Water Board amended the SIP in February 2005 with Resolution No. 2005-0019. USEPA has approved the SIP for use as the State's implementation plan for CTR constituents.
3. On June 14, 2002, USEPA promulgated Total Maximum Daily Loads (TMDLs) for Toxic Pollutants in San Diego Creek and Newport Bay. TMDLs were established for organochlorine compounds, organophosphate pesticides, metals (chromium, cadmium, mercury, copper, lead and zinc) and selenium.
4. The USEPA TMDLs established waste load allocations (WLAs) for discharges of groundwater to surface water for selenium based on the CTR chronic criteria for selenium in freshwater and saltwater. However, USEPA's TMDLs are not self-executing, contain no implementation plan, and have not been incorporated into the Basin Plan for the Santa Ana Region. Neither the State nor Regional Water Board has developed an implementation plan for the USEPA TMDLs.

5. On December 20, 2004, the Regional Water Board adopted General Waste Discharge Requirements for Short-Term Groundwater-Related Discharges and De Minimus Wastewater Discharges to Surface Waters within the San Diego Creek/Newport Bay Watershed, Order No. R8-2004-0021, NPDES No. CAG998002. Pursuant to the SIP, the Regional Water Board incorporated numeric selenium effluent limits based on the CTR chronic freshwater and saltwater aquatic life criteria into Order No. R8-2004-0021, with a compliance schedule requiring compliance with the final effluent limits to be achieved no later than December 20, 2009. As interim compliance measures, Order No. R8-2004-0021 allowed for compliance with the selenium effluent limitations through either an approved offset program or participation in the Nitrogen and Selenium Management Program [NSMP] prior to the December 20, 2009 date.
6. On October 13, 2006, the Regional Water Board adopted Order No. R8-2006-0065, which amended the type and nature of discharges authorized under Order No. R8-2004-0021.
7. On November 30, 2007, the Regional Water Board adopted Order No. R8-2007-0041, NPDES No. CAG918002. Order No. R8-2007-0041 is a general permit that regulates discharges of treated wastewater from groundwater dewatering and/or groundwater remediation activities at sites polluted by petroleum hydrocarbons, solvents, metals and/or salts within the San Diego Creek/Newport Bay watershed. Consistent with Order No. R8-2004-0021, Order No. R8-2007-0041 required compliance with final effluent limits based on the CTR chronic criteria for selenium by no later than December 20, 2009. Order No. R8-2007-0041 has replaced Order No. R8-2004-0021, and Order No. R8-2004-0021 has been rescinded.
8. Order No. R8-2007-0041 was later amended by Order No. R8-2009-0045, which was adopted by the Regional Water Board on July 20, 2009. Order No. R8-2009-0045 amended Order No. R8-2007-0041 by expanding and clarifying the nature of the discharges allowed under Order No. R8-2007-0041.
9. As of the date of this Order, the following entities are enrollees under Order No. R8-2007-0041 ("Existing Dischargers"):

| <u>Enrollees</u>                      | <u>Facility</u>                   | <u>Effective Date</u> |
|---------------------------------------|-----------------------------------|-----------------------|
| Ca Dept of Transportation District 12 | Dewatering-Irvine-Various-Newport | 6/14/2005             |
| Irvine Company                        | Dewatering, General               | 12/20/2004            |

Entities that enroll under Order No. R8-2007-0041 after the effective date of this Order are referred to as "Future Dischargers." Any entity that enrolls under Order No. R8-2007-0041 is a "Discharger." Although listed above as an Existing Discharger, the City of Irvine, and potentially others, is not presently discharging under Order No. R8-2007-0041 and the City of Irvine has no present intention of discharging thereunder for the foreseeable future.

10. Section V.A.1.a of Order No. R8-2007-0041 contains final effluent limitations based on CTR criteria for total recoverable selenium for discharges to San Diego Creek and its tributaries at the following levels: (1) the maximum daily concentration limit ( $\mu\text{g/L}$ ) is 8.2; and (2) the average monthly concentration limit ( $\mu\text{g/L}$ ) is 4.1.
11. Section V.A.1.a of Order No. R8-2007-0041 contains final effluent limitations based on CTR criteria for total recoverable selenium for discharges to Upper and Lower Newport Bay at the following levels: (1) the maximum daily concentration limit ( $\mu\text{g/L}$ ) is 116; and (2) the average monthly concentration limit ( $\mu\text{g/L}$ ) is 58.
12. Section V.A.1.b of Order No. R8-2007-0041 provides that compliance with the selenium effluent limitations specified in Section V.A.1.a shall be achieved as soon as possible but no later than December 20, 2009.
13. In response to Order No. R8-2004-0021, many of the San Diego Creek/Newport Bay watershed stakeholders/dischargers established a Nitrogen and Selenium Management Program (NSMP) Working Group. The NSMP Working Group includes representatives from local governments and agencies, developers and other private entities, water districts, State agencies including the Regional Water Board, and environmental groups.
14. Order No. R8-2004-0021 required the NSMP Working Group to develop a work plan to assist in identifying a comprehensive management plan for selenium and nitrogen and, in particular, to identify an approach to address rising groundwater, the largest source of selenium in the watershed. The NSMP Work Plan and Compliance Strategy (Work Plan) was approved by the Executive Officer of the

Regional Water Board in July 2005. The Working Group has been implementing the approved Work Plan since July 2005.

15. The NSMP Work Plan included a number of selenium-related tasks, including the development of a conceptual model for selenium, an evaluation of selenium sources and loads, an assessment of the bioavailability and impacts of selenium on beneficial uses in the watershed, an evaluation of selenium speciation analytical methods, an evaluation and selection of potentially viable Best Management Practices (BMPs) and treatment technologies for selenium, pilot testing of the most promising BMPs/treatment technologies, and, if necessary and/or appropriate, the development of site-specific objectives (SSOs) for selenium.
16. Controlling sources of selenium in the Newport Bay watershed poses extraordinary challenges given the watershed-wide scale of the selenium problem, its diffuse origin (largely rising groundwater) and the limited land available for placement of treatment facilities and BMPs because of the high degree of urbanization in the watershed. In addition, there is currently no readily available, conventional treatment technology that can be implemented in a reasonably practicable manner for point source discharges. In the Newport Bay watershed, approximately 85% of the existing selenium loads in surface waters originates from groundwater, and much of this load (about 78%) results from diffuse rising groundwater, which enters surface waters via springs and seeps in the unlined portions of the channels, and cracks and weepholes in storm drains and the concrete-lined portions of the channels. Discrete, groundwater-related discharges (e.g., groundwater dewatering and cleanup) and other regulated discharges (e.g., urban runoff) account for a relatively small part of the selenium load to surface waters. Therefore, selenium reductions needed to protect beneficial uses are best achieved on a regional, watershed-wide scale, addressing both non-point and point sources.
17. At this time, Regional Water Board staff, in collaboration with the NSMP Working Group, is developing TMDLs and SSOs for selenium in the Newport Bay watershed<sup>1</sup> to be presented for consideration by the Regional Water Board in early 2010 (the "Board TMDLs/SSOs"). Once approved, the SSOs will replace the CTR criteria for the relevant water bodies. As currently designed, implementation of the Board TMDLs/SSOs will involve a collaborative watershed-based approach coordinated by and through the NSMP Working Group.

---

<sup>1</sup> The Newport Bay watershed encompasses both upper and lower Newport Bay and its tributaries, San Diego Creek, Santa Ana Delhi, and Big Canyon subwatersheds, and the Costa Mesa and Santa Isabel channels. To date, NPDES permits, TMDLs and amendments to the Basin Plan for the Santa Ana Region have referred to the watershed as the "San Diego Creek/Newport Bay" watershed. However, the County of Orange recently performed a comprehensive evaluation of all the watersheds located within their boundaries with the intent of verifying watershed divisions and nomenclature. The County decided that the San Diego Creek/Newport Bay watershed would simply be referred to as the Newport Bay watershed. All of the County programs, including the NPDES program, and all County documents now refer to the Newport Bay watershed. For consistency with the new nomenclature, these TMDLs/SSOs will also refer to the watershed as the Newport Bay watershed. Similarly, future NPDES permits will employ this nomenclature.

18. Through development of the Board TMDLs/SSOs and the NSMP, considerable new information has been, and continues to be, developed, including scientific and technical information related to the sources of selenium and its potential adverse impacts on beneficial uses in the Newport Bay watershed. This information was not available at the time Order No. R8-2004-0021 was issued, and much of it has been developed since Order No. R8-2007-0041 was issued. This new information indicates that the final CTR-based effluent limitations may not adequately protect beneficial uses within the Newport Bay watershed. Upon final approval of the Board TMDLs/SSOs, Order No. R8-2007-0041 will be revised to incorporate revised selenium effluent limitations and/or receiving water limitations consistent with the assumptions and requirements of the WLAs contained in the Board TMDLs/SSOs, and this Order will be rescinded. These revised limitations will be (and the interim limitations in this Order are) consistent with anti-backsliding requirements of the Clean Water Act.
19. Given the complexity of the selenium problem and the limited practicable treatment technologies, a collaborative watershed-based approach to reducing selenium provides the best opportunity to achieve water quality objectives for selenium and to assure the protection of beneficial uses. Accordingly, to the extent they seek coverage, this Order requires participation in the NSMP by Dischargers to ensure that waste discharges containing selenium are brought into compliance with the CTR-based selenium effluent limitations in as short of a time period as possible. The NSMP has been structured to allow participation by all dischargers (short- and long-term, current and future) enrolled under Order No. R8-2007-0041.
20. Dischargers who do not seek coverage under this Order shall comply with the final CTR-based effluent limitations for selenium no later than December 20, 2009, as provided in Order No. 2007-0041.
21. The following is a schedule of tasks submitted by the NSMP Working Group that will be completed within the next five years.

| <b>Task No.</b> | <b>Description of Activity</b>   | <b>Compliance Date</b>   |
|-----------------|--|--|
| 1.              | Discharger to elect to participate in the Nitrogen and Selenium Management Program (NSMP). (The Discharger's participation in the NSMP will be deemed to fulfill the general requirements outlined below that are not particular discharger tasks, so long as the discharger remains in material compliance with the terms of an executed NSMP Cooperative Watershed Program Funding Agreement.) | By the later of December 20, 2009 or the commencement of any discharge under Order No. R8-2007-0041. |
| 2.              | NSMP Working Group to develop and submit a Funding Agreement, including funding for offset, mitigation or trading provisions, to provide a consistent source of funding to address point source and nonpoint source discharges of selenium and nitrogen within the watershed.  |  |

| Task No. | Description of Activity   | Compliance Date  |
|----------|---|--|
|          | <p>a. Submit Funding Agreement and then current list of Dischargers participating therein to Regional Water Board</p> <p>b. Execute Funding Agreement</p>   | <p>a. July 1, 2010</p> <p>b. Participating dischargers seeking coverage under this TSO to execute Funding Agreement within 180 days of the participating Discharger's approval of the terms of the submitted Funding Agreement</p> |
| 3.       | <p>All dischargers are required to submit documentation with their notice of intent (NOI) to discharge that the feasibility of eliminating or reducing the volume of the discharge has been evaluated. The feasibility evaluation options will consist of (1) discharge to land; (2) discharge to sewer; and (3) offsite transport and disposal. Specifications and limitations of the three methods were listed in the NSMP report <i>Volume Reducing Best Management Practices for Short-Term Groundwater Related Discharges within Orange County – August 2005</i></p> | Ongoing  |
| 4.       | NSMP Working Group to develop Method of Compliance Workplan/Schedule (BMP Strategic Plan)   |  |

| Task No. | Description of Activity   | Compliance Date   |
|----------|---|---|
|          | <p>a. A proposed BMP Strategic Plan and BMP Effectiveness Monitoring Plan will be developed by the NSMP Working Group for submittal to the Regional Water Board.</p> <p>The BMP Strategic Plan is to include the following elements:</p> <ol style="list-style-type: none"> <li>1. A description of an approach to implement pollution prevention, source control and treatment control BMPs to meet TMDL targets for selenium;</li> <li>2. Identification of BMP implementation priority areas that consider the level of biological significance and selenium concerns;</li> <li>3. Identification of candidate source and/or treatment controls believed important to meet operative TMDL targets, including:               <ol style="list-style-type: none"> <li>a. type and approximate locations of controls;</li> <li>b. timing for implementation;</li> <li>c. treatment capacity;</li> <li>d. cost of implementation; and</li> <li>e. anticipated removal rates and/or load reductions</li> </ol> </li> <li>4. Early Action Tasks anticipated to be completed within 5 years from the date of this Order may include:               <ol style="list-style-type: none"> <li>a. type and approximate locations of controls;</li> <li>b. timing for implementation;</li> <li>c. treatment capacity;</li> <li>d. anticipated removal rates and/or load reductions; and</li> <li>e. study goals and relevance to future projects</li> </ol> </li> <li>5. A BMP Effectiveness Monitoring Program;</li> <li>6. Milestones for Plan review, progress assessment and final selection of source and/or technology controls;</li> <li>7. Final Control Technology Implementation Outline (Phase II)</li> </ol> | <p>a. January 1, 2011</p>   |
|          | b. NSMP Working Group to commence implementation of BMP Strategic Plan  | b. Within 90 days of Regional Water Board approval.                   |
|          | c. NSMP Working Group to submit Annual BMP Strategic Plan implementation progress reports with corresponding decision tree schedule dependent on implementation success and subsequent development of selenium reduction technologies with the goal of implementing BMPs which are reasonably feasible to implement and which have been proven to be effective.   | c. Annually after Regional Water Board Approval of BMP Strategic Plan |
| 5.       | <p>Irrigation Reduction and Control Program</p> <p>Municipal dischargers seeking coverage under this TSO shall adopt an updated Model Water Efficient Landscape Ordinance (A.B. 1881) or one that is "at least as effective as" that Ordinance.</p>   | By the later of January 1, 2010 or as required by A.B 1881.           |
| 6.       | NSMP Working Group to submit and implement Regional Monitoring Program as follows:  |   |

| Task No. | Description of Activity  | Compliance Date   |
|----------|--|---|
|          | a. Regional monitoring program (RMP) for selenium to be submitted to Regional Water Board for approval | a. January 1, 2011  |
|          | b. Commence implementation of monitoring program   | b. Within 90 days of Regional Water Board approval of RMP |
|          | c. Submit annual monitoring reports  | c. Annually after Regional Water Board Approval of RMP    |

The NSMP Working Group will submit to the Regional Water Board on or before each compliance date, the specified document or, if appropriate, a written report detailing compliance or noncompliance with the specific schedule date and task. If noncompliance is being reported, the reasons for such noncompliance will be stated, and will include an estimate of the date when the NSMP will be in compliance. The NSMP will notify the Regional Water Board by letter when it returns to compliance with the time schedule.

22. Enrollment and participation in the NSMP Working Group has been established for Existing Dischargers pursuant to their execution of the NSMP Memorandum of Procedure, or pursuant to their execution and Working Group approval of the First Amendment to Memorandum of Procedure. Future Dischargers wishing to enroll and participate in the NSMP Working Group shall establish their enrollment and participation by execution of a duly approved future amendment to the Memorandum of Procedure as amended by the First Amendment of Procedure.
23. This Order provides interim selenium effluent limitations in lieu of the effluent limitations set forth in Order No. R8-2007-0041. Without these interim limitations, Dischargers' waste discharges after December 20, 2009 threaten to exceed the effluent limitations set forth in Findings 10 and 11 of this Order and, thus, threaten to violate Order No. R8-2007-0041.
24. California Water Code (CWC) section 13300 states: "Whenever a regional board finds that a discharge of waste is taking place or threatening to take place that violates or will violate requirements prescribed by the regional board, or the state board, or that the waste collection, treatment, or disposal facilities of a discharger are approaching capacity, the board may require the discharger to submit for approval of the board, with such modifications as it may deem necessary, a detailed time schedule of specific actions the discharger shall take in order to correct or prevent a violation of requirements."

25. This Order is issued in accordance with CWC section 13300 and establishes a time schedule for compliance.
26. In accordance with CWC section 13385(j)(3), the Regional Water Board finds that each Discharger may not be able to consistently comply with the final effluent limitations for selenium set forth in Order No. R8-2007-0041. These limitations are new requirements that became applicable to Order No. R8-2007-0041 after the effective date of adoption of the waste discharge requirements, and after July 1, 2000, for which new or modified control measures are necessary in order to comply with the limitations, and the new or modified control measures cannot be designed, tested, installed, and put into operation within 30 calendar days.
27. This Order also applies to Future Dischargers (to the extent they seek coverage hereunder) because in many, if not all cases, they contemplated their discharges at a time when the final effluent limitations for selenium as set forth in Order No. R8-2007-0041 were not yet effective.
28. CWC section 13385(h) and (i) require the Regional Water Board to impose mandatory minimum penalties upon dischargers that violate certain effluent limitations. However, CWC section 13385(j) exempts certain violations from the mandatory minimum penalties. CWC section 13385(j)(3) exempts a discharge from mandatory minimum penalties "where the waste discharge is in compliance with either a cease and desist order issued pursuant to CWC section 13301 or a time schedule order issued pursuant to CWC section 13300, if all the [specified] requirements are met."
29. Compliance with this Order exempts the Dischargers from mandatory penalties for violations of the effluent limitation for Total Recoverable Selenium, as set forth in section V.A.1.a of Order No. R8-2007-0041 in accordance with CWC section 13385(j)(3).
30. CWC section 13385(j)(3)(A) requires this Order to specify the actions that the Discharger is required to take in order to correct the potential violations that would otherwise be subject to mandatory minimum penalties. This Order requires the Dischargers to develop and implement new or modified control measures designed to achieve compliance with the effluent limitations as set forth in Findings 10 and 11 of this Order.
31. CWC section 13385(j)(3)(D) requires the preparation and implementation of a pollution prevention plan pursuant to CWC section 13263.3. In order to obtain authorization under Order No. 2007-0041, Dischargers are required to demonstrate that they have documented and made all practicable attempts to avoid, reduce or eliminate the discharge of selenium. The reduction/elimination of selenium discharges may be accomplished through volume reduction, including sewerage. Potential volume reduction measures were evaluated by the NSMP Working Group and three volume reduction BMPs, including sewerage, were

deemed feasible. Selenium occurs in the groundwater-related discharges regulated under Order No. 2007-0041 as the result of additions from natural processes not subject to the control of the Dischargers. Therefore, with respect to the selenium discharges addressed by Order No. 2007-0041, the evaluation and implementation of reasonably feasible discharge volume reduction measures, and the evaluation of and adherence to project design features or other practices that result in discharge avoidance fulfill the requirements of a Pollution Prevention Plan.

32. The interim effluent limitations established by this Order for Existing Dischargers shall be performance-based and set at lowest reasonably feasible historical discharge levels, taking into account precipitation-driven and other sources of variation in selenium concentrations; the interim effluent limitations for Future Dischargers shall also be performance-based and set at the lowest reasonably feasible levels based on consideration of requisite pre-discharge selenium quality characterization and historical selenium discharge levels for similar discharges, taking into account precipitation-driven and other sources of variation in selenium concentrations.
32. Issuance of this Order is exempt from the provisions of the California Environmental Quality Act (Public Resources Code, Section 21000, *et seq.*), in accordance with Section 15321(a)(2), Title 14, California Code of Regulations.
33. Any person adversely affected by this action of the Regional Water Board may petition the State Water Board to review the action. The petition must be received by the State Water Board Office of the Chief Counsel, P.O. Box 100, Sacramento, CA, 95812-0100, within 30 days of the date on which the action was taken. Copies of the law and regulations applicable to filing petitions will be provided on request.

**IT IS HEREBY ORDERED THAT** pursuant to CWC Section 13300 and 13385, the Existing Dischargers listed in this Order and Future Dischargers under Order No. R8-2007-0041 shall comply with the following time schedule to ensure compliance with the final effluent limitations for selenium contained in Order No. R8-2007-0041, and as set forth in Findings 10 and 11 herein.

1. Dischargers seeking coverage under this Order shall elect to participate in the Nitrogen and Selenium Management Program (NSMP) and shall provide to the Executive Officer of the Regional Water Board a copy of the Memorandum of Procedure, as amended, showing Discharger's membership in the Working Group.
2. Dischargers seeking coverage under this Order shall re-certify, as required by their Notice of Intent, that they have documented and made all practicable attempts to avoid, reduce or eliminate the discharge of selenium as required by Section II.A.3 of Order No. R8-2007-0041, within 60 days from the date of this Order, or prior to any discharge under Order No. R8-2007-0041, whichever date is later.

3. Dischargers seeking coverage under this Order shall comply with the following interim effluent limitations for Total Recoverable Selenium during the pendency of this Order; provided the NSMP Working Group is complying with the tasks and process described in Finding 21 during the period of discharge (as established by the Discharger to the satisfaction of the Executive Officer), such Dischargers shall be deemed in compliance with this Order:
  - a. Existing Dischargers shall submit to the Executive Officer for approval, no later than 60 days following the adoption of this Order, a performance-based selenium effluent limitation that is based on historical selenium discharge levels (e.g., the lowest reasonably feasible concentration based on their historical selenium discharges). Upon approval by the Executive Officer, such Discharger must not exceed this interim effluent limitation during the pendency of this Order.
  - b. Future Dischargers shall submit to the Executive Officer for approval, prior to any discharge authorized under Order No. R8-2007-0041, a performance-based effluent limitation for selenium that is based on the requisite pre-discharge characterization of selenium quality and consideration of historical selenium discharge concentrations for similar discharges (e.g., the lowest reasonably feasible concentration based on prior selenium discharges and historical practices, if any, and those of other similarly-situated dischargers). Upon approval by the Executive Officer, such Discharger must not exceed this interim effluent limitation during the pendency of this Order.
4. Dischargers who enroll under Order No. R8-2007-0041 but who do not seek coverage under this Order shall comply with final effluent limitations for selenium by no later than December 20, 2009, as set forth in Order No. R8-2007-0041.
5. If, in the opinion of the Regional Water Board Executive Officer, any Discharger seeking coverage under this Order fails to comply with the provisions of this Order, the Executive Officer may apply to the State Attorney General for judicial enforcement or issue a complaint for Administrative Civil Liability. If compliance with this Order is not achieved, the Discharger would not be exempt from the mandatory minimum penalties for violation of certain effluent limitations, and may be subject to issuance of a Cease and Desist Order in accordance with CWC section 13301.
6. Any person signing a document submitted under this Order shall make the following certification:

*"I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my knowledge and on my inquiry of those individuals*

*immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment."*

7. This Order shall remain in effect for a maximum of five years from the effective date or until such time as Order No. R8-2007-0041 is re-issued or amended to incorporate the revised selenium effluent limitations and/or receiving water limitations that are consistent with the assumptions and requirements of the WLAs contained in the approved Board TMDLs/SSOs.

This Order is effective upon the date of signature.

**December 6, 2013**

**Item: 11**

**Subject: Issuance of Order No. R8-2013-0060**, Amending Time Schedule Order No. R8-2009-0069 for Dischargers Enrolled in Order No. R8-2007-0041, NPDES No. CAG918002, General Discharge Permit for Discharges to Surface Waters of Groundwater Resulting from Groundwater Dewatering Operations and/or Groundwater Cleanup Activities at Sites within the San Diego Creek/Newport Bay Watershed Polluted by Petroleum Hydrocarbons, Solvents, Metals and/or Salts.

**Summary**

Order No. R8-2007-0041 specifies selenium (and other) effluent limitations for groundwater-related discharges in the Newport Bay watershed, and requires compliance with these selenium limitations as soon as possible but no later than December 20, 2009. Time Schedule Order No. 2009-0069 (TSO), issued on December 10, 2009, extended that compliance schedule for a maximum of five years, or no later than December 10, 2014. The TSO remains in effect for a maximum of five years or until such time as Order No. R8-2007-0041 is re-issued to incorporate revised selenium effluent limitations and other requirements necessary to implement Regional Board approved selenium Total Maximum Daily Loads (TMDLs).

The Regional Board incorporated a selenium compliance schedule in Order No. R8-2007-0041 and issued the TSO in recognition of the extraordinary challenge of selenium control in the Newport Bay watershed, the lack of a practicable, conventional selenium treatment technology that could achieve the effluent limitations, significant commitments by watershed stakeholders to identify and implement a selenium management program, and the anticipated re-issuance of Order No. R8-2007-0041 based on TMDLs that were expected to be considered by the Regional Board in 2010 and subsequently approved and effective for regulatory purposes in or about 2012.

While significant progress continues to be made to address selenium in the Newport Bay watershed, it is appropriate to extend the TSO for a maximum of five years, or no later than December 10, 2019. This would extend the date for compliance with the selenium effluent limitations in Order No. R8-2007-0041 to no later than December 10, 2019. This compliance schedule extension is appropriate and justified since there remains no practicable selenium treatment technology that can assure compliance with the effluent limitations, the anticipated selenium TMDLs have not been completed or submitted for requisite approvals, and because there are ongoing and significant efforts to achieve selenium reductions necessary to comply with the TMDLs in advance of their approval.

## Background

Selenium issues in the Newport Bay watershed have a lengthy and complex history, which is summarized in the December 10, 2009 staff report describing the basis for the recommended issuance of TSO No. R8-2009-0069. A copy of that report is attached. Briefly, the salient points include the following:

- In 2002, the U.S. Environmental Protection Agency, Region IX (USEPA) promulgated TMDLs for selenium for the San Diego Creek subwatershed and both Upper and Lower Newport Bay, based primarily on evidence of beneficial use impairment due to exceedances of the applicable California Toxics Rule (CTR) selenium criteria for freshwater and the proximity of Newport Bay to San Diego Creek. The USEPA TMDLs relied heavily on selenium TMDLs then under preparation by Regional Board staff.
- In the Newport Bay watershed, approximately 85% of the selenium load in surface waters originates from groundwater, and much of this load (about 78%) results from diffuse rising groundwater that enters surface waters via springs and seeps in the unlined portions of the channels, and cracks and weepholes in storm drains and the concrete-lined portions of the channels. Discrete, groundwater-related discharges (e.g., groundwater dewatering and cleanup and other regulated discharges (e.g., urban runoff)) account for a relatively small part of the total selenium load to surface waters.
- Controlling sources of selenium in the Newport Bay watershed poses extraordinary challenges given the large scale of the selenium problem, its diffuse origin (largely rising groundwater), the lack of a readily available, conventional treatment technology that can be implemented in a reasonably practicable manner for point source discharges, and, because of extensive urbanization, the limited land available for the placement of potential treatment facilities/BMPs.
- In December 2004, the Regional Board adopted Order No. R8- 2004-0021, NPDES No. CAG998002, General Waste Discharge Requirements for Short-Term Groundwater-Related Discharges and De Minimus Wastewater Discharges to Surface Waters within the San Diego Creek/Newport Bay Watershed. Order No. R8-2004-0021 established selenium effluent limitations for these discharges for the first time. The limitations were based on the CTR selenium criteria.
- Because there was no conventional treatment technology available to point source dischargers and immediate compliance with the selenium effluent limitations in Order No. R8-2004-0021 was thus infeasible for many dischargers, Order No. R8-2004-0021 specified a compliance schedule for the selenium effluent limitations. That schedule required compliance as soon as possible but no later than December 20, 2009.
- Numerous watershed stakeholders remained concerned about the ability to comply with the selenium effluent limitations, even with the five-year compliance schedule, given the lack of practicable selenium treatment technology. The stakeholders also expressed concern about the validity and effectiveness of the CTR criteria for the protection of biological resources in the watershed. These considerations prompted

the formation of a voluntary program known as the Nitrogen and Selenium Management Program (NSMP), sponsored by the NSMP Working Group. The Working Group includes many stakeholders in the watershed. The Working Group proposed to develop and implement upon Regional Board approval a five-year Work Plan designed to: evaluate and recommend refinements to the USEPA selenium TMDLs; to evaluate potential selenium treatment technologies; recommend a comprehensive TMDL implementation plan for the management of selenium; and, support development of recommendations for selenium site-specific objectives for the watershed that would supplant the CTR criteria.

- Order No. R8-2004-0021 included requirements based on the NSMP Work Plan approach. The five-year Work Plan was approved and, with significant commitments of NSMP Working Group resources, has been implemented. The tasks completed include the evaluation of potential selenium treatment technologies, including pilot, demonstration-scale testing of selected technologies, the development of recommendations for site-specific objectives for selenium for the Newport Bay watershed, and recommendations for a selenium management strategy that could be incorporated in the revised TMDL implementation plan.
- As part of a permit streamlining effort, the Regional Board adopted Order No. R8-2007-0041 on November 20, 2007. Order No. R8-2007-0041 replaced Order No. R8-2004-0021, and Order No. R8-2004-0021 has been rescinded. Order No. R8-2007-0041 expired on November 1, 2012 but was administratively extended.
- Like Order No. R8-2004-0021, Order No. R8-2007-0041 regulates groundwater-related discharges and also includes requirements for discharges from groundwater cleanup operations in the Newport Bay watershed. Order No. R8-2007-0041 includes the same requirements for selenium as specified in Order No. R8-2004-0021 and continues to require compliance with selenium limitations as soon as possible but no later than December 20, 2009.
- On December 10, 2009, the Regional Board approved Time Schedule Order (TSO) No. R8-2009-0069 for dischargers enrolled in Order No. R8-2007-0041. TSO No. R8-2009-0069 extended the schedule for compliance with selenium effluent limitations specified in Order No. R8-2007-0041 from December 20, 2009 to no later than December 10, 2014. As issued on December 10, 2009, the TSO remains in effect for a maximum of five years (i.e., December 10, 2014) or until such time as Order No. R8-2007-0041 is re-issued to incorporate revised selenium effluent limitations and other requirements necessary to implement Regional Board approved selenium Total Maximum Daily Loads (TMDLs).
- The TSO required dischargers regulated under Order No. R8-2007-0041 to participate in the NSMP and to participate in the completion of specific selenium-related tasks identified by the NSMP Working Group. These tasks included the submittal of a proposed Method of Compliance Workplan/Schedule, or "BMP Strategic Plan", and a proposed regional monitoring program (RMP). The TSO required that the BMP Strategic Plan and RMP be implemented within 90 days of Regional Board approval. Both the BMP Strategic Plan and RMP were approved on December 5, 2013 and are being implemented.

- The approved BMP Strategic Plan includes selenium reduction projects (Cienega Demonstration Project, the Peters Canyon Wash Pipeline Project, the Santa Ana-Delhi Channel Diversion Project), continued evaluation of potential selenium treatment technologies, and adaptive management of selenium control implementation based on the results of monitoring of BMP efficacy and the effects of selenium control implementation on the receiving waters.

## Discussion

The Regional Board found issuance of TSO No. R8-2009-0069 appropriate and necessary in light of the extraordinary complexity of the selenium problem in the Newport Bay watershed, the lack of a readily available, conventional selenium treatment technology that could be implemented in a reasonably practicable manner so as to achieve compliance with selenium effluent limitations, and the significant commitments by the members of the NSMP Working Group to assess and achieve selenium standards and effluent limitations.

In issuing the TSO, the Regional Board also recognized that implementation of the tasks specified in the TSO would support ongoing Regional Board staff efforts to develop revised selenium TMDLs and site-specific objectives (SSOs) for the Newport Bay watershed, and that those TMDLs/SSOs would, when approved, serve as the basis for appropriate revisions to the selenium limitations and schedule for compliance with those limitations that are specified in Order No. R8-2007-0041. The Regional Board anticipated that the revised TMDLs/SSOs would be recommended for approval in 2010 and that final approval by all requisite agencies would occur in a subsequent one to two year period. The Regional Board found that issuance of the TSO would provide appropriate compliance schedule relief until such time as the TMDLs/SSOs could be fully approved and appropriate permit revisions could be made, and further, that such an approach would be a prudent use of the Regional Board's permit issuance resources.

While significant effort and progress to address selenium in the Newport Bay watershed has been and continues to be made, the TMDL/SSO adoption process has been delayed. In fact, in light of anticipated difficulty in the approval of selenium SSOs, and in the interest of establishing TMDLs that can serve as the basis of permit revisions in a more timely manner, Regional Board staff, in collaboration with the NSMP Working Group and other stakeholders, is now pursuing selenium SSOs on a parallel but separate path from the TMDLs. It is now anticipated that selenium TMDLs will be recommended for Regional Board approval by the end of 2014. It is expected that the selenium SSO recommendations will follow shortly thereafter. It should be noted that the recommended TMDLs will take the likely SSO recommendations into account.

Meanwhile, the NSMP Working Group and other stakeholders in the Newport watershed continue to conduct technical investigations to support TMDL and SSO development, to evaluate potential selenium treatment technologies, and to identify and implement

measures to control selenium inputs to surface waters in the Newport watershed. As stated above, these actions are part of the approved BMP Strategic Plan required by the TSO. In particular, certain stakeholders have implemented or are in the process of implementing significant selenium (and nitrogen) reduction projects. These include ongoing operation of the Cienega Demonstration Project (a selenium and nitrogen treatment project), the Peters Canyon Wash Diversion Project, and the Santa Ana-Delhi Channel Diversion Project. Upon implementation of these diversion projects, dry weather flows containing significant selenium (and nitrogen) loads will be diverted from these channels to the Orange County Sanitation District sewer system.

In light of the unanticipated delay in the development and approval of selenium TMDLs for the Newport Bay watershed, the continuing lack of practicable selenium treatment technology (despite intensive efforts to identify and evaluate such technology) and the ongoing and very significant commitments by NSMP Working Group members to implement selenium reduction projects that will result in substantial selenium (and nitrogen) reductions in advance of TMDL approval, Regional Board staff recommends that TSO No. R8-2009-0069 be amended to further extend the date for compliance with the selenium effluent limitations. Specifically, Regional Board staff recommends that the TSO be amended to remain effective for a maximum of five years beyond the current expiration date, or December 10, 2019, or until Order No. 2007-0041 is re-issued to incorporate revised selenium effluent limitations and other requirements that are consistent with approved selenium TMDLs. As stated above, it is anticipated that selenium TMDLs that would replace those promulgated by USEPA in 2002 will be recommended for Regional Board adoption by the end of 2014. Regional Board staff intends to work closely with State Water Board, USEPA and other agency staff to assure that the recommended TMDLs will be approvable. The requisite approval process subsequent to Regional Board action is expected to take one to two years.

Once the TMDLs have been approved, appropriate revisions to the requirements in Order No. R8-2007-0041, including a compliance schedule based on that identified in the approved TMDL, will be recommended for Regional Board consideration. Extending the TSO would obviate the need for more immediate action on Order No. R8-2007-0041 and thus conserve the Board's limited permit issuance resources until they would be most effectively utilized.

California Water Code (CWC) Section 13385(j)(3)(C)(ii)(II) provides that following a public hearing, and upon a showing that the discharger is making diligent progress towards bringing the waste discharge into compliance with the effluent limitation, the regional board may extend the time schedule specified in a time schedule order issued to that discharger for an additional period not exceeding five years, if the discharger demonstrates that the additional time is necessary to comply with the effluent limitation.

As described above, the dischargers enrolled in Order No. R8-2007-0041 are making diligent progress toward bringing waste discharges into compliance with selenium effluent limitations and have demonstrated that additional time is necessary to achieve

that compliance. Therefore, per CWC section 13385(j)(3)(C)(ii)(II), it is appropriate to extend the TSO by no more than five years. No other changes to the TSO are necessary.

### **RECOMMENDATION**

Adopt Order No. R8-2013-0060, amending Time Schedule Order No. R8-2009-0069 as presented.

Attachment: Staff report for TSO No. 2009-0069 (December 10, 2009)

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD  
SANTA ANA REGION

ORDER NO. R8-2013-0060  
AMENDING TIME SCHEDULE ORDER NO. R8-2009-0069

For

DISCHARGERS ENROLLED IN ORDER NO. R8 -2007-0041, NPDES NO. CAG918002, GENERAL DISCHARGE PERMIT FOR DISCHARGES TO SURFACE WATERS OF GROUNDWATER RESULTING FROM GROUNDWATER DEWATERING OPERATIONS AND/OR GROUNDWATER CLEANUP ACTIVITIES AT SITES WITHIN THE SAN DIEGO CREEK/NEWPORT BAY WATERSHED POLLUTED BY PETROLEUM HYDROCARBONS, SOLVENTS, METALS AND/OR SALTS.

The California Regional Water Quality Control Board, Santa Ana Region (hereinafter Board) finds that:

1. On December 10, 2009, the Board adopted Time Schedule Order (TSO) No. R8-2009-0069 for dischargers enrolled in Order No. R8-2007-0041, NPDES No. CAG918002, General Discharge Permit for Discharges to Surface Waters of Groundwater Resulting from Groundwater Dewatering Operations and/or Groundwater Cleanup Activities at Sites within the San Diego Creek/Newport Bay Watershed Polluted by Petroleum Hydrocarbons, Solvents, Metals and/or Salts. Order No. R8-2007-0041 expired on November 1, 2012 but was administratively extended.
2. TSO No. R8-2009-0069 (the TSO) extended the schedule for final compliance with the effluent limitations for selenium specified in Order No. R8-2007-0041 for a maximum of five years from the date of adoption of the TSO, or no later than December 10, 2014. The compliance date for these limitations specified in Order No. 2007-0041 was no later than December 20, 2009.
3. Issuance of the TSO was appropriate and necessary given the extraordinary challenge of controlling sources of selenium in the Newport Bay watershed and the lack of a readily available conventional treatment technology that could be implemented in a reasonably practicable manner so as to achieve immediate compliance with selenium effluent limitations.
4. The TSO established interim requirements, including the requirement that the dischargers enrolled in Order No. R8-2007-0041 ("Dischargers") shall elect to participate in the Nitrogen and Selenium Management Program (NSMP) and thereby fulfill a schedule of specific tasks submitted by the NSMP Working Group. This schedule of tasks is identified in the TSO.

5. Dischargers enrolled in the TSO have complied with the TSO by participation in the NSMP and the completion of the tasks identified by the NSMP Working Group and specified in the TSO. The tasks included the submittal of a proposed Method of Compliance Workplan/Schedule, or "BMP Strategic Plan"<sup>1</sup>, and a proposed regional monitoring program (RMP) for selenium. TSO No. R8-2009-0069 requires that both the BMP Strategic Plan and the Regional Monitoring Program be implemented by the NSMP Working Group within 90 days of their approval by the Regional Board.
6. A draft BMP Strategic Plan was submitted on January 1, 2011. A draft Regional Monitoring Program was submitted on January 3, 2011. These proposed plans were subsequently revised based on comments from Regional Board staff and re-submitted. The revised BMP Strategic Plan, dated September 27, 2013, includes a revised Regional Monitoring Program. The revised Plan, including the RMP, was submitted on October 10, 2013. The revised Plan, including the RMP, was further revised and re-submitted on December 4, 2013. Both plans were approved by the Regional Board's Executive Officer on December 5, 2013.
7. The approved BMP Strategic Plan identifies a three-phase approach to achieve compliance with selenium effluent limitations specified for the groundwater-related discharges regulated under Order No. R8-2007-0041 (and for groundwater dewatering discharges by the City of Irvine that are regulated under Order No. R8-2005-0079). The Strategic Plan includes selenium reduction projects, including the Cienega Field Demonstration Project, the Peters Canyon Wash Pipeline Project and the Santa Ana-Delhi Channel Diversion Project. The Cienega Field Demonstration Project is already in operation, while significant progress to implement the other selenium reduction projects within the next five years is being made by members of the NSMP Working Group and other dischargers. The approved BMP Strategic Plan also includes continued evaluation of potential selenium treatment technologies and adaptive management of selenium control implementation based on the results of monitoring of BMP efficacy and the effects of selenium control implementation on the receiving waters. The Strategic Plan also includes commitments to participate with the Regional Board in the development of selenium site-specific objectives and

---

<sup>1</sup> The NSMP was formed in response to the adoption of Order No. R8-2004-0021, NPDES No. CAG998002, General Waste Discharge Requirements for Short-Term Groundwater-Related Discharge and De Minimus Wastewater Discharges to Surface Waters within the San Diego Creek/Newport Bay Watershed. Order No. R8-2004-0021 specified selenium limitations for these discharges for the first time. Because no conventional treatment technology was available to achieve immediate compliance with these limitations, Order No. R8-2004-0021 specified a schedule of compliance for these limitations. Responsible parties formed the NSMP Working Group to develop and implement a 5-year workplan designed, in part, to evaluate, develop and make recommendations for the implementation of selenium treatment technologies and other control measures that would enable compliance and achieve applicable water quality standards. As part of the implementation of this 5-year workplan, the NSMP Working Group developed and proposed a BMP Strategic Plan. This proposed Plan is distinct from the BMP Strategic Plan required under the TSO, although it formed the substantive basis for and includes many of the same elements as the Plan required and later submitted under the TSO.

revised selenium TMDLs for the Newport Bay watershed that would supplant the selenium TMDLs promulgated by the U.S. Environmental Protection Agency in 2002.

8. In addition to the development of the draft BMP Strategic Plans and RMPs and significant, costly and complicated multi-agency efforts to implement the Peters Canyon Wash Pipeline Project and other selenium reduction projects, the NSMP Working Group has been actively engaged in selenium-related technical and scientific investigations in the Newport Bay watershed. The intent of these investigations is to support Regional Board staff work to develop revised selenium TMDLs for the Newport Bay watershed. In addition, the investigations are intended to support recommendations for site-specific objectives for selenium for this watershed.
9. The selenium reduction projects that are included in the approved BMP Strategic Plan are expected to remove certain point source selenium discharges to surface waters, including discharges by the City of Irvine (certain groundwater dewatering discharges) and Caltrans (Groundwater Dewatering Facility). In addition, the projects will intercept and divert to the Orange County Sanitation District sewer system diffuse rising/seeping groundwater that contains selenium and that otherwise enters the surface water system. These diffuse groundwater discharges are not presently regulated. Selenium reductions as the result of the diversion projects are expected to be significantly greater than the sum of all remaining selenium loads from other point source dewatering and groundwater cleanup discharges during dry weather.
10. As such, the projects are expected to contribute significantly to the selenium reductions anticipated to be required by the revised selenium TMDLs, and the reductions may or will likely be achieved before the revised selenium TMDLs are approved and become effective for regulatory purposes. The diversion projects are also expected to result in significant reductions in nitrogen discharges to surface waters and thereby contribute to compliance with the Nutrient TMDL established for the San Diego Creek/Newport Bay watershed in 1998.
11. When the TSO was adopted on December 10, 2009, the Board anticipated that revised selenium TMDLs would be considered by the Regional Board in early 2010 and that subsequent, requisite approval of the TMDLs by the State Water Board, Office of Administrative Law and USEPA would follow thereafter in a timely manner. The approval process by these other agencies was anticipated to require at least one and more likely two years. It was recognized that upon final approval, the new TMDLs would be used as the basis for modifications to Order No. R8-2007-0041, including revised selenium effluent limitations and schedules for compliance with these limitations. Order No. R8-2007-0041 was administratively extended, rather than revised and re-issued upon its expiration, given these circumstances and to conserve Regional Board staff resources.

12. Pursuant to the terms of the TSO, the TSO remains in effect for a maximum of five years from its effective date, or December 10, 2014, or until such time as Order No. R8-2007-0041 is re-issued or amended to incorporate revised selenium effluent limitations and/or receiving water limitations that are consistent with the assumptions and requirements of the wasteload allocations contained in Board-approved TMDLs.
13. While, as described in the preceding findings, significant efforts have been and continue to be made by the Dischargers and other members of the NSMP Working Group to develop revised TMDLs and to identify and implement selenium reductions to achieve compliance with selenium effluent limitations, it is recognized that substantive additional work is necessary to achieve these goals. It is anticipated that revised TMDLs will be recommended for adoption by the Regional Board by the end of 2014. A one to two year period thereafter is expected to be necessary to obtain all requisite agency approvals, whereupon the TMDLs would become effective and serve as the basis for revisions to Order No. R8-2007-0041.
14. Concurrent with work to develop and pursue approval of the revised TMDLs, the Dischargers, with other members of the NSMP Working Group, are required to implement the approved BMP Strategic Plan (dated December 4, 2013). This is expected to result in significant reductions in selenium discharges in the Newport Bay watershed, even though specific wasteload and load allocations applicable to these discharges will not become effective for regulatory purposes until the TMDLs receive all requisite approvals.
15. California Water Code (CWC) Section 13385(j)(3)(C)(ii)(II) provides that following a public hearing, and upon a showing that the discharger is making diligent progress towards bringing the waste discharge into compliance with the effluent limitation, the regional board may extend the time schedule specified in a time schedule order issued to that discharger for an additional period not exceeding five years, if the discharger demonstrates that the additional time is necessary to comply with the effluent limitation.
16. As described in the preceding findings, the Dischargers are making diligent progress toward bringing waste discharges into compliance with selenium effluent limitations and have demonstrated that additional time is necessary to achieve that compliance. Per CWC section 13385(j)(3)(C)(ii)(II), it is appropriate to extend the TSO by no more than two years, i.e., to no later than December 10, 2016. The extension will allow the completion of work necessary to complete revised selenium TMDLs and to re-issue Order No. R8-2007-0041 to incorporate revised effluent limitations and other requirements necessary to implement the new TMDLs. No other changes to the TSO are necessary.
17. Issuance of this amendment to the TSO is exempt from the provision of the California Environmental Quality Act (Public Resources Code, Section 21000, *et*

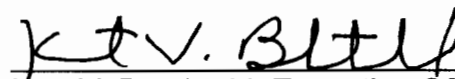

seq.), in accordance with Section 15321(a)(2), Title 14, California Code of Regulations.

18. Any person adversely affected by this action of the Regional Water Board may petition the State Water Board to review the action. The petition must be received by the State Water Board Office of the Chief Counsel, P.O. Box 100, Sacramento, CA, 95812-0100, within 30 days of the date on which the action was taken. Copies of the law and regulations applicable to filing petitions will be provided on request. Information regarding the petition process may also be found at the State Water Board website:  
[http://www.waterboards.ca.gov/public\\_notices/petitions/water\\_quality/index.shtml](http://www.waterboards.ca.gov/public_notices/petitions/water_quality/index.shtml).

**IT IS HEREBY ORDERED THAT:**

1. Time Schedule Order No. R8-2009-0069 shall be extended for up to an additional two years, as set forth in Attachment 1, which includes the following amendment:  
  
"7. This Order, as amended by Order No. R8-2013-0060 on December 6, 2013, shall remain in effect for a maximum of two years from its current expiration date, or until December 10, 2016, or until such time as Order No. R8-2007-0041 is re-issued to incorporate revised selenium effluent limitations and other requirements necessary to implement Board approved selenium TMDLs."
2. All other terms and conditions of Time Schedule Order No. R8-2009-0069, as amended, remain in full force and effect.

This Order is effective upon the date of signature.

  
Kurt V. Berchtold, Executive Officer

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD  
SANTA ANA REGION

TIME SCHEDULE ORDER NO. R8-2009-0069

For

DISCHARGERS ENROLLED UNDER ORDER NO. R8-2007-0041, NPDES NO. CAG918002,  
GENERAL DISCHARGE PERMIT FOR DISCHARGES TO SURFACE WATERS OF  
GROUNDWATER RESULTING FROM GROUNDWATER DEWATERING OPERATIONS  
AND/OR GROUNDWATER CLEANUP ACTIVITIES AT SITES WITHIN THE SAN DIEGO  
CREEK/NEWPORT BAY WATERSHED POLLUTED BY PETROLEUM HYDROCARBONS,  
SOLVENTS, METALS AND/OR SALTS

As amended by Order No. R8-2013-0060 on December 6, 2013

The California Regional Water Quality Control Board, Santa Ana Region (Regional Water Board), finds that:

1. In May 2000, the United States Environmental Protection Agency (USEPA) promulgated what is known as the California Toxics Rule (CTR), which consists of numeric water quality criteria for priority toxic pollutants and other water quality standards provisions to be applied to waters in the State of California (State). (See 40 C.F.R. 131.38.) USEPA promulgated the CTR based on a determination that the numeric criteria are necessary to protect human health and the environment. The CTR contains a numeric chronic aquatic life criterion for selenium in freshwater of 5 micrograms per liter (5 µg/L), as total recoverable selenium, and in saltwater of 71 µg/L, as total dissolved selenium. (40 C.F.R. 131.38(b)(1).)
2. The CTR provides the State with discretion in how to implement the relevant criteria. Accordingly, in March 2000, the State Water Resources Control Board ("State Water Board") adopted the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (SIP). The State Water Board amended the SIP in February 2005 with Resolution No. 2005-0019. USEPA has approved the SIP for use as the State's implementation plan for CTR constituents.
3. On June 14, 2002, USEPA promulgated Total Maximum Daily Loads (TMDLs) for Toxic Pollutants in San Diego Creek and Newport Bay. TMDLs were established for organochlorine compounds, organophosphate pesticides, metals (chromium, cadmium, mercury, copper, lead and zinc) and selenium.
4. The USEPA TMDLs established waste load allocations (WLAs) for discharges of groundwater to surface water for selenium based on the CTR chronic criteria for selenium in freshwater and saltwater. However, USEPA's TMDLs are not self-executing, contain no implementation plan, and have not been incorporated into the Basin Plan for the Santa Ana Region. Neither the State nor Regional Water Board has developed an implementation plan for the USEPA TMDLs.

5. On December 20, 2004, the Regional Water Board adopted General Waste Discharge Requirements for Short-Term Groundwater-Related Discharges and De Minimis Wastewater Discharges to Surface Waters within the San Diego Creek/Newport Bay Watershed, Order No. R8-2004-0021, NPDES No. CAG998002. Pursuant to the SIP, the Regional Water Board incorporated numeric selenium effluent limits based on the CTR chronic freshwater and saltwater aquatic life criteria into Order No. R8-2004-0021, with a compliance schedule requiring compliance with the final effluent limits to be achieved no later than December 20, 2009. As interim compliance measures, Order No. R8-2004-0021 allowed for compliance with the selenium effluent limitations through either an approved offset program or participation in the Nitrogen and Selenium Management Program [NSMP] prior to the December 20, 2009 date.
6. On October 13, 2006, the Regional Water Board adopted Order No. R8-2006-0065, which amended the type and nature of discharges authorized under Order No. R8-2004-0021.
7. On November 30, 2007, the Regional Water Board adopted Order No. R8-2007-0041, NPDES No. CAG918002. Order No. R8-2007-0041 is a general permit that regulates discharges of treated wastewater from groundwater dewatering and/or groundwater remediation activities at sites polluted by petroleum hydrocarbons, solvents, metals and/or salts within the San Diego Creek/Newport Bay watershed. Consistent with Order No. R8-2004-0021, Order No. R8-2007-0041 required compliance with final effluent limits based on the CTR chronic criteria for selenium by no later than December 20, 2009. Order No. R8-2007-0041 has replaced Order No. R8-2004-0021, and Order No. R8-2004-0021 has been rescinded.
8. Order No. R8-2007-0041 was later amended by Order No. R8-2009-0045, which was adopted by the Regional Water Board on July 20, 2009. Order No. R8-2009-0045 amended Order No. R8-2007-0041 by expanding and clarifying the nature of the discharges allowed under Order No. R8-2007-0041.
9. As of the date of this Order, the following entities are enrollees under Order No. R8-2007-0041 ("Existing Dischargers"):

| <u>Enrollees</u>                      | <u>Facility</u>                   | <u>Effective Date</u> |
|---------------------------------------|-----------------------------------|-----------------------|
| Ca Dept of Transportation District 12 | Dewatering-Irvine-Various-Newport | 6/14/2005             |
| Irvine Company                        | Dewatering, General               | 12/20/2004            |
| Newport Beach City                    | Dewatering, General               | 9/24/1998             |

Entities that enroll under Order No. R8-2007-0041 after the effective date of this Order are referred to as "Future Dischargers." Any entity that enrolls under Order No. R8-2007-0041 is a "Discharger." Although listed above as an Existing Discharger, the City of Irvine, and potentially others, is not presently discharging under Order No. R8-2007-0041 and the City of Irvine has no present intention of discharging thereunder for the foreseeable future.

10. Section V.A.1.a of Order No. R8-2007-0041 contains final effluent limitations based on CTR criteria for total recoverable selenium for discharges to San Diego Creek and its tributaries at the following levels: (1) the maximum daily concentration limit ( $\mu\text{g/L}$ ) is 8.2; and (2) the average monthly concentration limit ( $\mu\text{g/L}$ ) is 4.1.
11. Section V.A.1.a of Order No. R8-2007-0041 contains final effluent limitations based on CTR criteria for total recoverable selenium for discharges to Upper and Lower Newport Bay at the following levels: (1) the maximum daily concentration limit ( $\mu\text{g/L}$ ) is 116; and (2) the average monthly concentration limit ( $\mu\text{g/L}$ ) is 58.
12. Section V.A.1.b of Order No. R8-2007-0041 provides that compliance with the selenium effluent limitations specified in Section V.A.1.a shall be achieved as soon as possible but no later than December 20, 2009.
13. In response to Order No. R8-2004-0021, many of the San Diego Creek/Newport Bay watershed stakeholders/dischargers established a Nitrogen and Selenium Management Program (NSMP) Working Group. The NSMP Working Group includes representatives from local governments and agencies, developers and other private entities, water districts, State agencies including the Regional Water Board, and environmental groups.
14. Order No. R8-2004-0021 required the NSMP Working Group to develop a work plan to assist in identifying a comprehensive management plan for selenium and nitrogen and, in particular, to identify an approach to address rising groundwater, the largest source of selenium in the watershed. The NSMP Work Plan and

Compliance Strategy (Work Plan) was approved by the Executive Officer of the Regional Water Board in July 2005. The Working Group has been implementing the approved Work Plan since July 2005.

15. The NSMP Work Plan included a number of selenium-related tasks, including the development of a conceptual model for selenium, an evaluation of selenium sources and loads, an assessment of the bioavailability and impacts of selenium on beneficial uses in the watershed, an evaluation of selenium speciation analytical methods, an evaluation and selection of potentially viable Best Management Practices (BMPs) and treatment technologies for selenium, pilot testing of the most promising BMPs/treatment technologies, and, if necessary and/or appropriate, the development of site-specific objectives (SSOs) for selenium.
16. Controlling sources of selenium in the Newport Bay watershed poses extraordinary challenges given the watershed-wide scale of the selenium problem, its diffuse origin (largely rising groundwater) and the limited land available for placement of treatment facilities and BMPs because of the high degree of urbanization in the watershed. In addition, there is currently no readily available, conventional treatment technology that can be implemented in a reasonably practicable manner for point source discharges. In the Newport Bay watershed, approximately 85% of the existing selenium loads in surface waters originates from groundwater, and much of this load (about 78%) results from diffuse rising groundwater, which enters surface waters via springs and seeps in the unlined portions of the channels, and cracks and weepholes in storm drains and the concrete-lined portions of the channels. Discrete, groundwater-related discharges (e.g., groundwater dewatering and cleanup) and other regulated discharges (e.g., urban runoff) account for a relatively small part of the selenium load to surface waters. Therefore, selenium reductions needed to protect beneficial uses are best achieved on a regional, watershed-wide scale, addressing both non-point and point sources.
17. At this time, Regional Water Board staff, in collaboration with the NSMP Working Group, is developing TMDLs and SSOs for selenium in the Newport Bay watershed<sup>1</sup> to be presented for consideration by the Regional Water Board in early 2010 (the "Board TMDLs/SSOs"). Once approved, the SSOs will replace the CTR criteria for the relevant water bodies. As currently designed, implementation of the

---

<sup>1</sup> The Newport Bay watershed encompasses both upper and lower Newport Bay and its tributaries, San Diego Creek, Santa Ana Delhi, and Big Canyon subwatersheds, and the Costa Mesa and Santa Isabel channels. To date, NPDES permits, TMDLs and amendments to the Basin Plan for the Santa Ana Region have referred to the watershed as the "San Diego Creek/Newport Bay" watershed. However, the County of Orange recently performed a comprehensive evaluation of all the watersheds located within their boundaries with the intent of verifying watershed divisions and nomenclature. The County decided that the San Diego Creek/Newport Bay watershed would simply be referred to as the Newport Bay watershed. All of the County programs, including the NPDES program, and all County documents now refer to the Newport Bay watershed. For consistency with the new nomenclature, these TMDLs/SSOs will also refer to the watershed as the Newport Bay watershed. Similarly, future NPDES permits will employ this nomenclature.

Board TMDLs/SSOs will involve a collaborative watershed-based approach coordinated by and through the NSMP Working Group.

18. Through development of the Board TMDLs/SSOs and the NSMP, considerable new information has been, and continues to be, developed, including scientific and technical information related to the sources of selenium and its potential adverse impacts on beneficial uses in the Newport Bay watershed. This information was not available at the time Order No. R8-2004-0021 was issued, and much of it has been developed since Order No. R8-2007-0041 was issued. This new information indicates that the final CTR-based effluent limitations may not adequately protect beneficial uses within the Newport Bay watershed. Upon final approval of the Board TMDLs/SSOs, Order No. R8-2007-0041 will be revised to incorporate revised selenium effluent limitations and/or receiving water limitations consistent with the assumptions and requirements of the WLAs contained in the Board TMDLs/SSOs, and this Order will be rescinded. These revised limitations will be (and the interim limitations in this Order are) consistent with anti-backsliding requirements of the Clean Water Act.
19. Given the complexity of the selenium problem and the limited practicable treatment technologies, a collaborative watershed-based approach to reducing selenium provides the best opportunity to achieve water quality objectives for selenium and to assure the protection of beneficial uses. Accordingly, to the extent they seek coverage, this Order requires participation in the NSMP by Dischargers to ensure that waste discharges containing selenium are brought into compliance with the CTR-based selenium effluent limitations in as short of a time period as possible. The NSMP has been structured to allow participation by all dischargers (short- and long-term, current and future) enrolled under Order No. R8-2007-0041.
20. Dischargers who do not seek coverage under this Order shall comply with the final CTR-based effluent limitations for selenium no later than December 20, 2009, as provided in Order No. 2007-0041.
21. The following is a schedule of tasks submitted by the NSMP Working Group that will be completed within the next five years.

| Task No. | Description of Activity  | Compliance Date   |
|----------|--|---|
| 1.       | Discharger to elect to participate in the Nitrogen and Selenium Management Program (NSMP). (The Discharger's participation in the NSMP will be deemed to fulfill the general requirements outlined below that are not particular discharger tasks, so long as the discharger remains in material compliance with the terms of an executed NSMP Cooperative Watershed Program Funding Agreement.)   | By the later of December 20, 2009 or the commencement of any discharge under Order No. R8-2007-0041.  |
| 2.       | NSMP Working Group to develop and submit a Funding Agreement, including funding for offset, mitigation or trading provisions, to provide a consistent source of funding to address point source and nonpoint source discharges of selenium and nitrogen within the watershed.  |   |
|          | a. Submit Funding Agreement and then current list of Dischargers participating therein to Regional Water Board<br><br>b. Execute Funding Agreement   | a. July 1, 2010<br><br>b. Participating dischargers seeking coverage under this TSO to execute Funding Agreement within 180 days of the participating Discharger's approval of the terms of the submitted Funding Agreement |
| 3.       | All dischargers are required to submit documentation with their notice of intent (NOI) to discharge that the feasibility of eliminating or reducing the volume of the discharge has been evaluated. The feasibility evaluation options will consist of (1) discharge to land; (2) discharge to sewer; and (3) offsite transport and disposal. Specifications and limitations of the three methods were listed in the NSMP report <i>Volume Reducing Best Management Practices for Short-Term Groundwater Related Discharges within Orange County – August 2005</i> | Ongoing   |
| 4.       | NSMP Working Group to develop Method of Compliance Workplan/Schedule (BMP Strategic Plan)  |   |

| Task No.  | Description of Activity   | Compliance Date  |
|-----------|---|--|
|           | <p>a. A proposed BMP Strategic Plan and BMP Effectiveness Monitoring Plan will be developed by the NSMP Working Group for submittal to the Regional Water Board.</p> <p>The BMP Strategic Plan is to include the following elements:</p> <ol style="list-style-type: none"> <li>1. A description of an approach to implement pollution prevention, source control and treatment control BMPs to meet TMDL targets for selenium;</li> <li>2. Identification of BMP implementation priority areas that consider the level of biological significance and selenium concerns;</li> <li>3. Identification of candidate source and/or treatment controls believed important to meet operative TMDL targets, including:                             <ol style="list-style-type: none"> <li>a. type and approximate locations of controls;</li> <li>b. timing for implementation;</li> <li>c. treatment capacity;</li> <li>d. cost of implementation; and</li> <li>e. anticipated removal rates and/or load reductions</li> </ol> </li> <li>4. Early Action Tasks anticipated to be completed within 5 years from the date of this Order may include:                             <ol style="list-style-type: none"> <li>a. type and approximate locations of controls;</li> <li>b. timing for implementation;</li> <li>c. treatment capacity;</li> <li>d. anticipated removal rates and/or load reductions; and</li> <li>e. study goals and relevance to future projects</li> </ol> </li> <li>5. A BMP Effectiveness Monitoring Program;</li> <li>6. Milestones for Plan review, progress assessment and final selection of source and/or technology controls;</li> <li>7. Final Control Technology Implementation Outline (Phase II)</li> </ol> | <p>a. January 1, 2011</p>  |
|           | <p>b. NSMP Working Group to commence implementation of BMP Strategic Plan</p>   | <p>b. Within 90 days of Regional Water Board approval.</p>                   |
|           | <p>c. NSMP Working Group to submit Annual BMP Strategic Plan implementation progress reports with corresponding decision tree schedule dependent on implementation success and subsequent development of selenium reduction technologies with the goal of implementing BMPs which are reasonably feasible to implement and which have been proven to be effective.</p>  | <p>c. Annually after Regional Water Board Approval of BMP Strategic Plan</p> |
| <p>5.</p> | <p><b>Irrigation Reduction and Control Program</b><br/>                     Municipal dischargers seeking coverage under this TSO shall adopt an updated Model Water Efficient Landscape Ordinance (A.B. 1881) or one that is "at least as effective as" that Ordinance.</p>  | <p>By the later of January 1, 2010 or as required by A.B 1881.</p>           |
| <p>6.</p> | <p>NSMP Working Group to submit and implement Regional Monitoring Program as follows:</p>   |  |

| <b>Task No.</b> | <b>Description of Activity</b>   | <b>Compliance Date</b>                                    |
|-----------------|--|---|
|                 | a. Regional monitoring program (RMP) for selenium to be submitted to Regional Water Board for approval | a. January 1, 2011  |
|                 | b. Commence implementation of monitoring program   | b. Within 90 days of Regional Water Board approval of RMP |
|                 | c. Submit annual monitoring reports  | c. Annually after Regional Water Board Approval of RMP    |

The NSMP Working Group will submit to the Regional Water Board on or before each compliance date, the specified document or, if appropriate, a written report detailing compliance or noncompliance with the specific schedule date and task. If noncompliance is being reported, the reasons for such noncompliance will be stated, and will include an estimate of the date when the NSMP will be in compliance. The NSMP will notify the Regional Water Board by letter when it returns to compliance with the time schedule.

22. Enrollment and participation in the NSMP Working Group has been established for Existing Dischargers pursuant to their execution of the NSMP Memorandum of Procedure, or pursuant to their execution and Working Group approval of the First Amendment to Memorandum of Procedure. Future Dischargers wishing to enroll and participate in the NSMP Working Group shall establish their enrollment and participation by execution of a duly approved future amendment to the Memorandum of Procedure as amended by the First Amendment of Procedure.
23. This Order provides interim selenium effluent limitations in lieu of the effluent limitations set forth in Order No. R8-2007-0041. Without these interim limitations, Dischargers' waste discharges after December 20, 2009 threaten to exceed the effluent limitations set forth in Findings 10 and 11 of this Order and, thus, threaten to violate Order No. R8-2007-0041.
24. California Water Code (CWC) section 13300 states: "Whenever a regional board finds that a discharge of waste is taking place or threatening to take place that violates or will violate requirements prescribed by the regional board, or the state board, or that the waste collection, treatment, or disposal facilities of a discharger are approaching capacity, the board may require the discharger to submit for approval of the board, with such modifications as it may deem necessary, a detailed time schedule of specific actions the discharger shall take in order to

correct or prevent a violation of requirements.”

25. This Order is issued in accordance with CWC section 13300 and establishes a time schedule for compliance.
26. In accordance with CWC section 13385(j)(3), the Regional Water Board finds that each Discharger may not be able to consistently comply with the final effluent limitations for selenium set forth in Order No. R8-2007-0041. These limitations are new requirements that became applicable to Order No. R8-2007-0041 after the effective date of adoption of the waste discharge requirements, and after July 1, 2000, for which new or modified control measures are necessary in order to comply with the limitations, and the new or modified control measures cannot be designed, tested, installed, and put into operation within 30 calendar days.
27. This Order also applies to Future Dischargers (to the extent they seek coverage hereunder) because in many, if not all cases, they contemplated their discharges at a time when the final effluent limitations for selenium as set forth in Order No. R8-2007-0041 were not yet effective.
28. CWC section 13385(h) and (i) require the Regional Water Board to impose mandatory minimum penalties upon dischargers that violate certain effluent limitations. However, CWC section 13385(j) exempts certain violations from the mandatory minimum penalties. CWC section 13385(j)(3) exempts a discharge from mandatory minimum penalties “where the waste discharge is in compliance with either a cease and desist order issued pursuant to CWC section 13301 or a time schedule order issued pursuant to CWC section 13300, if all the [specified] requirements are met.”
29. Compliance with this Order exempts the Dischargers from mandatory penalties for violations of the effluent limitation for Total Recoverable Selenium, as set forth in section V.A.1.a of Order No. R8-2007-0041 in accordance with CWC section 13385(j)(3).
30. CWC section 13385(j)(3)(A) requires this Order to specify the actions that the Discharger is required to take in order to correct the potential violations that would otherwise be subject to mandatory minimum penalties. This Order requires the Dischargers to develop and implement new or modified control measures designed to achieve compliance with the effluent limitations as set forth in Findings 10 and 11 of this Order.
31. CWC section 13385(j)(3)(D) requires the preparation and implementation of a pollution prevention plan pursuant to CWC section 13263.3. In order to obtain authorization under Order No. 2007-0041, Dischargers are required to demonstrate that they have documented and made all practicable attempts to avoid, reduce or eliminate the discharge of selenium. The reduction/elimination of

selenium discharges may be accomplished through volume reduction, including sewerage. Potential volume reduction measures were evaluated by the NSMP Working Group and three volume reduction BMPs, including sewerage, were deemed feasible. Selenium occurs in the groundwater-related discharges regulated under Order No. 2007-0041 as the result of additions from natural processes not subject to the control of the Dischargers. Therefore, with respect to the selenium discharges addressed by Order No. 2007-0041, the evaluation and implementation of reasonably feasible discharge volume reduction measures, and the evaluation of and adherence to project design features or other practices that result in discharge avoidance fulfill the requirements of a Pollution Prevention Plan.

32. The interim effluent limitations established by this Order for Existing Dischargers shall be performance-based and set at lowest reasonably feasible historical discharge levels, taking into account precipitation-driven and other sources of variation in selenium concentrations; the interim effluent limitations for Future Dischargers shall also be performance-based and set at the lowest reasonably feasible levels based on consideration of requisite pre-discharge selenium quality characterization and historical selenium discharge levels for similar discharges, taking into account precipitation-driven and other sources of variation in selenium concentrations.
32. Issuance of this Order is exempt from the provisions of the California Environmental Quality Act (Public Resources Code, Section 21000, *et seq.*), in accordance with Section 15321(a)(2), Title 14, California Code of Regulations.
33. Any person adversely affected by this action of the Regional Water Board may petition the State Water Board to review the action. The petition must be received by the State Water Board Office of the Chief Counsel, P.O. Box 100, Sacramento, CA, 95812-0100, within 30 days of the date on which the action was taken. Copies of the law and regulations applicable to filing petitions will be provided on request.

**IT IS HEREBY ORDERED THAT** pursuant to CWC Section 13300 and 13385, the Existing Dischargers listed in this Order and Future Dischargers under Order No. R8-2007-0041 shall comply with the following time schedule to ensure compliance with the final effluent limitations for selenium contained in Order No. R8-2007-0041, and as set forth in Findings 10 and 11 herein.

1. Dischargers seeking coverage under this Order shall elect to participate in the Nitrogen and Selenium Management Program (NSMP) and shall provide to the Executive Officer of the Regional Water Board a copy of the Memorandum of Procedure, as amended, showing Discharger's membership in the Working Group.
2. Dischargers seeking coverage under this Order shall re-certify, as required by their Notice of Intent, that they have documented and made all practicable attempts to avoid, reduce or eliminate the discharge of selenium as required by Section II.A.3

of Order No. R8-2007-0041, within 60 days from the date of this Order, or prior to any discharge under Order No. R8-2007-0041, whichever date is later.

3. Dischargers seeking coverage under this Order shall comply with the following interim effluent limitations for Total Recoverable Selenium during the pendency of this Order; provided the NSMP Working Group is complying with the tasks and process described in Finding 21 during the period of discharge (as established by the Discharger to the satisfaction of the Executive Officer), such Dischargers shall be deemed in compliance with this Order:
  - a. Existing Dischargers shall submit to the Executive Officer for approval, no later than 60 days following the adoption of this Order, a performance-based selenium effluent limitation that is based on historical selenium discharge levels (e.g., the lowest reasonably feasible concentration based on their historical selenium discharges). Upon approval by the Executive Officer, such Discharger must not exceed this interim effluent limitation during the pendency of this Order.
  - b. Future Dischargers shall submit to the Executive Officer for approval, prior to any discharge authorized under Order No. R8-2007-0041, a performance-based effluent limitation for selenium that is based on the requisite pre-discharge characterization of selenium quality and consideration of historical selenium discharge concentrations for similar discharges (e.g., the lowest reasonably feasible concentration based on prior selenium discharges and historical practices, if any, and those of other similarly-situated dischargers). Upon approval by the Executive Officer, such Discharger must not exceed this interim effluent limitation during the pendency of this Order.
4. Dischargers who enroll under Order No. R8-2007-0041 but who do not seek coverage under this Order shall comply with final effluent limitations for selenium by no later than December 20, 2009, as set forth in Order No. R8-2007-0041.
5. If, in the opinion of the Regional Water Board Executive Officer, any Discharger seeking coverage under this Order fails to comply with the provisions of this Order, the Executive Officer may apply to the State Attorney General for judicial enforcement or issue a complaint for Administrative Civil Liability. If compliance with this Order is not achieved, the Discharger would not be exempt from the mandatory minimum penalties for violation of certain effluent limitations, and may be subject to issuance of a Cease and Desist Order in accordance with CWC section 13301.

6. Any person signing a document submitted under this Order shall make the following certification:

*"I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my knowledge and on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment."*

7. This Order, as amended by Order No. R8-2013-0060 on December 6, 2013, shall remain in effect for a maximum of two years from its current expiration date, or until December 10, 2016, or until such time as Order No. R8-2007-0041 is re-issued to incorporate revised selenium effluent limitations and other requirements necessary to implement Board approved selenium TMDLs.

This Order is effective upon the date of signature.

  
KURT V. BERCHTOLD, Executive Officer

Originally issued on December 10, 2009  
Amended on December 6, 2013 (Order No. R8-2013-0060)

**California Regional Water Quality Control Board  
Santa Ana Region**

**December 10, 2009**

**Item: 9**

**Subject: Issuance of Time Schedule Order No. R8-2009-0069** for Dischargers Enrolled in Order No. R8-2007-0041, NPDES No. CAG918002, General Discharge Permit for Discharges to Surface Waters of Groundwater Resulting from Groundwater Dewatering Operations and/or Groundwater Cleanup Activities at sites within the San Diego Creek/Newport Bay Watershed Polluted by Petroleum Hydrocarbons, Solvent, Metals and/or Salts.

**Summary:**

The issuance of Time Schedule Order (TSO) No. R8-2009-0069 is appropriate and necessary to provide additional time for dischargers in the Newport Bay watershed to come into compliance with numeric effluent limitations for selenium that are specified in Order No. R8-2007-0041, which requires compliance with those limitations no later than December 20, 2009. The numeric selenium limitations are based on the current selenium water quality objectives established by the California Toxics Rule (CTR).

Total Maximum Daily Loads (TMDLs) and site-specific objectives (SSOs) for selenium are being developed by Regional Board staff in collaboration with the Nitrogen and Selenium Management Program (NSMP) Working Group. The TMDLs include numeric targets and allocations based on (i) the recommended selenium SSOs for the Newport Bay watershed, and, in the event the SSOs are not adopted, (ii) current CTR selenium objectives. These TMDLs and SSOs are expected to be presented to the Regional Board for consideration in the spring of 2010.

When approved, the selenium SSOs will replace the existing CTR-based water quality objectives for the Newport Bay watershed. The selenium effluent limitations in Order No. R8-2007-0041 will be revised as necessary in response to the approved TMDLs/SSOs.

The proposed TMDLs include an implementation plan and a schedule for compliance that will serve as the basis for a revised schedule for compliance with the selenium effluent limitations in Order No. R8-2007-0041. However, the compliance schedule authorization provided by the TMDLs will not become effective for the purposes of revising Order No. R8-2007-0041 until the TMDLs are approved by the USEPA. The TMDL approval process is expected to take more than one year. The TSO will extend the schedule for compliance with the numeric selenium effluent limitations in Order No. R8-2007-0041 for a maximum

of five years from the date of adoption of the TSO. This compliance schedule extension will allow the TMDL/SSO approval and permit amendment processes to be completed such that an appropriate compliance schedule, effluent limitations, and other requirements can be incorporated in the waste discharge requirements. This compliance schedule extension is appropriate because of the very significant commitment of resources by the NSMP Working Group to assist in the development of the selenium TMDLs/SSOs and a cutting-edge regional selenium management program (including development of selenium treatment technologies) for the Newport Bay watershed that will result in the achievement of water quality standards for a very difficult-to-address bioaccumulative pollutant.

**Discussion:**

In 2002, as part of a number of TMDLs for toxic pollutants, USEPA promulgated TMDLs for selenium for the San Diego Creek subwatershed and both Upper and Lower Newport Bay, based primarily on exceedance of the currently applicable CTR selenium criteria for freshwater, as well as trends in selenium concentrations in freshwater fish tissue and the proximity of Newport Bay to the San Diego Creek subwatershed. Rising groundwater in the San Diego Creek subwatershed is the primary source of selenium to the Bay.

In December 2004, the Regional Board adopted Order No. R8- 2004-0021, NPDES No. CAG998002, General Waste Discharge Requirements for Short-Term Groundwater-Related Discharges and De Minimus Wastewater Discharges to Surface Waters within the San Diego Creek/Newport Bay Watershed. Prior to the issuance of Order No. R8-2004-0021, most dewatering and other types of groundwater discharges in the watershed were considered insignificant, or "de minimus", contributors of pollutants and had been regulated under the Regional Board's general de minimus NPDES permit. The issuance of Order No. R8-2004-0021 was necessitated by the recognition that groundwater-related discharges in the Newport Bay watershed had the potential to contribute selenium to the surface waters in the watershed and that such discharges could no longer be considered insignificant in light of the findings of selenium impairment leading to the USEPA TMDLs. Order No. R8-2004-0021 included final numeric water quality based effluent limitations for selenium discharges based on the applicable CTR selenium criteria.

In adopting Order No. R8-2004-0021, the Regional Board also recognized that there were no conventional selenium treatment technologies that could be applied to achieve the selenium limitations and that, therefore, immediate compliance with the selenium limitations in the Order would likely be infeasible for many dischargers. Accordingly, Order No. R8-2004-0021 includes a schedule for compliance with the final numeric selenium limitations. Pursuant to the compliance schedule provisions of the State Board's policy for

implementation of the CTR criteria (the "SIP"<sup>1</sup>), Order No. R8-2004-0021 included a maximum five-year schedule for compliance with the selenium limitations, i.e, compliance with the selenium limitations was to be achieved as soon as possible but no later than December 20, 2009.

Numerous stakeholders within the Newport Bay watershed expressed ongoing concern that ultimate compliance with the selenium limitations, even with the five-year compliance schedule, would be highly problematic, given the lack of available, practicable treatment technology that could achieve the requisite selenium reductions. This concern, coupled with concerns about the validity and effectiveness of the CTR criteria for protecting biological resources in the watershed, prompted the formation of a voluntary program known as the Nitrogen and Selenium Management Program (NSMP), sponsored by the NSMP Working Group. The Working Group is comprised of many stakeholders in the Newport Bay watershed, including the County of Orange, municipalities within the watershed, other dischargers, and several environmental organizations. The Regional Board is a non-funding member of the Working Group. The Working Group proposed to develop and implement a five-year Work Plan designed to evaluate and recommend refinements to the USEPA selenium TMDLs, to develop treatment technologies and an appropriate implementation plan for the refined TMDLs, and to consider recommendations for a site-specific selenium objective for the Newport Bay watershed that would supplant the CTR selenium criteria<sup>2</sup>.

Order No. R8-2004-0021 included requirements that reflected the proposed NSMP Working Group approach and required the development, Regional Board approval, and thence implementation of a Work Plan to accomplish those specific tasks. Order No. R8-2004-0021 provided that participation by dischargers in the NSMP Working Group and effective and timely implementation of the approved Work Plan would constitute interim, performance-based limitations. The Order also allowed dischargers who did not wish to participate in the NSMP Working Group to implement a program approved by the Executive Officer to offset selenium discharges in excess of the final numeric effluent limitations. Steps to implement that offset program were considered interim, performance-based limitations. The intent of the offset program was to assure that there would be no net loading of selenium to surface waters in the Newport Bay watershed as the result of the discharges prior to full compliance with the final numeric effluent limitations.

In 2007, the Regional Board adopted Order No. R8-2007-0041 as part of a permit streamlining effort. Like Order No. R8-2004-0021, Order No. R8-2007-

---

<sup>1</sup> "Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California"

<sup>2</sup> The Working Group also committed to perform work to support the review of the Nutrient TMDL established for the Newport Bay watershed in 1998 and to formulate a nutrient management plan.

0041 regulates groundwater-related discharges but also includes requirements for discharges from groundwater cleanup operations within the Newport Bay watershed. This combined approach obviates the need for dischargers who may need authorization for both types of discharges to obtain coverage under both permits, for which payment of both permit fees would be required. Order No. R8-2007-0041 includes the same NSMP/offset interim performance-based limitations as Order No. R8-2004-0021. Consistent with the SIP, Order No. R8-2007-0041 maintains the same compliance schedule for achieving compliance with final numeric water quality based effluent limitations for selenium as Order No. R8-2004-0021, i.e., compliance with the final numeric effluent limitations must be achieved no later than December 20, 2009.<sup>3</sup> Discharge authorization for enrollees under Order No. R8-2004-0021 has been transferred to Order No. R8-2007-0041 and Order No. R8-2004-0021 now has been rescinded.

The approved NSMP Work Plan has now been essentially completed and has resulted in recommended, revised TMDLs, including an implementation plan. The TMDLs, including the implementation plan, are continuing to be refined further and are expected to be presented as a Basin Plan amendment for the Regional Board's consideration in the spring of 2010. Further, the NSMP Working Group effort has resulted in specific recommendations for site-specific objectives (SSOs) for selenium for the Newport Bay watershed. When fully approved, these SSOs will replace the CTR-based objectives for selenium in the Newport Bay watershed. These SSOs are reflected in the TMDLs to be recommended to the Regional Board and will be included in the Basin Plan amendment package to be considered by the Regional Board in the spring of 2010. In the event the SSOs are not adopted, the TMDLs also include alternative CTR-based numeric targets and allocations.

The proposed TMDLs currently include a recommended compliance schedule of a maximum of 15 years from the date the TMDLs become effective. The TMDLs become effective for NPDES and other Clean Water Act purposes once they are approved by USEPA. Once the TMDLs are fully approved, including by USEPA, the compliance schedule authorization provided in the TMDLs can be used as the basis for including compliance schedules for selenium limitations in NPDES permits. Once the TMDLs are finally approved, Regional Board staff will recommend specific revisions to Order No. R8-2007-0041 (and/or the issuance of a new permit, as appropriate) to incorporate requirements consistent with the TMDLs, including revised schedules for compliance and selenium effluent limitations (including, potentially, narrative or performance-based limitations). However, until the TMDL approval process is completed, the effective compliance date for those limits are those established in the existing Order. The TSO will provide for compliance with the existing Order.

---

<sup>3</sup> The first time that the selenium-related discharges were subject to CTR-based effluent limitations was in Order No. R8-2004-0021, and discharges were required to meet CTR-based effluent limits no later than December 20, 2009.

While significant progress has been made to identify potential selenium treatment technologies (including regional treatment), compliance with the final numeric selenium limitations in Order No. R8-2007-0041 on December 20, 2009 remains infeasible for many dischargers. A significant amount of work remains to be done to further evaluate potential treatment technologies to assure their efficacy before costly, full-scale implementation is considered. The Working Group has prepared a draft BMP Strategic Plan that outlines the steps proposed to further address selenium BMP evaluation and implementation over the fifteen year period currently proposed by the draft TMDLs. Implementation of the BMP Strategic Plan is expected to result in compliance with the draft TMDLs and, thereby, water quality standards (as they may or may not be amended by the SSOs). The development and implementation of such a BMP plan is a requirement of the draft TMDLs for dischargers who elect to comply with applicable allocations through the NSMP process.

Absent additional compliance schedule relief, after December 20, 2009, groundwater-related discharges by the dischargers enrolled in Order No. R8-2007-0041 may result in violations of the final selenium effluent limitation in that Order. Such violations would likely result in the imposition of mandatory minimum penalties pursuant to section 13385 of the California Water Code.

Controlling sources of selenium inputs to surface waters in the Newport Bay watershed poses extraordinary challenges. As stated above, there is currently no readily available, conventional treatment technology that can be implemented in a reasonably practicable manner for point source or non-point sources of selenium. Further, in the Newport Bay watershed, approximately 85% of the existing selenium loads in surface waters originates from groundwater, and much of this load (about 78%) results from diffuse rising groundwater, which enters surface waters via springs and seeps in the unlined portions of the channels, and cracks and weepholes in storm drains and the concrete-lined portions of the channels. Discrete, groundwater-related discharges (e.g., groundwater dewatering and cleanup) and other regulated discharges (e.g., urban runoff) account for a relatively small part of the selenium load to surface waters. It is evident that selenium reductions needed to protect beneficial uses would be best achieved on a regional, watershed-wide scale.

The NSMP Working Group has made, and continues to make significant commitments of resources to develop a proposed watershed-wide selenium management strategy that will address rising groundwater, as well as dewatering and other types of discharges. The TMDLs that will be recommended to the Regional Board in early spring 2010 rely to a significant degree on that management strategy and its implementation. In light of those significant commitments by the Working Group, that a management strategy has been identified that is believed will achieve water quality standards but requires additional time to be approved and implemented, and in view of the recognized need to provide more time to evaluate and implement effective selenium

**TSO R8- 2009-0069**

treatment BMPs, it is appropriate to provide additional schedule relief for compliance with the numeric selenium limitations in Order No. R8-2007-0041. Additional compliance schedule relief will allow for full approval of the TMDLs/SSOs and revision of the Order to incorporate revised compliance schedules and effluent limitations consistent with the TMDLs. The issuance of the TSO will not delay ultimate compliance with the TMDLs. Rather, the TSO will merely provide additional time for approval of the TMDLs/SSOs while protecting the dischargers who have committed and will commit significant resources to their development and implementation from enforcement for violations of Order No. R8-2007-0041.

California Water Code section 13300 states: "Whenever a regional board finds that a discharge of waste is taking place or threatening to take place that violates or will violate requirements prescribed by the regional board, or the state board, or that the waste collection, treatment, or disposal facilities of a discharger are approaching capacity, the board may require the discharger to submit for approval of the board, with such modifications as it may deem necessary, a detailed time schedule of specific actions the discharger shall take in order to correct or prevent a violation of requirements." A detailed time schedule of actions proposed to address final selenium effluent limitation compliance has been submitted and is reflected in Tentative TSO No. R8-2009-0069. Dischargers seeking coverage under the TSO are required to implement these tasks in accordance with the schedule identified.

Once the TMDLs are approved and Order No. R8-2007-0041 is revised accordingly, including a revised schedule for compliance and selenium effluent limitations, the TSO will be rescinded.

**Recommendation:** Adopt Time Schedule Order No. R8-2009-0069 as presented.

State of California  
California Regional Water Quality Control Board  
Santa Ana Region

March 22, 2013

ITEM:        **\*10**

SUBJECT:    Renewal/Update of Waiver of Waste Discharge Requirements for Specific  
Types of Discharges, Resolution No. R8-2013-0015

DISCUSSION:

The Regional Board prescribes Waste Discharge Requirements for waste discharges in accordance with Section 13263 of the California Water Code. Many types of discharges, however, do not contain a significant amount of pollutants, and have no significant effect on the quality and beneficial uses of the waters of the State. It is in the best interest of the public and the Board not to expend the resources necessary to regulate discharges that have an insignificant potential to affect water quality standards.

Section 13269 of the California Water Code empowers the Regional Board to waive waste discharge requirements for specific types of discharges where such a waiver is in the public interest. Such waivers are conditional and may be terminated by the Board at any time.

It is important to emphasize also that each request for such a waiver would be considered on a case-specific basis by Regional Board staff. The Regional Board retains its authority to issue waste discharge requirements, or to take other requisite regulatory action, where site-specific conditions warrant. This is true even when the conditions specified in the waiver resolution are met. It is recognized that the waiver conditions may not anticipate all relevant factors (e.g., proximity to groundwater contamination plumes or to Clean Water Act Section 303(d) listed impaired waters) that may necessitate an independent regulatory response.

Water Code Section 13269 stipulates that all existing waivers must be reviewed at 5-year intervals and either renewed or terminated.

On September 7, 2007, the Regional Board adopted Resolution No. R8-2007-0036, which waived waste discharge requirements for specific types of discharges, provided that certain conditions stipulated in the resolution were met. Since Resolution No. R8-2007-0036 was adopted more than five years ago, the Regional Board must review the conditions specified in the resolution pursuant to Water Code Section 13269.

Accordingly, the 2007 list of specific types of discharges has been reviewed. The proposed Resolution No. R8-2013-0015 continues the criteria for waivers specified in Resolution R8-2007-0036 for the following types of discharges:

- a. Inert Waste Disposal Operations,
- b. Sand, Gravel, and Quarry Operations,
- c. Residential Onsite Wastewater Disposal Systems (septic tanks ) Not Within Prohibition Areas,
- d. Industrial and Commercial Onsite Wastewater Disposal Systems (septic tanks) Not Within Prohibition Areas,
- e. Monitoring Well Purge water,
- f. Well Drill Cuttings,
- g. Incidental Discharge of Oily Wastewater During Oil Spill Response Activities, and
- h. Other Insignificant Discharges of Wastewater to Land (eg: potable water pipeline draining, groundwater dewatering, etc.).
- i. Groundwater Recharge Projects Using Imported Water

One additional type of discharge is being added to the list - Composting Research Projects.

Composting Research Projects are pilot projects that typically last one to three years, involve a small quantity of feedstock materials, and are conducted over a small area of land. These research projects are conducted strictly for information gathering, or as part of a study leading to an action which a public agency has not yet approved, adopted, or funded. As such, these projects are categorically exempted under Section 15306 (Information Collection) of the CEQA by the lead agencies conducting CEQA compliance. A waiver of WDRs is appropriate for this type of projects where insignificant threat to water quality is demonstrated through meeting the following conditions:

1. Active composting and curing materials, such as feedstocks, additives, and amendments, are stored and treated on working surface or composting pads(s) meeting a minimum hydraulic conductivity of  $1 \times 10^{-6}$  cm/s;
2. Compost leachate, wastewater, and stormwater runoff that comes into contact with raw, partial, and active composting materials are collected and stored in a wastewater containment system or basin having a liner meeting a minimum hydraulic conductivity of  $1 \times 10^{-6}$  cm/s;

3. The wastewater containment system shall be designed, constructed and maintained to contain runoff resulting from a 25-year, 24-hour storm event; and
4. No offsite discharge from the research project area is allowed unless the discharge is specifically permitted under an NPDES permit.

Board staff considered the merits of the development of general waste discharge requirements for one or more of the types of discharges identified in the proposed waiver resolution. The advantage of such an approach would be that general waste discharge requirements would not need to be revisited more than once every ten years, as opposed to the requirement to review the waiver resolution at least once every five years. However, considerable staff time would be required to develop general waste discharge requirements applicable to these discharges. Given that these discharges are not expected to have significant impacts on water quality standards, Board staff believes that it is a better use of the Board's resources to adopt and implement the proposed waiver resolution. Efficient use of the Board's resources is in the public interest.

The types of waste discharges listed in Attachment "A" to Resolution No. R8-2013-0015 were identified on the basis that they should not result in significant adverse environmental effects, provided that the criteria and conditions also listed in Attachment "A" are satisfied. Again, where site-specific conditions warrant, the Executive Officer may specify additional criteria and conditions.

The waiver of waste discharge requirements for the specific types of discharges identified in Attachment "A" will not affect the Regional Board's authority to regulate discharges where water quality or beneficial uses could be impacted. The Resolution explicitly grants the Executive Officer of the Regional Board the authority to deny waivers for specific projects and to recommend to the Regional Board issuance of individual waste discharge requirements, or coverage under applicable general waste discharge requirements, for projects determined to have the potential for significant impacts on the water quality standards of the State.

**RECOMMENDATION:**

Adopt Resolution No. R8-2013-0015 as presented.

California Regional Water Quality Control Board  
Santa Ana Region

RESOLUTION NO. R8-2013-0015

Waiver of Waste Discharge Requirements  
for Specific Types of Discharges

WHEREAS, the California Regional Water Quality Control Board, Santa Ana Region (hereinafter Regional Board), finds that:

1. Section 13263(a) of the California Water Code requires Regional Boards to prescribe requirements for existing and proposed waste discharges in their respective areas of jurisdiction.
2. Section 13269 of the California Water Code authorizes Regional Boards to waive waste discharge requirements for a specific discharge or specific types of discharges where such a waiver is consistent with applicable water quality control plans and is in the public interest.
3. The waiver of waste discharge requirements for discharges that do not pose a significant threat to water quality would enable staff resources to be used effectively and avoid unnecessary expenditures of these limited resources and, thus, is in the public interest.
4. Section 13269 of the California Water Code requires Regional Boards to review and renew or terminate all waivers every five years and to conduct a public hearing prior to renewing any waiver for a specific type of discharge in order to determine whether the discharge should be subject to general or individual waste discharge requirements.
5. On September 7, 2007, the Regional Board adopted Resolution No. R8-2007-0036 for waiver of waste discharge requirements for specific types of discharges. Resolution No. R8-2007-0036 must be reviewed and updated to comply with Section 13269 of the California Water Code.
6. Attachment "A" to this Resolution lists specific types of discharges that are expected to continue to have an insignificant effect on the quality of waters of the State, provided the corresponding criteria and conditions are met. Each such discharge would be considered on a case-specific basis to determine whether and what additional conditions are required to protect the quality of waters of the State, or whether coverage under individual or general waste discharge requirements is necessary.

**Resolution No. R8-2013-0015**  
**Waiver of Waste Discharge Requirements**

7. Waiving waste discharge requirements for the specific types of discharges listed in Attachment "A" is in the public interest. These discharges will not have an adverse impact on water quality standards or the environment, provided that the discharger satisfies the criteria and conditions identified in Attachment "A" and any additional conditions specified by the Executive Officer as the result of case-specific consideration of the proposed discharge. Further, the Executive Officer has the authority to deny a request for a waiver where such a waiver would not be in the public interest.
8. On September 6, 2002, the Regional Board adopted an Initial Study and Negative Declaration regarding the waiver of waste discharge requirements for the majority of the specific types of discharges listed in Attachment "A" in accordance with the California Environmental Quality Act (Public Resources Code, Section 21000 et seq.) and the State Guidelines. The types of activities identified in Attachment "A" will not have a significant effect on the environment provided that they are conducted in conformance with the criteria and conditions specified in Attachment "A" and any additional criteria/conditions specified by the Executive Officer in issuing a waiver of waste discharge requirements.
9. This resolution waives waste discharge requirements for one additional type of discharge listed in Attachment "A", Composting Research Projects, to the specific types of discharges for which waste discharge requirements were waived under Resolution R8-2007-0036. The Composting Research Projects are conducted strictly for information gathering, or as part of a study leading to an action which a public agency has not yet approved, adopted or funded. These projects are categorically exempt under Section 15306, Title 14, California Code of Regulations. Therefore, the adoption of this resolution to waive waste discharge requirements complies with the California Environmental Quality Act.
10. On March 22, 2013, the Board held a public meeting and considered all the evidence concerning this matter. Notice of this hearing was given to all interested persons in accordance with the California Government Code Section 11125.

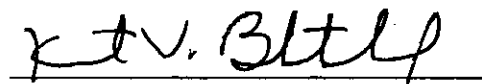

**THEREFORE, BE IT RESOLVED** that the California Regional Water Quality Control Board, Santa Ana Region:

1. Waives waste discharge requirements for the specific types of discharges listed in Attachment "A", except those for which individual waste discharge requirements or general waste discharge requirements have already been

**Resolution No. R8-2013-0015**  
**Waiver of Waste Discharge Requirements**

- adopted. Waste discharge requirements are waived for each specific type of discharge listed provided that the corresponding criteria and conditions are met.
2. Waste discharge requirements for the specific types of discharges listed in Attachment "A" that were waived by previous resolutions adopted by the Regional Board continue, provided that the corresponding criteria and conditions continue to be met.
  3. For new discharges, waste discharge requirements for a specific discharge shall be considered waived only after a Report of Waste Discharge<sup>1</sup> is submitted and the Executive Officer determines that the conditions specified in Attachment "A" for the specific type of discharge will be met.
  4. Any action under this waiver is conditional and may be terminated for any type of discharge or any specific discharge at any time within the term of this waiver.
  5. Waste discharge requirements for a specific discharge shall be considered waived only after the Executive Officer determines that the conditions specified in Attachment "A" for the specific type of discharge will be met.
  6. The Executive Officer is authorized to deny a waiver of waste discharge requirements and to recommend the issuance of individual waste discharge requirements or coverage under general waste discharge requirements for projects that would result in the discharge of waste that may have a significant impact on the water quality standards of the State.

I, Kurt V. Berchtold, Executive Officer, do hereby certify that the foregoing is a full, true, and correct copy of a resolution adopted by the California Regional Water Quality Control Board, Santa Ana Region, on March 22, 2013.

Kurt V. Berchtold  
Executive Officer

---

<sup>1</sup> The need to file a formal Report of Waste Discharge, pursuant to CWC Section 13260, may be waived by the Executive Officer on a case-by-case basis.

Attachment "A" to Resolution No. R8-2013-0015

Specific Types of Discharges for Which Waste Discharge Requirements are Waived

| TYPES OF DISCHARGE  | CRITERIA AND CONDITIONS  |
|---|--|
| <p>Inert Waste Disposal Operations</p>  | <ol style="list-style-type: none"> <li>1. Only inert waste, as defined in Section 20230, Division 2, Title 27, of the California Code of Regulations, will be disposed of. No green waste, wood waste or gypsum board (or similar construction wastes) are allowed,</li> <li>2. Controls sufficient to contain all surface runoff are installed, where necessary, and</li> <li>3. The site will be adequately secured to prevent unauthorized disposal by the public.</li> </ol> |
| <p>Sand, Gravel, and Quarry Operations</p>  | <ol style="list-style-type: none"> <li>1. All operations and wash waters are contained within the facility,</li> <li>2. No waste discharge (including storm water runoff from operations areas) to surface waters will occur, and</li> <li>3. Stockpiles and settling basins will be protected from inundation from 100-year peak storm flows.</li> </ol>  |
| <p>Residential Onsite Wastewater Disposal Systems (septic tanks) Not Within Prohibition Areas</p>               | <ol style="list-style-type: none"> <li>1. Developments comply with the Regional Board's "Guidelines for Sewage Disposal from Land Developments", and</li> <li>2. Developments comply with the Regional Board's "Minimum Lot Size Requirements and Exemption Criteria for New Developments Using On-Site Septic Tank-Subsurface Leaching/Percolation Systems".</li> </ol>   |
| <p>Industrial and Commercial Onsite Wastewater Disposal Systems (septic tanks) Not Within Prohibition Areas</p> | <ol style="list-style-type: none"> <li>1. Only sanitary wastes to be discharged into the septic systems,</li> <li>2. Developments comply with the Regional Board's "Guidelines for Sewage Disposal from Land Developments", and</li> <li>3. Developments comply with the Regional Board's "Minimum Lot Size Requirements and Exemption Criteria for New Developments Using On-Site Septic Tank-Subsurface Leaching/Percolation Systems".</li> </ol>                              |

| TYPES OF DISCHARGE   | CRITERIA AND CONDITIONS  |
|--|--|
| Monitoring Well Purge Water  | <ol style="list-style-type: none"> <li>1. Purge water is discharged to the ground in a manner so that it will percolate back into the aquifer in the same general area from which it came, and</li> <li>2. Adequate measures will be taken to prevent purge water from reaching surface waters.</li> </ol>   |
| Well Drill Cuttings  | <ol style="list-style-type: none"> <li>1. Cuttings determined not to be considered as hazardous waste, and</li> <li>2. Cuttings disposed of or used in a manner so as to not affect water quality or beneficial uses.</li> </ol>   |
| Incidental Discharge of Oily Wastewater During Oil Spill Response Activities | <ol style="list-style-type: none"> <li>1. Discharges occur during an oil spill response activity, and</li> <li>2. Discharges are within or proximate to the oil spill response area.</li> </ol>  |
| Composting Research Projects   | <ol style="list-style-type: none"> <li>1. Active composting and curing materials, such as feedstocks, additives, and amendments, are stored and treated on working surface or composting pads(s) meeting a minimum hydraulic conductivity of <math>1 \times 10^{-6}</math> cm/s;</li> <li>2. Compost leachate, wastewater, and stormwater runoff that comes into contact with raw, partial, and active composting materials are collected and stored in a wastewater containment system or basin having a liner meeting a minimum hydraulic conductivity of <math>1 \times 10^{-6}</math> cm/s;</li> <li>3. The wastewater containment system shall be designed, constructed and maintained to contain runoff resulting from a 25-year, 24-hour storm event; and</li> <li>4. No offsite discharge from the research project area is allowed unless the discharge is specifically permitted under an NPDES permit.</li> </ol> |

| TYPES OF DISCHARGE   | CRITERIA AND CONDITIONS  |
|--|--|
| Groundwater Recharge Projects Using Imported Water   | <ol style="list-style-type: none"> <li>1. Any agency that intentionally recharges imported water within the Santa Ana Region will collect, compile, and analyze N/TDS and constituents of emerging concern (CECs) water quality data necessary to determine whether the intentional recharge of imported water in the Region may have a significant adverse impact on compliance with the N/TDS objectives within the Region, and</li> <li>2. The recharge proponent must be a signatory to the Cooperative Agreement to Protect Water Quality and Encourage the Conjunctive Uses of Imported Water in the Santa Ana River Basin, or a similar agreement with the Regional Water Board.</li> </ol> |
| Other Insignificant Discharges of Wastewater to Land (eg: potable water pipeline draining, groundwater dewatering, etc.) | <ol style="list-style-type: none"> <li>1. All wastewater discharged in a manner so that it will percolate into the ground before reaching surface waters, and</li> <li>2. All wastewater disposed of or used in a manner so as to not affect water quality or beneficial uses.</li> </ol>  |

**The following conditions apply to all of the above types of discharges:**

1. Implementation of the project shall not create a nuisance or pollution as defined in the California Water Code Section 13050.
2. The project shall not cause a violation of any applicable water quality standard for receiving waters adopted by the Regional Board or the State Water Resources Control Board, as required by the Clean Water Act.
3. The discharge of any substance in concentrations toxic to animal or plant life is prohibited.
4. The waiver of waste discharge requirements may be terminated by the Executive Officer at any time.
5. Discharges subject to discretionary approval by other agencies will be eligible for a waiver only after the completion of any documentation required by the California Environmental Quality Act.
6. Compliance with the criteria and conditions identified for each type of discharge does not guarantee issuance of a waiver. Each waiver request will be considered on a case-specific basis. The Executive Officer, at his/her discretion, may deny the request for a waiver and recommend coverage of the discharge under an individual waiver, or coverage under individual or general waste discharge requirements as appropriate to protect water quality.

### GENERAL WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES FROM TEMPORARY GROUNDWATER EXTRACTION AND SIMILAR WASTE DISCHARGES TO SAN DIEGO BAY, TRIBUTARIES THERETO UNDER TIDAL INFLUENCE, AND STORM DRAINS OR OTHER CONVEYANCE SYSTEMS TRIBUTARY THERETO (WDR)

**ORDER NO. R9-2007-0034**  
**NPDES NO. CAG919001**

A Discharger, as described in the following table that has complied with the requirements for coverage under this General "Waste Discharge Requirements" (WDR), is subject to waste discharge requirements, once permit coverage is effective, as set forth in this WDR.

|             |  |
|-------------|--|
| Dischargers | Any person with temporary discharges from ground water extraction activities to waters of the San Diego Bay, tributaries thereto under tidal influence, and storm drains or other conveyances systems tributary thereto that do not cause, have the reasonable potential to cause, or contribute to an instream excursion above any applicable State or federal water quality objectives/criteria or cause acute or chronic toxicity in the receiving water. |
|-------------|--|

|  |                  |
|--|------------------|
| This WDR was adopted by the Regional Board on:   | October 10, 2007 |
| This WDR shall become effective on:  | October 10, 2007 |
| This WDR shall expire on:  | October 10, 2012 |
| The U.S. Environmental Protection Agency and the California Regional Water Quality Control Board, San Diego Region have classified these discharges as minor discharges. |                  |

IT IS HEREBY ORDERED that Order No. 2000-90 is rescinded upon the effective date of this WDR except for enforcement purposes, and, in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted therein, and the provisions of the federal Clean Water Act, and regulations and guidelines adopted therein, Dischargers shall comply with the requirements in this WDR.

I, John H. Robertus, Executive Officer, do hereby certify the following is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Diego Region on October 10, 2007.

John H. Robertus, Executive Officer

**California Environmental Protection Agency**

## **I. DISCHARGE INFORMATION**

### **A. Groundwater Extraction**

Existing and proposed discharges of groundwater extraction waste to San Diego Bay from construction groundwater extraction, foundation groundwater extraction and groundwater extraction related to groundwater remediation cleanup projects (collectively groundwater extraction):

1. Result from similar operations (all involve extraction and discharge of groundwater);
2. Are the same type of wastes (all are groundwater containing or potentially containing petroleum hydrocarbons, solvents, or other pollutants);
3. Require similar effluent limitations for the protection of the beneficial uses of San Diego Bay;
4. Require similar monitoring; and
5. Are more appropriately regulated under a WDR rather than individual permits.

## **II. PERMIT INFORMATION**

### **A. Application**

To obtain coverage under this WDR a Discharger must submit the following to the California Regional Water Quality Control Board, San Diego Region (Regional Board):

1. A Notice of Intent (NOI), including the following information:
  - a. Owner/Operator name;
  - b. Owner/Operator address;
  - c. Owner/Operator telephone number;
  - d. Site name
  - e. Site address
  - f. Type of discharges;
  - g. Name of receiving waterbody and conveyance(s); and
2. An initial sampling and monitoring report of 164 constituents for flows of 50,000 gallons per day (gpd) or more or 38 constituents for flows under 50,000 gpd;
3. A project map(s) that shows the essential features of the groundwater extraction system within the Regional Board boundary, and the corresponding surface water or storm drain to which water will be discharged; and
4. Payment of the application fee, equal to the first annual fee, made payable to "SWRCB."

The NOI form is included within this WDR package as Attachment B.

The WDR NOI, including, map(s), the application fee, and other attachments, must be submitted to the following address:

CRWQCB – San Diego Region  
9174 Sky Park Court, Suite 100  
San Diego, CA 92123

Attn: Groundwater Extraction to San Diego Bay  
Southern Core Regulatory Unit  
NOTICE OF INTENT

#### **B. Coverage**

WDR coverage will be effective when all of the following have occurred:

1. The Discharger has submitted a complete NOI application (including initial sampling and monitoring report), as determined by the Regional Board; and
2. The Regional Board issues the Discharger's a Notice of Enrollment, which includes the discharge flow limit, mass limit, any additional or increase in monitoring due to specific circumstances of the discharge, and any other additional requirements.
3. Current dischargers enrolled in Order No. 2000-90 shall re-enroll no later than 365 days after adoption of this WDR, each discharger currently enrolled in Order No. 2000-90 shall continue to comply with Order No. 2000-90 until obtaining permit coverage under this WDR.

#### **C. Eligibility Criteria**

This WDR is intended to cover temporary discharges of groundwater extraction wastes to San Diego Bay, and its tributaries under tidal influence, from groundwater extraction due to construction and other groundwater extraction activities. Dischargers must meet the following criteria to be subject to waste discharge requirements by this WDR:

1. The discharge of any flow (rate or volume) of extracted groundwater due to groundwater extraction activities is discharged into San Diego Bay;
2. The discharge of groundwater extraction wastes will not be permanent. Groundwater extraction operations for structures which 1) are not designed or constructed to withstand hydrostatic pressure or do not preclude infiltration of groundwater, and 2) require removal of groundwater to prevent water infiltration to the structure(s) are permanent discharges.
3. Pollutant concentrations in the discharge comply with the Discharge Specifications of this WDR.

This WDR does not cover:

**PERMANENT DISCHARGES** – Groundwater extraction operations for structures which 1) are not designed or constructed to withstand hydrostatic pressure or do not preclude infiltration of groundwater, and 2) require removal of groundwater to prevent water infiltration to the structure(s) are permanent discharges except for the following two existing permanent groundwater extraction discharges currently

enrolled in Order 2000-90 until such time the discharges receive an individual permit:

- a. Embassy Suites Hotel permanent dewatering system
- b. One America Plaza permanent dewatering system

**STORM WATER** - Storm water runoff due to construction activities. These activities may be covered under the statewide general NPDES permit for storm water discharges associated with construction activities (CAS000002), the statewide general NPDES permit for storm water runoff associated with small linear underground/overhead construction projects (CAS000005), and/or Clean Water Act (CWA) Section 401 Water Quality Certifications.

**SANITARY SEWER** - Discharges to a sanitary sewer. These discharges do not need coverage under the NPDES Program. Contact the agency controlling the sanitary sewer for approval prior to discharging to its conveyance system.

**UTILITY VAULTS** - Discharges from utility vaults and underground structures. These activities may be covered under the statewide general NPDES permit for discharges from utility vaults and underground structures to surface water (CAG990002).

**HYDROSTATIC/ POTABLE WATER** - Discharges from drinking water well development. These discharges are covered under Order No. R9-2002-0020.

**D. Discharge to a Municipal Separate Storm Sewer System (MS4)**

Prior to discharging into an MS4, the Discharger shall demonstrate alternatives to discharging extracted groundwater waste into an MS4 and why it is technically or economically infeasible to implement these alternatives.

Without prior approval from the appropriate local agency with jurisdiction over the MS4, the discharger shall not discharge extracted groundwater waste under this WDR into an MS4.

Local agencies responsible for operating the MS4s may not passively receive and discharge pollutants from third parties. By providing free and open access to an MS4 that conveys discharges to waters of the U.S., the MS4 operator essentially accepts responsibility for discharges into the MS4 that it does not prohibit or control. These discharges may cause or contribute to a condition of contamination or a violation of water quality standards.

Therefore, at least 30 days prior to initiating an extracted groundwater discharge to an MS4, the Discharger shall notify and receive authorization from the appropriate local agency with jurisdiction over the MS4. This requirement encourages communication between Dischargers enrolled under this WDR and local agencies responsible for MS4s in an effort to reduce misunderstandings and concerns over the types of discharges covered by this WDR.

#### **E. Termination of Discharges**

Dischargers shall submit a written request referred to as a "Notice of Termination (NOT)" to this Regional Board when coverage under this WDR is no longer required. The NOT letter constitutes a notice that the owner (and his/her agent) of the site has ceased the discharge of ground water associated with the groundwater extraction activities at the site under this WDR.

The NOT should include "Notice of Termination (NOT)" In the subject line, the Waste Discharge Identification Number (WDID) assigned to the project by the Regional Board when enrolled in the WDR, the name and address of the owner, and be signed and dated by the owner in accordance with the signatory requirements of the WDR. The Discharger shall continue to comply with the requirements of the WDR until the Regional Board approves the NOT. Submittal of a NOT letter does not guarantee termination. Approval of the NOT does not relieve the Discharger's responsibility for paying any applicable outstanding invoices of annual fees as a result of enrollment under this WDR.

#### **F. Re-Enrollment of Renewed Permit**

Dischargers enrolled under previous WDR Order No. 2000-90 that plan on continuing their discharge, must re-enroll by submitting an NOI to obtain coverage under this WDR. Re-enrollees shall re-enroll no later than 365 days after the date of adoption of this WDR to achieve compliance with the new effluent limitations and criteria established by this WDR.

At the current time, permanent discharges from the following extraction facilities that were enrolled into the prior WDR may continue as permanent enrollees, provided they comply with the new effluent limitations, monitoring reporting program, and other criteria in this WDR:

- a. Embassy Suites Hotel permanent dewatering system
- b. One America Plaza permanent dewatering system

#### **G. Transferring Ownership**

Enrollment under the WDR for a specific project is not transferable. In the event of any change in control or ownership of land or waste discharge facilities presently owned or controlled by the enrolled Discharger, the Discharger must notify the new succeeding owner or operator of the existence of this WDR by letter 120 days prior to property transfer, a copy of which must be immediately forwarded to the Regional Board office. Additionally, the Discharger must submit a NOT to the Regional Board. The new succeeding owner or operator must submit a new NOI in application of enrollment under this WDR.

### **III. Findings**

The Regional Board finds:

#### **A. Background**

This WDR supersedes Order No. 2000-90. The NPDES No. CAG919001 remains the same. Dischargers enrolled under previous Order No. 2000-90 must obtain coverage under this new WDR to continue their discharge subject to waste discharge requirements in this WDR.

**B. Discharge Subject to Waste Discharge Requirements**

To be subject to waste discharge requirements in this WDR for continued and future discharge to waters of the United States, Dischargers must submit an NOI and obtain coverage in order to be regulated under this WDR as provided in 40 CFR section 122.28 (b)(2).

**C. Discharge Description**

Existing and proposed discharges of groundwater extraction waste to San Diego Bay from construction groundwater extraction, foundation groundwater extraction and groundwater extraction related to groundwater remediation (collectively referred to as Groundwater Extraction):

**D. Legal Authorities**

These waste discharge requirements are issued pursuant to Sections 13263 and 13377 of the California Water Code (CWC). The Regional Board shall prescribe requirements as to the nature of any proposed discharge and shall issue waste discharge requirements which apply and ensure compliance with all applicable provisions of the Federal Water Pollution Control Act, also referred as the Clean Water Act (CWA).

These waste discharge requirements issued by the Regional Board shall also serve as an NPDES permit for point source discharges from groundwater extraction waste to San Diego Bay.

States may request authority to issue general NPDES permits pursuant to 40 CFR section 122.28. On June 8, 1989, the California State Water Resources Control Board (State Board) submitted an application to USEPA requesting revisions to its NPDES Program in accordance with 40 CFR sections 122.28, 123.62, and 403.10. The application included a request to add WDR authority to its approved NPDES Program. On September 22, 1989, USEPA, Region 9, approved the State Board's request and granted authorization for the State of California to issue general NPDES permits.

**E. Background and Rationale for Requirements**

The Regional Board developed the requirements in this WDR based on information submitted as part of the applications for several like agencies, individuals, and entities, through monitoring and reporting programs, and through special studies. Attachments A through F, which contain background information and rationale for WDR requirements, are hereby incorporated into this WDR and constitute part of the Findings for this WDR.

**F. California Environmental Quality Act (CEQA)**

This action to adopt a WDR is exempt from the provisions of CEQA (Public Resources Code section 21100, et seq.) in accordance with CWC section 13389.

**G. Technology-Based Effluent Limitations (TBELs)**

Permits shall include applicable TBELs and standards. (40 CFR § 122.44(a)). This WDR does not include numeric-TBELs because USEPA has not promulgated effluent limitation guidelines for groundwater extraction.

**H. Water Quality-Based Effluent Limitations (WQBELs)**

Permits shall include WQBELs to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water. (40 CFR § 122.44(d)). Where numeric water quality criteria have not been established, WQBELs may be established using USEPA CWA section 304(a) criteria guidance, proposed State criteria or a State policy interpreting narrative criteria supplemented with other relevant information, or an indicator parameter. (40 CFR § 122.44(d)).

**I. Water Quality Control Plan**

The Regional Board's Water Quality Control Plan for the San Diego Basin (hereinafter Basin Plan) designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the Basin Plan. The Basin Plan was adopted by the Regional Board on September 8, 1994, and was subsequently approved by the State Board on December 13, 1994. Subsequent revisions to the Basin Plan have also been adopted by the Regional Board and the State Board.

In addition, State Board Resolution No. 88-63 establishes state policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal and domestic supplies. Requirements of this WDR specifically implement the applicable provisions of the Basin Plan and State Board policy.

**J. National Toxics Rule (NTR) and California Toxics Rule (CTR)**

The USEPA adopted the NTR on December 22, 1992, which was amended on May 4, 1995, and November 9, 1999. The CTR was adopted by USEPA on May 18, 2000, and amended on February 13, 2001. These rules include water quality criteria for priority pollutants and are applicable to these discharges.

**K. State Implementation Policy**

On March 2, 2000, the State Board adopted the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (State Implementation Policy or SIP). The SIP became effective on April 28, 2000, with respect to the priority pollutant criteria promulgated for California by USEPA through the NTR and to the priority pollutant objectives established by the Regional Boards in their Basin Plans, with the exception of the provision on alternate test procedures for individual discharges that have been approved by the USEPA Regional Administrator. The alternate test procedures provision became effective on May 22, 2000. The SIP became effective on May 18, 2000. The SIP includes procedures for determining the need for WQBELs and for calculating WQBELs. The SIP also requires Dischargers to submit sufficient data to make the determination, and if necessary to calculate the

WQBELs. The State Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives, and provisions for chronic toxicity control. Requirements of this WDR implement the SIP.

**L. Compliance Schedules and Interim Requirements**

Current dischargers enrolled in Order No. 2000-90 shall re-enroll no later than 365 days after adoption of this WDR, each discharger currently enrolled in Order No. 2000-90 shall continue to comply with Order No. 2000-90 until obtaining coverage under this WDR.

**M. Antidegradation Policy**

Section 131.12 of 40 CFR requires that State water quality standards include an antidegradation policy consistent with the federal policy. The State Board established California's antidegradation policy in State Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The Regional Boards' Basin Plans implement, and incorporate by reference, both the State and federal antidegradation policies. As discussed in detail in the Fact Sheet, the permitted discharges are consistent with the antidegradation provision of 40 CFR section 131.12 and State Board Resolution No. 68-16.

**N. Anti-Backsliding Requirements**

Sections 402(o)(2) and 303(d)(4) of the CWA and federal regulations of 40 CFR section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. All effluent limitations in this WDR are at least as stringent as the effluent limitations in the previous Order.

**O. Monitoring and Reporting**

Section 122.48 of 40 CFR requires that all NPDES permits specify requirements for recording and reporting monitoring results. Sections 13267 and 13383 of the CWC authorize the Regional Boards to require technical and monitoring reports. The Monitoring and Reporting Program (MRP) establishes monitoring and reporting requirements to implement federal and State requirements. This MRP is provided in Attachment E.

**P. Standard and Special Provisions**

Standard Provisions, which in accordance with 40 CFR sections 122.41 and 122.42 apply to all NPDES discharges and must be included in every NPDES permit, are provided in Attachment D. The Regional Board has also included in this WDR special provisions applicable to the enrolled Dischargers. A rationale for the special provisions contained in this WDR is provided in the attached Fact Sheet (Attachment F).

**Q. Notification of Interested Parties**

The Regional Board has notified the Dischargers, interested agencies and persons of its intent to prescribe WDRs for these discharges, and has provided them with an opportunity to submit their written comments and recommendations. Notification details are provided in the Fact Sheet of this WDR.

**R. Consideration of Public Comment**

The Regional Board, in a public meeting, heard and considered all comments pertaining to the discharges. Details of the Public Hearing are provided in the Fact Sheet of this WDR.

**S. Alaska Rule**

On March 30, 2000, USEPA revised its regulation that specifies when new and revised State and Tribal water quality standards (WQS) become effective for CWA purposes (40 CFR section 131.21, 65 FR 24641, April 27, 2000). Under the revised regulation (also known as the Alaska rule), USEPA must approve new and revised standards submitted to USEPA after May 30, 2000, before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA by May 30, 2000, may be used for CWA purposes, whether or not approved by USEPA.

**IV. Discharge Prohibitions**

- A.** The discharge of wastewater at a location, or in a manner different from that described in the Findings, NOI, or Notice of Enrollment is prohibited.
- B.** The discharge of wastewater shall not create or cause conditions of nuisance or pollution.
- C.** The discharge shall not cause, have a reasonable potential to cause, or contribute to an in-stream excursion above any applicable criterion promulgated by USEPA pursuant to section 303 of the CWA, or water quality objective adopted by the State or Regional Boards.
- D.** The discharge of waste to areas designated by the State Board as being of special (ASBS) biological significance is prohibited. Discharges shall be located a sufficient distance from such designated areas to assure maintenance of natural water quality conditions in these areas.
- E.** The discharge of groundwater extraction wastes from a specific site in excess of the flowrate specified in the Notice of Enrollment from the Regional Board is prohibited, unless the enrollee obtains a revised discharge Notice of Enrollment authorizing an increased flowrate.
- F.** The addition of pollutants to extracted groundwater to be discharged to San Diego Bay is prohibited. The only exception to this prohibition is that chemicals may be added to extracted groundwater to control biofouling in treatment systems, provided that extracted groundwater discharged to San Diego Bay

meets the effluent limitations for such chemicals established by this WDR and in the discharge Notice of Enrollment issued by the Regional Board.

- G. The discharge of groundwater extraction wastes to San Diego Bay is prohibited unless an NOI has been submitted, and the Regional Board has provided the Discharger with a written Notice of Enrollment identifying the discharge subject to waste discharge requirements.
- H. Discharges of waste to San Diego Bay from permanent groundwater extraction operations are prohibited. Groundwater extraction operations for structures which 1) are not designed or constructed to withstand hydrostatic pressure or do not preclude infiltration of groundwater, and 2) require removal of groundwater to prevent water infiltration to the structure(s) are permanent discharges except for the following two existing permanent groundwater extraction discharges currently enrolled in Order 2000-90 until such time the discharges receive an individual permit:
  - a. Embassy Suites Hotel permanent dewatering system
  - b. One America Plaza permanent dewatering system
- I. The discharge of groundwater extraction wastes to San Diego Bay from a construction operation after the date of completion of construction of structures requiring construction groundwater extraction is prohibited.
- J. The discharge of groundwater extraction wastes to San Diego Bay from a groundwater remediation operation after the date groundwater has been remediated to the satisfaction of the Regional Board is prohibited.
- K. Compliance with Discharge Prohibitions contained in the Basin Plan is also required as a condition of this WDR.
- L. Discharges of wastes in a manner, or to a location which have not been specifically regulated by waste discharge requirements of this WDR are prohibited.
- M. The discharge of any radiological, chemical, or biological warfare agent, or high level radiological waste is prohibited.
- N. The dumping or deposition, from shore, of oil, garbage, trash, or other solid municipal, industrial, or agricultural waste directly into waters subject to tidal action or adjacent to waters subject to tidal action in any manner which may permit it to be washed into waters subject to tidal action is prohibited.
- O. The dumping or deposition of chemical agents or explosives into waters subject to tidal action is prohibited.
- P. The discharge of copper from extracted groundwater to the Shelter Island Basin watershed or from the Shelter Island Basin watershed to San Diego Bay is prohibited.

- Q.** The discharge of Diazonon from extracted groundwater to Chollas Creek or from Chollas Creek to San Diego Bay is prohibited.

## V. Effluent Limitations and Discharge Specifications

### A. Effluent Limitations

#### 1. General / Inorganic / Biological

| No. | Parameter               | Units      | Effluent Limitations                    |      |      |                       |                |

 µg/L = micrograms per liter  
 TUa = acute toxicity units  
 TUc = chronic toxicity units  
 lbs/d = pounds per day  
 MGD = million gallons per day

## B. Land Discharge Specifications (Not Applicable)

## C. Reclamation Specifications (Not Applicable)

## VI. Receiving Water Limitations

### A. Surface Water Limitations

Receiving water limitations are based on water quality objectives contained in the Basin Plan and are a required part of this WDR. The discharge of groundwater extraction waste from any site shall not, separately or jointly with any other discharge, cause violations of the following water quality objectives in San Diego Bay. These limitations apply unless more stringent provisions exist in either the Basin Plan, or an applicable State plan. The more stringent limitation shall apply.

## 1. Bacterial Characteristics

### a. Water-Contact Standards

Within a zone bounded by the shoreline and a distance of 1,000 feet from the shoreline or the 30-foot depth contour, whichever is further from the shoreline, and in areas outside this zone used for water-contact sports, as determined by the Regional Board, the following bacterial objectives shall be maintained throughout the water column:

- (1) Samples of water from each sampling station shall have a density of total coliform organisms less than 1,000 per 100 ml (10 per ml); provided that not more than 20 percent of the samples at any sampling station, in any 30-day period, may exceed 1,000 per 100 ml (10 per ml), and provided further that no single sample when verified by a repeat sample taken within 48 hours shall exceed 10,000 per 100 ml (100 per ml).
- (2) The fecal coliform density based on a minimum of not less than five samples for any 30-day period shall not exceed a geometric mean of 200 per 100 ml nor shall more than 10 percent of the total samples during any 60-day period exceed 400 per 100 ml.

### b. Shellfish Harvesting Standards

At all areas where shellfish may be harvested for human consumption, as determined by the Regional Board, the following bacterial objectives shall be maintained throughout the water column:

The median total coliform density shall not exceed 70 per 100 ml, and not more than 10 percent of the samples shall exceed 230 per 100 ml.

## 2. Physical Characteristics

- a. Floating particulates and grease and oil shall not be visible.
- b. The discharge of waste shall not cause aesthetically undesirable discoloration of the surface of San Diego Bay.
- c. Natural light shall not be significantly reduced.
- d. The rate of deposition of solids and the characteristics of inert solids in San Diego Bay sediments shall not be changed such that benthic communities are degraded.

## 3. Chemical Characteristics

- a. The dissolved oxygen concentration shall not at any time be depressed more than 10 percent from that which occurs naturally, as a result of the discharge of oxygen demanding waste materials.
- b. The pH shall not be changed at any time more than 0.2 units from that which occurs naturally.
- c. The dissolved sulfide concentration of waters in and near sediments shall not be significantly increased above that present under natural conditions.
- d. The concentration of substances set forth in the Discharge Specifications in marine sediments shall not be increased to levels which would degrade indigenous biota.

- e. The concentration of organic materials in San Diego Bay sediments shall not be increased to levels which would degrade marine life.
- f. Nutrient materials shall not cause objectionable aquatic growth or degrade indigenous biota.
- 4. Biological Characteristics
  - a. Marine communities, including vertebrate, invertebrate, and plant species, shall not be degraded.
  - b. The natural taste, odor, and color of fish, shellfish, or other aquatic resources used for human consumption shall not be altered.
  - c. The concentration of organic materials in fish, shellfish or other aquatic resources used for human consumption shall not bioaccumulate to levels that are harmful to human health.
- 5. Radioactivity  
Discharge of radioactive waste shall not degrade marine life.
- 6. Toxic Materials Limitations  
Since there is no dilution, toxic materials limits are the same as the effluent limits.

## **B. Groundwater Limitations (Not Applicable)**

## **VII. Provisions**

### **A. Standard Provisions**

- 1. The Discharger shall comply with all Standard Provisions included in Attachment D of this WDR.
- 2. Regional Board Standard Provisions. The Discharger shall comply with the following provisions:
  - a. The Discharger shall comply with all requirements and conditions of this WDR. Any WDR non-compliance constitutes a violation of the CWA and/or of the CWC and is grounds for enforcement action, permit termination, revocation and reissuance, or modification, or for denial of an application for permit renewal, modification, or reissuance.
  - b. The Discharger shall comply with all applicable federal, state, and local laws and regulations for handling, transport, treatment, or disposal of waste or the discharge of waste to waters of the state in a manner which causes or threatens to cause a condition of pollution, contamination or nuisance as those terms are defined in CWC 13050.
  - c. The Porter-Cologne Water Quality Control Act provides for civil and criminal penalties comparable to, and in some cases greater than, those provided for under the CWA.
  - d. Any noncompliance with this WDR is a violation of the CWC and/or the CWA and is grounds for denial of an application for Order renewal or modification.

- e. No discharge of waste into waters of the state, whether or not the discharge is made pursuant to WDRs, shall create a vested right to continue the discharge. All discharges of waste into waters of the state are privileges, not rights.
- f. For the purposes of this WDR, the term "permittee" used in parts of 40 CFR incorporated into this WDR by reference and/or applicable to this WDR shall have the same meaning as the term "Discharger" used elsewhere in this WDR.
- g. This WDR expires on October 10, 2012, after which, the terms and conditions of this WDR are automatically continued pending issuance of a new WDR, provided that all requirements of USEPA's NPDES regulations at 40 CFR 122.6 and the State's regulations at CCR Title 23, Section 2235.4 regarding the continuation of expired Orders and waste discharge requirements are met.
- h. Except as provided for in 40 CFR 122.7, no information or documents submitted in accordance with or in application for this WDR will be considered confidential, and all such information and documents shall be available for review by the public at the office of the Regional Water Board.
- i. A copy of this WDR shall be maintained on-site at the Facility, and shall be available to Regional Water Board, State Water Board, and EPA personnel and/or their authorized representatives at all times.
- j. The Discharger shall comply with any interim limitations established by addendum, enforcement action, or revised waste discharge requirements that have been or may be adopted by the Regional Water Board.
- k. Failure to comply with provisions or requirements of this WDR, or violation of other applicable laws or regulations governing discharges from this facility, may subject the Discharger to administrative or civil liabilities, criminal penalties, and/or other enforcement remedies to ensure compliance. Additionally, certain violations may subject the Discharger to civil or criminal enforcement from appropriate local, state, or federal law enforcement entities.
- l. In the event the Discharger does not comply or will be unable to comply for any reason, with any prohibition, effluent limitation, discharge specification, or receiving water limitation of this WDR, the Discharger shall notify the Regional Water Board by telephone (858) 467-2952 within 24 hours of having knowledge of such noncompliance, and shall confirm this notification in writing within five days, unless the Regional Water Board waives confirmation. The written notification shall state the nature, time, duration, and cause of noncompliance, and shall describe the measures being taken to remedy the current noncompliance and prevent

recurrence including, where applicable, a schedule of implementation. Other noncompliance requires written notification as above at the time of the normal monitoring report.

- m. The Discharger is required to retain records, including all monitoring information and copies of all reports required by this WDR, for five years unless directed otherwise by the Regional Board.
- n. This WDR may be modified, revoked and reissued, or terminated for cause due to promulgation of amended regulations, receipt of USEPA guidance concerning regulated activities, judicial decision, or in accordance with 40 Code of Federal Regulations (CFR) 122.62, 122.63, 122.64, and 124.5.
- o. Enrollment in this WDR is temporary. The enrollee must re-enroll to be subject to the WDR. Dischargers enrolled in this WDR planning to discharge extracted groundwater waste after the expiration date of June 13, 2012 may be subject to new prohibitions or requirements based on the re-issuance of this WDR after June 13, 2012.
- p. The enrollee shall take all reasonable steps to minimize or correct any adverse impact on the environment resulting from noncompliance with this WDR and the Notice of Enrollment from the Regional Board, including such accelerated or additional monitoring as may be necessary to determine the nature, and effect of the noncomplying discharge.
- q. This WDR or the Notice of Enrollment from the Regional Board, may be modified, revoked and reissued, or terminated for cause including, but not limited to, the following:
  - (1) Violation of any terms or conditions of this WDR or the Notice of Enrollment from the Regional Board;
  - (2) Obtaining enrollment in this WDR, or a Notice of Enrollment from the Regional Board, by misrepresentation or failure to disclose fully all relevant facts;
  - (3) A change in any condition that requires either a temporary or permanent reduction or elimination of the discharge subject to waste discharge requirements; or
  - (4) A finding that monitoring "indicator" pollutants listed in this WDR do not ensure compliance with water quality criteria or objectives for the pollutants expected to be represented by the "indicator" pollutants.
- r. The filing of a request by the enrollee for modification, revocation and reissuance, or termination of this WDR or an associated discharge Notice of Enrollment from the Regional Board, or a notification of planned change in or anticipated noncompliance with this WDR or discharge Notice of

Enrollment does not stay any condition of this WDR or the Notice of Enrollment from the Regional Board.

- s. Notwithstanding Provision 2.e above, if any applicable toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under Section 307(a) of the CWA for a toxic pollutant and that standard or prohibition is more stringent than any limitation on the pollutant in this WDR, the Regional Board may institute proceedings under these regulations to modify or revoke and reissue this WDR to conform to the toxic effluent standard or prohibition.
- t. In addition to any other grounds specified herein, this WDR or an Notice of Enrollment from the Regional Board shall be modified or revoked at any time if, on the basis of any data, the Regional Board determines that continued discharges may cause unreasonable degradation of the aquatic environment.
- u. The Regional Board or the Director of the USEPA may require any person requesting enrollment under this WDR or subject to waste discharge requirements under this WDR to apply for and obtain an individual NPDES permit. Cases where an individual NPDES permit may be required include but are not limited to those described in 40 CFR 122.28 (b)(3)(i) and (b)(3)(ii), and where the volume of a discharge exceeds 10 million gallons per year, or the duration of a discharge exceeds 3 years.
- v. It shall not be a defense for the enrollee in an enforcement action that effluent limitation violations are a result of analytical variability rendering the results inaccurate. The validity of the testing results, whether or not the enrollee has monitored or sampled more frequently than required by this WDR, shall not be a defense to an enforcement action.
- w. A copy of this WDR, and the Notice of Enrollment from the Regional Board shall be posted at a prominent location at or near the enrollee's facility, and shall be available to operating personnel at all times.
- x. The enrollee shall take all reasonable steps to minimize or prevent any discharge in violation of this WDR which has a reasonable likelihood of adversely affecting human health or the environment.
- y. For the purposes of this WDR, the term permit, general permit, and order, shall have the same meaning as the term WDR used elsewhere in this WDR.

## **B. Monitoring and Reporting Program Requirements**

The Discharger shall comply with the MRP, and future revisions thereto, in Attachment E of this WDR.

### **C. Special Provisions**

1. Reopener Provisions (Not Applicable)
2. Special Studies, Technical Reports and Additional Monitoring Requirements (Not Applicable)
3. Best Management Practices and Pollution Prevention Plan (Not Applicable)
4. Compliance Schedules (Not Applicable)
5. Construction, Operation and Maintenance Specifications (Not Applicable)
6. Special Provisions for Municipal Facilities (POTWs Only) (Not Applicable)
7. Other Special Provisions

The Dischargers shall dispose of solids removed from liquid wastes in a manner that is consistent with Title 27 of the CCR and approved by the Regional Board.

8. Order No. R9-2007-0034 may be modified by the Regional Board and EPA to enable the discharger to participate in comprehensive regional monitoring activities conducted in the Southern California Bight during the term of this permit. The intent of regional monitoring activities is to maximize the efforts of all monitoring partners using a more cost-effective monitoring design and to best utilize the pooled scientific resources of the region. During these coordinated sampling efforts, the discharger's sampling and analytical effort may be reallocated to provide a regional assessment of the impact of the discharge of municipal wastewater to the Southern California Bight. Anticipated modifications to the monitoring program will be coordinated so as to provide a more comprehensive picture of the ecological and statistical significance of monitoring results and to determine cumulative impacts of various pollution sources. If predictable relationships among the biological, water quality and effluent monitoring variables can be demonstrated, it may be appropriate to decrease the discharger's sampling effort. Conversely, the monitoring program may be intensified if it appears that the objectives cannot be achieved through the discharger's existing monitoring program. These changes will improve the overall effectiveness of monitoring in the Southern California Bight. Minor changes may be made without further public notice.

### **VIII. Compliance Determination**

Compliance with the effluent limitations contained in Section IV of this WDR will be determined as specified below:

#### **A. Average Monthly Effluent Limitation (AMEL)**

If the average of daily discharges over a calendar month exceeds the AMEL for a given parameter, an alleged violation will be flagged and the Discharger will

be considered out of compliance for each day of that month for that parameter (e.g., resulting in 31 days of non-compliance in a 31-day month). The average of daily discharges over the calendar month that exceeds the AMEL for a parameter will be considered out of compliance for that month only. If only a single sample is taken during the calendar month and the analytical result for that sample exceeds the AMEL, the Discharger will be considered out of compliance for that calendar month. For any one calendar month during which no sample (daily discharge) is taken, no compliance determination can be made for that calendar month.

**B. Average Weekly Effluent Limitation (AWEL)**

If the average of daily discharges over a calendar week exceeds the AWEL for a given parameter, an alleged violation will be flagged and the Discharger will be considered out of compliance for each day of that week for that parameter, resulting in seven days of non-compliance. The average of daily discharges over the calendar week that exceeds the AWEL for a parameter will be considered out of compliance for that week only. If only a single sample is taken during the calendar week and the analytical result for that sample exceeds the AWEL, the Discharger will be considered out of compliance for that calendar week. For any one calendar week during which no sample (daily discharge) is taken, no compliance determination can be made for that calendar week.

**C. Maximum Daily Effluent Limitation (MDEL)**

If a daily discharge exceeds the MDEL for a given parameter, an alleged violation will be flagged and the Discharger will be considered out of compliance for that parameter for that one day only within the reporting period. For any one day during which no sample is taken, no compliance determination can be made for that day.

**D. Instantaneous Minimum Effluent Limitation**

If the analytical result of a single grab sample is lower than the instantaneous minimum effluent limitation for a parameter, a violation will be flagged and the Discharger will be considered out of compliance for that parameter for that single sample. Non-compliance for each sample will be considered separately (e.g., the results of two grab samples taken within a calendar day that both are lower than the instantaneous minimum effluent limitation would result in two instances of non-compliance with the instantaneous minimum effluent limitation).

**E. Instantaneous Maximum Effluent Limitation**

If the analytical result of a single grab sample is higher than the instantaneous maximum effluent limitation for a parameter, a violation will be flagged and the Discharger will be considered out of compliance for that parameter for that single sample. Non-compliance for each sample will be considered separately (e.g., the results of two grab samples taken within a calendar day that both exceed the instantaneous maximum effluent limitation would result in two instances of non-compliance with the instantaneous maximum effluent limitation).

#### **F. Six-Month Median Effluent Limitation**

The Discharger shall determine the six-month median effluent value (SMEV) for a given parameter by calculating the statistical median of all daily effluent values (DEVs) for each parameter within each six-month calendar period (January-June and July-December). The SMEV determination for a given six-month calendar period shall not include DEVs from any other six-month calendar period. If only a single DEV is obtained for a parameter during a six-month calendar period, that DEV shall be considered the SMEV for that parameter for that given six-month calendar period. The SMEV shall be attributed to each day of the six-month calendar period for determination of compliance with the six-month median effluent limitation (SMEL) for a given parameter for each day of that given six-month calendar period, resulting in approximately 180 days of non-compliance depending on the number of days in the six-month calendar period. If the SMEV exceeds the six-month median, the Discharger will be considered out of compliance for each day for the six-month period. The SMEV cannot be determined for any six month calendar period during which no DEV is obtained.

## Attachment A – Definitions

**Arithmetic Mean ( $\mu$ ),** also called the average: the sum of measured values divided by the number of samples. For ambient water concentrations, the arithmetic mean is calculated as follows:

Arithmetic mean =  $\mu = \Sigma x / n$       where:  $\Sigma x$  is the sum of the measured ambient water concentrations, and  $n$  is the number of samples.

**Average Monthly Effluent Limitation (AMEL):** the highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

**Average Weekly Effluent Limitation (AWEL):** the highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

**Bioaccumulative Pollutants:** those substances taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

**Carcinogenic Pollutants:** substances that are known to cause cancer in living organisms.

**Coefficient of Variation (CV):** a measure of the data variability and is calculated as the estimated standard deviation divided by the arithmetic mean of the observed values.

**Cone of Depression:** A depression in the water table that develops around a pumped well.

**Cone of Influence:** The depression, roughly conical in shape, produced in a water table by the pumping of water from a well.

**Contamination Site:** A site that is currently under investigation or cleanup for any medium (air, soil, water), or is provided oversight by any local, state, or federal environmental regulatory agency, such as the County of San Diego, Air Pollution Control District, and Department of Toxics Substance Control, or the quality of surface water or groundwater at a site has been altered by wastes to a degree which unreasonably affects either the waters for beneficial uses or facilities which serve these beneficial uses.

**Daily Discharge:** Daily Discharge is defined as either: (1) the total mass of the constituent discharged over the calendar day (12 a.m. through 11:59 p.m.) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or; (2) the unweighted arithmetic mean measurement of the constituent over the day for a

constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day, or other 24-hour period defined as a day), or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if one day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period will be considered as the result for the calendar day in which the 24-hour period ends.

**Detected, but Not Quantified (DNQ):** those sample results less than the Reporting Level (RL), but greater than or equal to the laboratory's Method Detection Limit (MDL).

**Dilution Credit:** the amount of dilution granted to a Discharger in the calculation of a water quality-based effluent limitation, based on the allowance of a specified mixing zone. It is calculated from the dilution ratio, or determined through conducting a mixing zone study, or modeling of the discharge and receiving water.

**Effluent Concentration Allowance (ECA):** a value derived from the water quality criterion/objective, dilution credit, and ambient background concentration that is used, in conjunction with the coefficient of variation for the effluent monitoring data, to calculate a long-term average (LTA) discharge concentration. The ECA has the same meaning as waste load allocation (WLA) as used in USEPA guidance (Technical Support Document For Water Quality-based Toxics Control, March 1991, second printing, EPA/505/2-90-001).

**Enclosed Bays:** indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays include, but are not limited to, Humboldt Bay, Bodega Harbor, Tomales Bay, Drake's Estero, San Francisco Bay, Morro Bay, Los Angeles-Long Beach Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay. Enclosed bays do not include inland surface waters or ocean waters.

**Notice of Enrollment:** A notice from the Regional Board to the discharger that the NOI application has been accepted and the project is enrolled in this WDR. The Notice of Enrollment will specify the discharge flow limit, any additional or increase in monitoring due to specific circumstances of the discharge, or other requirements.

**Estimated Chemical Concentration:** the estimated chemical concentration that results from the confirmed detection of the substance by the analytical method below the Minimum Level value.

**Estuaries:** waters, including coastal lagoons, located at the mouths of streams that serve as areas of mixing for fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars shall be considered

estuaries. Estuarine waters shall be considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and seawater. Estuarine waters included, but are not limited to, the Sacramento-San Joaquin Delta, as defined in Water Code section 12220, Suisun Bay, Carquinez Strait downstream to the Carquinez Bridge, and appropriate areas of the Smith, Mad, Eel, Noyo, Russian, Klamath, San Diego, and Otay rivers. Estuaries do not include inland surface waters or ocean waters.

**Inland Surface Waters:** all surface waters of the State that do not include the ocean, enclosed bays, or estuaries. Inland surface water consist of freshwater and do not have any measurable salinity.

**Instantaneous Maximum Effluent Limitation:** the highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

**Instantaneous Minimum Effluent Limitation:** the lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

**Maximum Daily Effluent Limitation (MDEL):** the highest allowable daily discharge of a pollutant, over a calendar day (or 24-hour period). For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

**Median:** the middle measurement in a set of data. The median of a set of data is found by first arranging the measurements in order of magnitude (either increasing or decreasing order). If the number of measurements ( $n$ ) is odd, then the median =  $X_{(n+1)/2}$ . If  $n$  is even, then the median =  $(X_{n/2} + X_{(n/2)+1})/2$  (i.e., the midpoint between the  $n/2$  and  $n/2+1$ ).

**Method Detection Limit (MDL):** the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in title 40 of the Code of Federal Regulations, Part 136, Attachment B, revised as of July 3, 1999.

**Minimum Level (ML):** the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

**Mixing Zone:** a limited volume of receiving water that is allocated for mixing with a wastewater discharge where water quality criteria can be exceeded without causing adverse effects to the overall water body.

**Not Detected (ND):** those sample results less than the laboratory's MDL.

**Notice of Intent (NOI):** A form completed and signed by a Discharger notifying the Regional Board that the Discharger is applying for enrollment under the terms and conditions of the WDR and will comply with the WDR for a groundwater extraction activity at a specific site.

**Notice of Termination (NOT):** A letter completed and signed by a Discharger notifying the Regional Board that the Discharger no longer wishes to discharge under the WDR. Submission of a NOT constitutes notice that the owner (and his/her agent) of the site identified on the letter has ceased discharge groundwater associated with groundwater extraction activities at the site under this WDR.

**Ocean Waters:** the territorial marine waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. Discharges to ocean waters are regulated in accordance with the State Board's California Ocean Plan.

**Permanent groundwater extraction activities:** Groundwater extraction operations for structures which 1) are not designed or constructed to withstand hydrostatic pressure or do not preclude infiltration of groundwater, and 2) require removal of groundwater to prevent water infiltration to the structure(s).

**Persistent pollutants:** substances for which degradation or decomposition in the environment is nonexistent or very slow.

**Radius of Influence:** The radial distance from the center of a wellbore to the point where there is no lowering of the water table or potentiometric surface (the edge of the cone of depression).

**Reporting Level (RL):** the ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this WDR. The MLs included in this WDR correspond to approved analytical methods for reporting a sample result that are selected by the Regional Board either from Appendix 4 of the SIP in accordance with section 2.4.2 of the SIP, or established in accordance with section 2.4.3 of the SIP. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the RL.

**Satellite Collection System:** the portion, if any, of a sanitary sewer system owned or operated by a different public agency than the agency that owns and operates the wastewater treatment facility that a sanitary sewer system is tributary to.

**Six-Month Median Effluent Limitation:** the highest allowable median of all daily discharges, based on 24-hour flow-weighted composite samples, for any 180-day period.

**Source of Drinking Water:** any water designated as municipal or domestic supply (MUN) in a Regional Board Basin Plan.

**Standard Deviation ( $\sigma$ ):** a measure of variability that is calculated as follows:

$$\sigma = (\sum[(x - \mu)^2]/(n - 1))^{0.5}$$

where:

x is the observed value;

$\mu$  is the arithmetic mean of the observed values; and

n is the number of samples.

**Temporary Discharge:** Discharge of extracted groundwater waste from groundwater cleanup with a projected cleanup date and subsurface excavation that requires groundwater extraction that is not a permanent groundwater extraction activity.

Discharges of groundwater for the purpose of protecting subterranean structures from groundwater infiltration are not considered groundwater cleanup projects, whether or not such discharges cleanup or remove pollutants from the groundwater. These activities may be covered under the statewide general NPDES permit for discharges from utility vaults and underground structures to surface water (CAG990002).

**Toxicity Reduction Evaluation (TRE):** a study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. (A TIE is a set of procedures to identify the specific chemical[s] responsible for toxicity. These procedures are performed in three phases [characterization, identification, and confirmation] using aquatic organism toxicity tests.)

**Waters of the United States or waters of the U.S.:** (40 e-CFR 122.2, March 20, 2007) (a) All waters which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide; (b) All interstate waters, including interstate "wetlands;" (c) All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters: (1) Which are or could be used by interstate or foreign travelers for recreational or other purposes; (2) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or (3) Which are used or could be used for industrial purposes by industries in interstate commerce; (d) All impoundments of waters otherwise defined as waters of the United States under this definition; (e) Tributaries of waters identified in paragraphs (a) through (d) of this definition; (f) The territorial sea; and (g) "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in

paragraphs (a) through (f) of this definition. Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.11(m) which also meet the criteria of this definition) are not waters of the United States. This exclusion applies only to manmade bodies of water which neither were originally created in waters of the United States (such as disposal area in wetlands) nor resulted from the impoundment of waters of the United States. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the Clean Water Act, the final authority regarding Clean Water Act jurisdiction remains with EPA.

Attachment B1 – Notice of Intent Form

## NOTICE OF INTENT

### TO DISCHARGE GROUNDWATER EXTRACTION WASTE TO WATERS OF SAN DIEGO BAY SUBJECT TO GENERAL WASTE DISCHARGE REQUIREMENTS IN ORDER NO. R9-2007-0034 (NPDES NO. CAG919001)

GENERAL WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES FROM  
TEMPORARY GROUNDWATER EXTRACTION AND SIMILAR WASTE DISCHARGES  
TO SAN DIEGO BAY, TRIBUTARIES THERETO UNDER TIDAL INFLUENCE, AND  
STORM DRAINS OR OTHER CONVEYANCE SYSTEMS TRIBUTARY THERETO  
(WDR)

Attach Form 200 (completed and signed) and additional sheets as necessary to provide  
complete information requested in this Notice of Intent (NOI).

#### I. STIPULATION OF APPLICABILITY AND CERTIFICATION

- ☐ I have determined that the groundwater extracted waste discharge will be to navigable waters of the United States within the San Diego Region (i.e. San Diego Bay, tributaries thereto under tidal influence, and storm drains or other conveyance systems tributary thereto) and that any violation of effluent limits will be subject to Mandatory Minimum Penalties under California Water Code section 13385(h) and (i).
- ☐ I have determined that this discharge is eligible for enrollment in this General "Waste Discharge Requirements" (WDR) because the discharge is a temporary discharge, unless exempt and the discharge will comply with the Discharge Specifications of this WDR.
- ☐ I have read this WDR Order No. R9-2007-0034 and hereby certify that:
1. I understand the requirements of Order No. R9-2007-0034.
  2. The enclosed information describing my proposed groundwater extraction waste discharge is accurate and describes a discharge that meets the requirements of Order No. R9-2007-0034, which is the applicable general groundwater extraction waste discharge permit.
  3. I will comply with all terms, conditions, and requirements of WDR Order No. R9-2007-0034.

## I. STIPULATION OF APPLICABILITY AND CERTIFICATION

I certify under penalty of law that this document, Form 200, and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those directly responsible for gathering the information, the information submitted is true, accurate, and complete to the best of my knowledge and belief. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment. In addition, I certify that the provisions of the permit, including the criteria for eligibility will be complied with.

A. Printed Name:

B. Signature\*:

C. Date:

D. Title:

\*Certification by the owner of the facility or the operator of the facility, if the operator is different from the owner, is required. The appropriate person must sign the application form.

Acceptable signatures are:

1. for a corporation, a principal executive officer of at least the level of senior vice-president;
2. for a partnership or individual (sole proprietorship), a general partner or the proprietor;
3. for a governmental or public agency, either a principal executive officer or ranking elected/appointed official.

## II. ITEMS REQUIRED FOR DETERMINING ELIGIBILITY

- ☐ A. Identify and discuss technical and economic feasibility of alternative disposal options.
- ☐ B. If discharging to an MS4, obtain authorization from the appropriate municipality and submit proof.
- ☐ C. Submit scale appropriate vicinity map(s).
- ☐ D. Submit a completed and signed Form 200 (*Application/Report of Waste Discharge, General Information for Waste Discharge Requirements or NPDES Permit*).

### III. NOTICE OF INTENT STATUS

A. Is this a renewal of an expiring WDR? 1. ☐ No 2. ☐ Yes, Order No.: \_\_\_\_\_

### IV. GROUNDWATER EXTRACTION INFORMATION

A. Nature of Groundwater Extraction Activity:

1. ☐ Subsurface Excavation  
a. ☐ Foundation b. ☐ Tunneling c. ☐ Construction d. ☐ Footing e. ☐ Other \_\_\_\_\_
2. ☐ Remediation Project
3. ☐ Other \_\_\_\_\_

B. ☐ This project is associated with a project that requires Regional Board license, permit, or oversight?  
Explain: Construction storm water, 401 Certifications, WDR, UST or cleanup project, etc.

C. Duration and Start Date

1. Proposed Start Date of Groundwater Extraction Discharge: \_\_\_\_\_
2. Estimated Duration of Groundwater Extraction Discharge: \_\_\_\_\_

D. 1. ☐ Describe the historical use of the land within the cone/radius of influence.

2. ☐ Identify all known contamination sites and ground water plumes within half mile of each groundwater extraction points to be used in the project.  
Attach a source description and list of constituents.  
Attach site assessment (If one has been done)

E. For each discharge point identify the location of discharge according to the following: (show in vicinity map)

1. ☐ Storm Drain, ☐ Attach proof of authorization from the appropriate municipality for the discharge into the storm drain or conveyance used to convey the discharge.
2. ☐ Directly into San Diego Bay, ☐ submerged or ☐ on the surface
3. ☐ Freshwater Tributary of San Diego Bay. Distance to San Diego Bay \_\_\_\_\_
4. Salinity of the Tributary at the discharge point \_\_\_\_\_

F. Will treatment be required to meet the Discharge Specifications of this WDR?

1. ☐ Yes 2. ☐ No
- If Yes, attach the following:
- a. ☐ A report certifying the adequacy of each component of the treatment facilities or other type of contingency plan. The report shall also certify that:
- (1) ☐ all treatment facility startup and operation instruction manuals are adequate and available to operating personnel,
  - (2) ☐ adequate treatment facility maintenance and testing (if treatment facilities are on "standby") schedules are included in the treatment facility operations manual,
  - (3) ☐ treatment facilities and appurtenances can be fully operational, as designed, within 24 hours, and
  - (4) ☐ influent and effluent sampling locations or ports are located in areas where samples representative of the waste stream to be monitored can be obtained.
- b. ☐ The design engineer shall affix his/her signature and engineering license number to this certification report.

G. Additional Attachments

1. ☐ Describe best management practices (bmp) and contingency plan.
2. ☐ Provide the results of the analysis of the groundwater to be extracted for all of those constituents, as determined by the sampling requirement criteria described in this WDR, for the proposed receiving water type.

## V. RECEIVING WATER INFORMATION

A. Name of receiving water(s): (San Diego Bay, Chollas Creek, Sweetwater River, etc.)

B. Describe the types of receiving waters affected: (bay, creek, river, etc.)

C. Receiving water flows seasonally 1. ☐ Yes 2. ☐ No

D. More than one discharge point is proposed?

1. ☐ Yes 2. ☐ No If Yes, how many? \_\_\_\_\_

And distance between points \_\_\_\_\_

Include in Vicinity Map

3. Location of Discharge Points: (attach)

Example: Outfall 001 (Latitude and Longitude)

E. Proposed Flow (MGD or gpd) of the discharge:

1. Maximum Discharge: \_\_\_\_\_

2. Average Daily Flowrate: \_\_\_\_\_

3. Basis for flow rate estimates (if necessary attach):

F. Hydrologic Subarea Number(s) at the point of discharge:

## VI. APPLICATION FEE

The initial fee and annual fee are based upon the type of pollutants to be discharged or potentially discharged.

Make checks payable to "SWRCB" and include the project's name in the "memo" field.

☐ **Category 3 Lowest Threat to Water Quality**

The discharge will not require any treatment.

Current fee is \$1,000 plus \$185 surcharge = \$1,185

☐ **Category 2 Moderate Threat to Water Quality**

The discharge will be from a well that has a contaminated site within the radius of influence.

Current fee is \$2,900 plus \$537 surcharge = \$3,437

☐ **Category 1 Highest Threat to Water Quality**

The discharge will require treatment to meet effluent limits.

Current fee is \$4,800 plus \$888 surcharge = \$5,688

## VIII. ANTIDEGREDATION POLICIES

- A. ☐ Statement of compliance with 40 CFR 131.12 and State Water Resources Control Board Resolution No. 68-16 (attach) (collectively antidegradation policies)

### 40 CFR 131.12 Antidegradation policy.

(a) The State shall develop and adopt a statewide antidegradation policy and identify the methods for implementing such policy pursuant to this subpart. The antidegradation policy and implementation methods shall, at a minimum, be consistent with the following:

(1) Existing instream water uses and the level of water quality necessary to protect the existing uses shall be maintained and protected.

(2) Where the quality of the waters exceed levels necessary to support propagation of fish, shellfish, and wildlife and recreation in and on the water, that quality shall be maintained and protected unless the State finds, after full satisfaction of the intergovernmental coordination and public participation provisions of the State's continuing planning process, that allowing lower water quality is necessary to accommodate important economic or social development in the area in which the waters are located. In allowing such degradation or lower water quality, the State shall assure water quality adequate to protect existing uses fully.

Further, the State shall assure that there shall be achieved the highest statutory and regulatory requirements for all new and existing point sources and all cost-effective and reasonable best management practices for nonpoint source control.

(3) Where high quality waters constitute an outstanding National resource, such as waters of National and State parks and wildlife refuges, and waters of exceptional recreational or ecological significance, that water quality shall be maintained and protected.

(4) In those cases where potential water quality impairment associated with a thermal discharge is involved, the antidegradation policy and implementing method shall be consistent with section 316 of the Act.

### RESOLUTION NO. 68-16

#### STATEMENT OF POLICY WITH RESPECT TO MAINTAINING HIGH QUALITY OF WATERS IN CALIFORNIA

WHEREAS the California Legislature has declared that it is the policy of the State that the granting of permits and licenses for unappropriated water and the disposal of wastes into the waters of the State shall be so regulated as to achieve highest water quality consistent with maximum benefit to the people of the State and shall be controlled so as to promote the peace, health, safety and welfare of the people of the State; and

WHEREAS water quality control policies have been and are being adopted for waters of the State; and

WHEREAS the quality of some waters of the State is higher than that established by the adopted policies and it is the intent and purpose of this Board that such higher quality shall be maintained to the maximum extent possible consistent with the declaration of the Legislature;

#### NOW, THEREFORE, BE IT RESOLVED:

1. Whenever the existing quality of water is better than the quality established in policies as of the date on which such policies become effective, such existing high quality will be maintained until it has been demonstrated to the State that any change will be consistent with maximum benefit to the people of the State, will not unreasonably affect present and anticipated beneficial use of such water and will not result in water quality less than that prescribed in the policies.

2. Any activity which produces or may produce a waste or increased volume or concentration of waste and which discharges or proposes to discharge to existing high quality waters will be required to meet waste discharge requirements which will result in the best practicable treatment or control of the discharge necessary to assure that (a) a pollution or nuisance will not occur, and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained.

3. In implementing this policy, the Secretary of the Interior will be kept advised and will be provided with such information as he will need to discharge his responsibilities under the Federal Water Pollution Control Act.

BE IT FURTHER RESOLVED that a copy of this resolution be forwarded to the Secretary of the Interior as part of California's water quality control policy submission.

#### CERTIFICATION

The undersigned, Executive Officer of the State Water Resources Control Board, does hereby certify that the foregoing is a full, true, and correct copy of a resolution duly and regularly adopted at a meeting of the State Water Resources Control Board held on October 24, 1968.

Dated: October 28, 1968

Kerry W. Mulligan, Executive Officer  
State Water Resources Control Board

## IX. CALIFORNIA CONSTITUTION COMPLIANCE

- A. ☐ Discuss the potential uses of the extracted groundwaters, efforts made to ensure use to the fullest extent possible and compliance with Article 10, Section 2 of the California Constitution (attach)

### CALIFORNIA CONSTITUTION

#### ARTICLE 10 WATER

SEC. 2. It is hereby declared that because of the conditions prevailing in this State the general welfare requires that the water resources of the State be put to beneficial use to the fullest extent of which they are capable, and that the waste or unreasonable use or unreasonable method of use of water be prevented, and that the conservation of such waters is to be exercised with a view to the reasonable and beneficial use thereof in the interest of the people and for the public welfare. The right to water or to the use or flow of water in or from any natural stream or water course in this State is and shall be limited to such water as shall be reasonably required for the beneficial use to be served, and such right does not and shall not extend to the waste or unreasonable use or unreasonable method of use or unreasonable method of diversion of water. Riparian rights in a stream or water course attach to, but to no more than so much of the flow thereof as may be required or used consistently with this section, for the purposes for which such lands are, or may be made adaptable, in view of such reasonable and beneficial uses; provided, however, that nothing herein contained shall be construed as depriving any riparian owner of the reasonable use of water of the stream to which the owner's land is riparian under reasonable methods of diversion and use, or as depriving any appropriator of water to which the appropriator is lawfully entitled.

This section shall be self-executing, and the Legislature may also enact laws in the furtherance of the policy in this section contained.

Submit the NOI, first annual fee, map, and other attachments to the following address:

CRWQCB – San Diego Region  
9174 Sky Park Court, Suite 100  
San Diego, CA 92123

## Footnotes to

### Table in paragraph(b)(1) of 40 CFR 131.38 —126 PRIORITY POLLUTANTS:

- a. Criteria revised to reflect the Agency q1\* or RfD, as contained in the Integrated Risk Information System (IRIS) as of October 1, 1996. The fish tissue bioconcentration factor (BCF) from the 1980 documents was retained in each case.
- b. Criteria apply to California waters except for those waters subject to objectives in Tables III-2A and III-2B of the San Francisco Regional Water Quality Control Board's (SFRWQCB) 1986 Basin Plan that were adopted by the SFRWQCB and the State Water Resources Control Board, approved by EPA, and which continue to apply. For copper and nickel, criteria apply to California waters except for waters south of Dumbarton Bridge in San Francisco Bay that are subject to the objectives in the SFRWQCB's Basin Plan as amended by SFRWQCB Resolution R2-2002-0061, dated May 22, 2002, and approved by the State Water Resources Control Board. EPA approved the aquatic life site-specific objectives on January 21, 2003. The copper and nickel aquatic life site-specific objectives contained in the amended Basin Plan apply instead.
- c. Criteria are based on carcinogenicity of 10 (-6) risk.
- d. Criteria Maximum Concentration (CMC) equals the highest concentration of a pollutant to which aquatic life can be exposed for a short period of time without deleterious effects. Criteria Continuous Concentration (CCC) equals the highest concentration of a pollutant to which aquatic life can be exposed for an extended period of time (4 days) without deleterious effects. ug/L equals micrograms per liter.
- e. Freshwater aquatic life criteria for metals are expressed as a function of total hardness (mg/L) in the water body. The equations are provided in matrix at paragraph (b)(2) of this section. Values displayed above in the matrix correspond to a total hardness of 100 mg/l.
- f. Freshwater aquatic life criteria for pentachlorophenol are expressed as a function of pH, and are calculated as follows: Values displayed above in the matrix correspond to a pH of 7.8.  $CMC = \exp(1.005(pH) - 4.869)$ .  $CCC = \exp(1.005(pH) - 5.134)$ .
- g. This criterion is based on 304(a) aquatic life criterion issued in 1980, and was issued in one of the following documents: Aldrin/Dieldrin (EPA 440/5-80-019), Chlordane (EPA 440/5-80-027), DDT (EPA 440/5-80-038), Endosulfan (EPA 440/5-80-046), Endrin (EPA 440/5-80-047), Heptachlor (440/5-80-052), Hexachlorocyclohexane (EPA 440/5-80-054), Silver (EPA 440/5-80-071). The Minimum Data Requirements and derivation procedures were different in the 1980 Guidelines than in the 1985 Guidelines. For example, a "CMC" derived using the 1980 Guidelines was derived to be used as an instantaneous maximum. If assessment is to be done using an averaging period, the values given should be divided by 2 to obtain a value that is more comparable to a CMC derived using the 1985 Guidelines.
- h. These totals simply sum the criteria in each column. For aquatic life, there are 23 priority toxic pollutants with some type of freshwater or saltwater, acute or chronic criteria. For human health, there are 92 priority toxic pollutants with either "water + organism" or "organism only" criteria. Note that these totals count chromium as one pollutant even though EPA has developed criteria based on two valence states. In the matrix, EPA has assigned numbers 5a and 5b to the criteria for chromium to reflect the fact that the list of 126 priority pollutants includes only a single listing for chromium.
- i. Criteria for these metals are expressed as a function of the water-effect ratio, WER, as defined in paragraph (c) of this section.  $CMC = \text{column B1 or C1 value} \times WER$ ;  $CCC = \text{column B2 or C2 value} \times WER$ .
- j. No criterion for protection of human health from consumption of aquatic organisms (excluding water) was presented in the 1980 criteria document or in the 1986 Quality Criteria for Water. Nevertheless, sufficient information was presented in the 1980 document to allow a calculation of a criterion, even though the results of such a calculation were not shown in the document.
- k. The CWA 304(a) criterion for asbestos is the MCL.

I. [Reserved]

- m. These freshwater and saltwater criteria for metals are expressed in terms of the dissolved fraction of the metal in the water column. Criterion values were calculated by using EPA's Clean Water Act 304(a) guidance values (described in the total recoverable fraction) and then applying the conversion factors in §131.36(b)(1) and (2).
- n. EPA is not promulgating human health criteria for these contaminants. However, permit authorities should address these contaminants in NPDES permit actions using the State's existing narrative criteria for toxics.
- o. These criteria were promulgated for specific waters in California in the National Toxics Rule ("NTR"), at §131.36. The specific waters to which the NTR criteria apply include: Waters of the State defined as bays or estuaries and waters of the State defined as inland, i.e., all surface waters of the State not ocean waters. These waters specifically include the San Francisco Bay upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta. This section does not apply instead of the NTR for this criterion.
- p. A criterion of 20 ug/l was promulgated for specific waters in California in the NTR and was promulgated in the total recoverable form. The specific waters to which the NTR criterion applies include: Waters of the San Francisco Bay upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta; and waters of Salt Slough, Mud Slough (north) and the San Joaquin River, Sack Dam to the mouth of the Merced River. This section does not apply instead of the NTR for this criterion. The State of California adopted and EPA approved a site specific criterion for the San Joaquin River, mouth of Merced to Vernalis; therefore, this section does not apply to these waters.
- q. This criterion is expressed in the total recoverable form. This criterion was promulgated for specific waters in California in the NTR and was promulgated in the total recoverable form. The specific waters to which the NTR criterion applies include: Waters of the San Francisco Bay upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta; and waters of Salt Slough, Mud Slough (north) and the San Joaquin River, Sack Dam to Vernalis. This criterion does not apply instead of the NTR for these waters. This criterion applies to additional waters of the United States in the State of California pursuant to 40 CFR 131.38(c). The State of California adopted and EPA approved a site-specific criterion for the Grassland Water District, San Luis National Wildlife Refuge, and the Los Banos State Wildlife Refuge; therefore, this criterion does not apply to these waters.
- r. These criteria were promulgated for specific waters in California in the NTR. The specific waters to which the NTR criteria apply include: Waters of the State defined as bays or estuaries including the San Francisco Bay upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta. This section does not apply instead of the NTR for these criteria.
- s. These criteria were promulgated for specific waters in California in the NTR. The specific waters to which the NTR criteria apply include: Waters of the Sacramento-San Joaquin Delta and waters of the State defined as inland (i.e., all surface waters of the State not bays or estuaries or ocean) that include a MUN use designation. This section does not apply instead of the NTR for these criteria.
- t. These criteria were promulgated for specific waters in California in the NTR. The specific waters to which the NTR criteria apply include: Waters of the State defined as bays and estuaries including San Francisco Bay upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta; and waters of the State defined as inland (i.e., all surface waters of the State not bays or estuaries or ocean) without a MUN use designation. This section does not apply instead of the NTR for these criteria.
- u. PCBs are a class of chemicals which include aroclors 1242, 1254, 1221, 1232, 1248, 1260, and 1016, CAS numbers 53469219, 11097691, 11104282, 11141165, 12672296, 11096825, and 12674112, respectively. The aquatic life criteria apply to the sum of this set of seven aroclors.
- v. This criterion applies to total PCBs, e.g., the sum of all congener or isomer or homolog or aroclor analyses.

w. This criterion has been recalculated pursuant to the 1995 Updates: Water Quality Criteria Documents for the Protection of Aquatic Life in Ambient Water, Office of Water, EPA-820-B-96-001, September 1996. See also Great Lakes Water Quality Initiative Criteria Documents for the Protection of Aquatic Life in Ambient Water, Office of Water, EPA-80-B-95-004, March 1995.

x. The State of California has adopted and EPA has approved site specific criteria for the Sacramento River (and tributaries) above Hamilton City; therefore, these criteria do not apply to these waters.

**40 CFR 131.38 Editorial Note:** At 66 FR 9961, Feb. 13, 2001, §131.38 was amended in the table to paragraph (b)(1) under the column heading for "B Freshwater" by revising the column headings for "Criterion Maximum Concentration" and "Criterion Continuous Concentration"; under the column heading for "C Saltwater" by revising the column headings for "Criterion Maximum Concentration" and "Criterion Continuous Concentration"; and by revising entries "23." and "67.", effective Feb. 13, 2001. However, this is a photographed table and the amendments could not be incorporated into the text. For the convenience of the user, the amended text is set forth as follows:

1) § 131.38 Establishment of Numeric Criteria for priority toxic pollutants for the State of California.

(b)(1) \* \* \*

Attachment C – (Not applicable)

Attachment D – Standard Provisions

## **I. Standard Provisions – Permit Compliance**

### **A. Duty to Comply**

1. The Discharger must comply with all of the conditions of this WDR. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code (CWC) and is grounds for enforcement action, for permit termination, revocation and reissuance, or denial of a permit renewal application. [40 CFR §122.41(a)].
2. The Discharger shall comply with effluent standards or prohibitions established under section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions, even if this WDR has not been modified to incorporate the requirement [40 CFR §122.41(a)(1)].

### **B. Need to Halt or Reduce Activity Not a Defense**

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this WDR [40 CFR §122.41(c)].

### **C. Duty to Mitigate**

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this WDR that has a reasonable likelihood of adversely affecting human health or the environment [40 CFR §122.41(d)].

### **D. Proper Operation and Maintenance**

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this WDR. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this WDR [40 CFR §122.41(e)].

### **E. Property Rights**

1. This WDR does not convey any property rights of any sort or any exclusive privileges [40 CFR §122.41(g)].

2. The issuance of this WDR does not authorize any injury to persons or property or invasion of other private rights, or any infringement of State or local law or regulations [40 CFR §122.5(c)].

#### **F. Inspection and Entry**

The Discharger shall allow the Regional Water Quality Control Board (Regional Board), California State Water Resources Control Board (State Board), United States Environmental Protection Agency (USEPA), and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to [40 CFR §122.41(i)] [CWC 13383(c)]:

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this WDR [40 CFR §122.41(i)(1)];
2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this WDR [40 CFR §122.41(i)(2)];
3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this WDR [40 CFR §122.41(i)(3)];
4. Sample or monitor, at reasonable times, for the purposes of assuring WDR compliance or as otherwise authorized by the CWA or the CWC, any substances or parameters at any location [40 CFR §122.41(i)(4)].

#### **G. Bypass**

1. Definitions
  - a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility [40 CFR §122.41(m)(1)(i)].
  - b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production [40 CFR §122.41(m)(1)(ii)].
2. Bypass not exceeding limitations – The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3 and I.G.5 below [40 CFR §122.41(m)(2)].

3. Prohibition of bypass – Bypass is prohibited, and the Regional Board may take enforcement action against a Discharger for bypass, unless [40 CFR §122.41(m)(4)(i)]:
  - a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage [40 CFR §122.41(m)(4)(A)];
  - b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance [40 CFR §122.41(m)(4)(B)]; and
  - c. The Discharger submitted notice to the Regional Board as required under Standard Provision – Permit Compliance I.G.5 below [40 CFR §122.41(m)(4)(C)].
4. The Regional Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Board determines that it will meet the three conditions listed in Standard Provisions – Permit Compliance I.G.3 above [40 CFR §122.41(m)(4)(ii)].
5. Notice
  - a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass [40 CFR §122.41(m)(3)(i)].
  - b. Unanticipated bypass. The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below [40 CFR §122.41(m)(3)(ii)].

#### H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation [40 CFR §122.41(n)(1)].

1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of paragraph H.2 of this section are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for

- noncompliance, is final administrative action subject to judicial review [40 CFR §122.41(n)(2)].
2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that [40 CFR §122.41(n)(3)]:
    - a. An upset occurred and that the Discharger can identify the cause(s) of the upset [40 CFR §122.41(n)(3)(i)];
    - b. The permitted facility was, at the time, being properly operated [40 CFR §122.41(n)(3)(i)];
    - c. The Discharger submitted notice of the upset as required in Standard Provisions – Reporting V.E.2.b [40 CFR §122.41(n)(3)(iii)]; and
    - d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above [40 CFR §122.41(n)(3)(iv)].
  3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof [40 CFR §122.41(n)(4)].

## **II. Standard Provisions – Permit Action**

### **A. General**

This WDR may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any WDR condition [40 CFR §122.41(f)].

If any toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under section 307(a) of the CWA for a toxic pollutant which is present in the discharge, and that standard or prohibition is more stringent than any limitation on the pollutant in this WDR, this WDR shall be modified or revoked and reissued to conform to the toxic effluent standard or prohibition and the Discharger so notified.

### **B. Duty to Reapply**

If the Discharger wishes to continue an activity regulated by this WDR after the expiration date of this WDR, the Discharger must apply for and obtain a new permit [40 CFR §122.41(b)].

### **C. Transfers**

This Order is not transferable to any person because the Regional Board is required to modify or revoke and reissue this Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the CWC [40 CFR §122.41(l)(3)] [40 CFR §122.61]. Since this is a WDR a new owner or operator shall instead submit an NOI application to enroll in this WDR and the previous owner or operator shall submit a NOT.

### **D. Severability**

The provisions of this WDR are severable and if any provisions of this WDR or the application of any provisions of this WDR to any circumstance is held invalid, the applications of such provision to other circumstances and the remainder of this WDR shall not be affected thereby.

### **E. Pollution, Contamination, or Nuisance [CWC §13050]**

Neither the treatment nor the discharge shall create a condition of pollution, contamination or nuisance.

## **III. Standard Provisions – Monitoring**

- A.** Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity [40 CFR §122.41(j)(1)].
- B.** Monitoring results must be conducted according to test procedures under 40 CFR section 136 or, in the case of sludge use or disposal, approved under 40 CFR section 136 unless otherwise specified in 40 CFR section 503 unless other test procedures have been specified in this WDR [40 CFR §122.41(j)(4)] [40 CFR §122.44(i)(1)(iv)].

## **IV. Standard Provisions – Records**

- A.** Except for records of monitoring information required by this WDR related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by 40 CFR section 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this WDR, and records of all data used to complete the application for this WDR, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Board Executive Officer at any time [40 CFR §122.41(j)(2)].
- B.** Records of monitoring information shall include:
  - 1. The date, exact place, and time of sampling or measurements [40 CFR §122.41(j)(3)(i)];

2. The individual(s) who performed the sampling or measurements [40 CFR §122.41(j)(3)(ii)];
  3. The date(s) analyses were performed [40 CFR §122.41(j)(3)(iii)];
  4. The individual(s) who performed the analyses [40 CFR §122.41(j)(3)(iv)];
  5. The analytical techniques or methods used [40 CFR §122.41(j)(3)(v)]; and
  6. The results of such analyses [40 CFR §122.41(j)(3)(vi)].
- C.** Claims of confidentiality for the following information will be denied [40 CFR §122.7(b)]:
1. The name and address of any permit applicant or Discharger [40 CFR §122.7(b)(1)]; and
  2. Permit applications and attachments, permits and effluent data [40 CFR §122.7(b)(2)].

## **V. Standard Provisions – Reporting**

### **A. Duty to Provide Information**

The Discharger shall furnish to the Regional Board, State Board, or USEPA within a reasonable time, any information which the Regional Board, State Board, or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this WDR or to determine compliance with this WDR. Upon request, the Discharger shall also furnish to the Regional Board, State Board, or USEPA copies of records required to be kept by this WDR [40 CFR §122.41(h)] [CWC 13267].

### **B. Signatory and Certification Requirements**

1. All applications, reports, or information submitted to the Regional Board, State Board, and/or USEPA shall be signed and certified in accordance with paragraph (B.2) and (B.3) of this provision [40 CFR §122.41(k)].
2. All permit applications shall be signed as follows:

- a. For a corporation: By a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (i) A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures [40 CFR §122.22(a)(1)];
  - b. For a partnership or sole proprietorship: by a general partner or the proprietor, respectively [40 CFR §122.22(a)(2)]; or
  - c. For a municipality, State, federal, or other public agency: by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes: (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of USEPA) [40 CFR §122.22(a)(3)].
3. All reports required by this WDR and other information requested by the Regional Board, State Board, or USEPA shall be signed by a person described in paragraph (B.2) of this provision, or by a duly authorized representative of that person. A person is a duly authorized representative only if:
  - a. The authorization is made in writing by a person described in paragraph (B.2) of this provision [40 CFR §122.22(b)(1)];
  - b. The authorization specified either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company (a duly authorized representative may thus be either a named individual or any individual occupying a named position) [40 CFR §122.22(b)(2)]; and

- c. The written authorization is submitted to the Regional Board, State Board, or USEPA [40 CFR §122.22(b)(3)].
4. If an authorization under paragraph (B.3) of this provision is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of paragraph (B.3) of this provision must be submitted to the Regional Board, State Board or USEPA prior to or together with any reports, information, or applications, to be signed by an authorized representative [40 CFR §122.22(c)].
5. Any person signing a document under paragraph (B.2) or (B.3) of this provision shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations" [40 CFR §122.22(d)].

### C. Monitoring Reports

1. Monitoring results shall be reported at the intervals specified in the MRP in this WDR [40 CFR §122.41(l)(4)].
2. Monitoring results must be reported on a Self-Monitoring Report (SMR) form or forms provided or specified by the Regional Board or State Board for reporting results of monitoring of sludge use or disposal practices [40 CFR §122.41(l)(4)(i)].
3. If the Discharger monitors any pollutant more frequently than required by this WDR using test procedures approved under 40 CFR section 136 or, in the case of sludge use or disposal, approved under 40 CFR section 136 unless otherwise specified in 40 CFR section 503, or as specified in this WDR, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the SMR or sludge reporting form specified by the Regional Board [40 CFR §122.41(l)(4)(ii)].
4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this WDR [40 CFR §122.41(l)(4)(iii)].

#### D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this WDR, shall be submitted no later than 14 days following each schedule date [40 CFR §122.41(l)(5)].

#### E. Twenty-Four Hour Reporting

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance [40 CFR §122.41(l)(6)(i)].
2. The following shall be included as information that must be reported within 24 hours under this paragraph [40 CFR §122.41(l)(6)(ii)]:
  - a. Any unanticipated bypass that exceeds any effluent limitation in this WDR [40 CFR §122.41(l)(6)(ii)(A)].
  - b. Any upset that exceeds any effluent limitation in this WDR [40 CFR §122.41(l)(6)(ii)(B)].
  - c. Violation of a maximum daily discharge limitation for any of the pollutants listed in this WDR to be reported within 24 hours [40 CFR §122.41(l)(6)(ii)(C)].
3. The Regional Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours [40 CFR §122.41(l)(6)(iii)].

#### F. Planned Changes

The Discharger shall give notice to the Regional Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when [40 CFR §122.41(l)(1)]:

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR §122.29(b) [40 CFR §122.41(l)(1)(i)]; or
2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which

are subject neither to effluent limitations in this WDR nor to notification requirements under 40 CFR section 122.42(a)(1) (see Additional Provisions—Notification Levels VII.A.1) [40 CFR §122.41(l)(1)(ii)]; or

3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan [40 CFR §122.41(l)(1)(iii)].

#### **G. Anticipated Noncompliance**

The Discharger shall give advance notice to the Regional Board or State Board of any planned changes in the permitted facility or activity that may result in noncompliance with the requirements of this WDR [40 CFR §122.41(l)(2)].

#### **H. Other Noncompliance**

The Discharger shall report all instances of noncompliance not reported under Standard Provisions – Reporting E.3, E.4, and E.5 at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E [40 CFR §122.41(l)(7)].

#### **I. Discharge Monitoring Quality Assurance (DMQA) Program [STATE WATER BOARD/USEPA 106 MOA]**

The Discharger shall conduct appropriate analyses on any sample provided by USEPA as part of the DMQA program. The results of such analyses shall be submitted to USEPA's DMQA manager.

#### **J. Other Information**

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Board, State Board, or USEPA, the Discharger shall promptly submit such facts or information [40 CFR §122.41(l)(8)].

### **VI. Standard Provisions – Enforcement**

- A. The CWA provides that any person who violates section 301, 302, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any such sections in a permit issued under section 402, or any requirement imposed in a pretreatment program approved under sections 402(a)(3) or 402(b)(8) of the Act, is subject to a civil penalty not to exceed \$25,000 per day for each violation. The CWA provides that any person who negligently violates sections 301, 302, 306, 307, 308, 318, or 405 of the Act, or any condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, or any requirement imposed in a pretreatment program approved

under section 402(a)(3) or 402(b)(8) of the Act, is subject to criminal penalties of \$2,500 to \$25,000 per day of violation, or imprisonment of not more than one (1) year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more than \$50,000 per day of violation, or by imprisonment of not more than two (2) years, or both. Any person who knowingly violates such sections, or such conditions or limitations is subject to criminal penalties of \$5,000 to \$50,000 per day of violation, or imprisonment for not more than three (3) years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than \$100,000 per day of violation, or imprisonment of not more than six (6) years, or both. Any person who knowingly violates section 301, 302, 303, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, and who knows at that time that he thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of not more than \$250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than \$500,000 or by imprisonment of not more than 30 years, or both. An organization, as defined in section 309(c)(3)(B)(iii) of the CWA, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than \$1,000,000 and can be fined up to \$2,000,000 for second or subsequent convictions [40 CFR §122.41(a)(2)] [CWC 13385 and 13387].

- B.** Any person may be assessed an administrative penalty by the Regional Board for violating CWA section 301, 302, 306, 307, 308, 318 or 405, or any permit condition or limitation implementing any of such sections in a permit issued under CWA section 402. Administrative penalties for Class I violations are not to exceed \$10,000 per violation, with the maximum amount of any Class I penalty assessed not to exceed \$25,000. Penalties for Class II violations are not to exceed \$10,000 per day for each day, during which the violation continues, with the maximum amount of any Class II penalty not to exceed \$125,000 [40 CFR §122.41(a)(3)].
- C.** The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than \$10,000, or by imprisonment for not more than two years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than \$20,000 per day of violation, or by imprisonment of not more than four years, or both [40 CFR §122.41(j)(5)].
- D.** The CWA provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this WDR, including monitoring reports or reports of compliance or noncompliance shall, upon conviction, be punished by

a fine of not more than \$10,000 per violation, or by imprisonment for not more than six months per violation, or by both [40 CFR §122.41(k)(2)].

## **VII. Additional Provisions – Notification Levels**

### **A. Non-Municipal Facilities**

Dischargers of existing manufacturing, commercial, mining, and silvicultural wastes shall notify the Regional Board as soon as they know or have reason to believe [40 CFR §122.42(a)]:

1. That any activity has occurred or will occur that would result in the discharge, on a routine or frequent basis, of any toxic pollutant that is not limited in this WDR, if that discharge will exceed the highest of the following "notification levels" [40 CFR §122.42(a)(1)]:
  - a. 100 micrograms per liter (µg/L) [40 CFR §122.42(a)(1)(i)];
  - b. 200 µg/L for acrolein and acrylonitrile; 500 µg/L for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/L) for antimony [40 CFR §122.42(a)(1)(ii)];
  - c. Five (5) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge [40 CFR §122.42(a)(1)(iii)]; or
  - d. The level established by the Regional Board in accordance with 40 CFR section 122.44(f) [40 CFR §122.42(a)(1)(iv)].
2. That any activity has occurred or will occur that would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant that is not limited in this WDR, if that discharge will exceed the highest of the following "notification levels" [40 CFR §122.42(a)(2)]:
  - a. 500 micrograms per liter (µg/L) [40 CFR §122.42(a)(2)(i)];
  - b. 1 milligram per liter (mg/L) for antimony [40 CFR §122.42(a)(2)(ii)];
  - c. Ten (10) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge [40 CFR §122.42(a)(2)(iii)]; or
  - d. The level established by the Regional Board in accordance with 40 CFR §122.44(f) [40 CFR §122.42(a)(2)(iv)].

### **B. Publicly-Owned Treatment Works (POTWs) (Not Applicable)**

## Attachment E – Monitoring and Reporting Program (MRP)

Title 40 of the Code of Federal Regulations (CFR) section 122.48 requires that all National Pollutant Discharge Elimination System (NPDES) permits specify monitoring and reporting requirements. California Water Code sections 13267 and 13383 also authorize the California Regional Water Quality Control Board (Regional Board) to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements, which implement the federal and California regulations.

### I. General Monitoring Provisions

- A. Samples and measurements taken as required herein shall be representative of the volume and nature of the monitored discharge. All samples shall be taken at the monitoring location identified in the representative sampling and analysis program. Another waste stream, body of water, or substance shall not dilute the monitored discharge. Monitoring points shall not be changed without notification to and the approval of the appropriate Regional Board.
- B. Monitoring must be conducted according to USEPA test procedures approved under 40 CFR section 136, Guidelines Establishing Test Procedures for the Analysis of Pollutants Under the Clean Water Act as amended, unless other test procedures are specified in this WDR and/or by the appropriate Regional Board.
- C. If the Discharger monitors any pollutant more frequently than required by this WDR using test procedures approved under 40 CFR section 136, or as specified in this WDR or by the appropriate Regional Board, the results of the monitoring shall be included in the calculation and reporting of the data submitted in the Discharger's Annual Report. The increased frequency of monitoring shall also be reported.
- D. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this WDR.
- E. All analyses shall be performed in a laboratory certified to perform such analyses by the California Department of Health Services or a laboratory approved by the Regional Board.
- F. All monitoring instruments and devices used by the Discharger to fulfill the monitoring program shall be properly maintained and calibrated to ensure accuracy. All flow measurement devices shall be calibrated at least once per year to ensure accuracy of the devices.
- G. Order No. R9-2007-0034 may be modified by the Regional Board and EPA to enable the discharger to participate in comprehensive regional monitoring activities conducted in the Southern California Bight during the term of this permit. The intent of regional monitoring activities is to maximize the efforts of all monitoring partners using a more cost-effective monitoring design and to best utilize the pooled scientific resources of the region. During these coordinated sampling efforts, the discharger's sampling and analytical effort may be

reallocated to provide a regional assessment of the impact of the discharge of municipal wastewater to the Southern California Bight. Anticipated modifications to the monitoring program will be coordinated so as to provide a more comprehensive picture of the ecological and statistical significance of monitoring results and to determine cumulative impacts of various pollution sources. If predictable relationships among the biological, water quality and effluent monitoring variables can be demonstrated, it may be appropriate to decrease the discharger's sampling effort. Conversely, the monitoring program may be intensified if it appears that the objectives cannot be achieved through the discharger's existing monitoring program. These changes will improve the overall effectiveness of monitoring in the Southern California Bight. Minor changes may be made without further public notice.

## **II. Monitoring Locations**

- A.** Dischargers enrolling for the first time under this WDR shall develop a representative sampling and analysis program to be used as case studies to represent the typical types of discharges occurring within their service areas. This study, to be submitted as the first annual report, will include the monitoring locations and rationale for choosing those locations.
- B.** Re-enrollees must submit a new case study defining monitoring locations and rationale for these locations, if there are new types of discharges.

## **III. Influent Monitoring Requirements (Not Applicable)**

## **IV. Effluent Monitoring Requirements**

- A.** Dischargers who are enrolling for the first time under this WDR shall develop a representative sampling and analysis program based on the discharge anticipated from the extracted groundwater activity as compared to the Effluent Limitations and Discharge Specifications established in this Permit to ensure the discharge will not violate Regional Board Discharge Prohibitions.
- B.** The Regional Board may increase monitoring requirements on a case-by-case basis. Additional monitoring for individual discharges may be required, where necessary, to show that during the term of the discharge, applicable water quality objectives will be maintained.
- C. Treatment System Status**  
The daily status (e.g., onsite, in operation/on standby, etc.) of any treatment systems used to achieve compliance with this WDR or the Notice of Enrollment from the Regional Board shall be reported monthly.
- D. Initial and Annual Monitoring Program**

The discharger shall, initially and on an annual basis, sample the constituents from the Annual Monitoring Program A below for discharge flows under 50,000

gallons per day (gpd) or from the Annual Monitoring Program B below for discharge flows of 50,000 gpd or more.

Annual Monitoring Program A consists of the 38 constituents from Section V. Effluent Limitations and Discharge Specifications of this WDR.

Annual Monitoring Program B consists of the following constituents: The 38 constituents from Section V. Effluent Limitations and Discharge Specifications and the 126 constituents from Attachment B2 – Priority Toxic Pollutants of this WDR.

## E. Discharge Monitoring

The minimum frequency of analysis for constituents listed below identified with an asterisk (\*), that are reported as non-detect (ND) for two consecutive monitoring periods may be decreased from; every other week to monthly; every other month to quarterly; and quarterly to semiannually, after notification from the Regional Board. The reporting frequency does not change.

Discharge monitoring shall be conducted as follows:

| Constituent                      | Analyzed Sample |      | Reporting and Calculated Values |              |      |              |                | Frequency of Monitoring | Frequency of Reporting |
|----------------------------------|-----------------|------|---------------------------------|--------------|------|--------------|----------------|-------------------------|------------------------|
|                                  | Lab Results     |      | Inst. Max                       | MDEL         | AWEL | AMEL         | 6-Month Median |                         |                        |
|                                  | Units           | Type | Units                           |              |      |              |                |                         |                        |
| General / Inorganic / Biological |                 |      |                                 |              |      |              |                |                         |                        |
| Flow                             | MGD             | N/A  | MGD                             |              |      |              |                | Daily                   | Monthly                |

† for Groundwater Extraction Operations associated with Sewer System Replacement Construction Projects.

Laboratories analyzing monitoring samples shall be certified by the Department of Health Services, in accordance with the provision of Water Code Section 13176, and must include quality assurance/quality control data with their reports.

The results of such analysis shall be reported in the annual report. Grab samples shall be collected at the applicable point of discharge (either at the storm drain or the receiving water). If a Discharger monitors the above constituents more frequently than required by this WDR, then the results of such monitoring shall be included in the calculation and reporting of the data submitted in the annual report. Separate annual reports are required for each region.

- F.** The Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this WDR, and records of all data used to complete the application for this WDR, for a period of at least five years from the date of the sample, measurement, report, or application. This period may be extended by request of this Regional Board. These records shall include:

1. The date, place, and time of site inspections, sampling, visual observation, and/or measurement;
2. The individual(s) who performed the site inspections, sampling, visual observations, and/or measurements;
3. The dimension, size and/or volume of vault;
4. Flow measurements (if required) and duration of discharge;
5. The estimated volume of discharge;
6. The date and time of analyses;
7. The laboratory, staff, or wholesaler who performed the analyses; and
8. Analytical results.

**G.** Toxicity Reduction Evaluation (TRE)

The enrollee shall develop a Toxicity Reduction Evaluation (TRE) workplan. The workplan shall be subject to the approval of the Regional Board and shall be modified as directed by the Regional Board. Enrollees shall submit the TRE workplan to the Regional Board upon request of the Regional Board. The TRE workplan shall be developed no later than six months after adoption of this WDR in accordance with the following manuals:

1. Generalized Methodology for Conducting Industrial Toxicity Reduction Evaluations (EPA/600/2-88/070).
2. Toxicity Identification Evaluation (TIE), Phase I (EPA/600/6-91/005F).

3. Methods for Aquatic Toxicity Identification Evaluations, Phase II (EPA/600/R-92/080).
  4. Methods for Aquatic Toxicity Identification Evaluations, Phase III (EPA/600/R-92/081).
- H. If toxicity-testing results show a violation of any acute toxicity limitation identified in Discharge Specifications of this WDR, the enrollee shall:
1. Take all reasonable measures necessary to immediately minimize toxicity; and
  2. Increase the frequency of the toxicity test(s), which showed a violation, to at least two times per month until the results of at least two consecutive toxicity tests do not show violations.
- I. If the Regional Board determines that toxicity testing shows consistent violation of any acute toxicity limitation identified in Discharge Specifications of this WDR, the enrollee shall conduct a TRE that includes all reasonable steps to identify the source of toxicity. Once the source of toxicity is identified, the enrollee shall take all reasonable steps to reduce the toxicity to meet the toxicity limitations identified in Discharge Specifications of this WDR.
- J. Within 14 days of completion of the TRE, the enrollee shall submit the results of the TRE, including a summary of the findings, data generated, a list of corrective actions necessary to achieve consistent compliance with all the toxicity limitations of this WDR and to prevent recurrence of violations of those limitations, and a time schedule for implementation of such corrective actions. The corrective actions and time schedule shall be modified at the direction of the Regional Board.
- V. Whole Effluent Toxicity Testing Requirements (Not Applicable)**
- VI. Land Discharge Monitoring Requirements (Not Applicable)**
- VII. Reclamation Monitoring Requirements (Not Applicable)**
- VIII. Receiving Water Monitoring Requirements – SURFACE WATER AND GROUNDWATER (Not Applicable)**
- IX. Other Monitoring Requirements (Not Applicable)**
- X. Reporting Requirements**
- A. General Monitoring and Reporting Requirements

All reports submitted in response to this WDR shall comply with signatory requirements set forth in the Standard Provisions.

**B. Self Monitoring Reports (SMRs) to State and Regional Board**

1. At any time during the term of this permit, the State or Regional Board may notify the Discharger to electronically submit Self-Monitoring Reports (SMRs) using the State Board's California Integrated Water Quality System (CIWQS) Program Web site (<http://www.waterboards.ca.gov/ciwqs/index.html>). Until such notification is given, the Discharger shall submit hard copy SMRs. The CIWQS Web site will provide additional directions for SMR submittal in the event there will be service interruption for electronic submittal.
2. The Discharger shall submit annual monitoring results to the Regional Board by the 20th day of March for the preceding calendar year. The Discharger shall report in the SMR the results for all monitoring specified in this MRP. The Discharger shall submit annual SMRs including the results of all required monitoring using USEPA-approved test methods or other test methods specified in this WDR. If the Discharger monitors any pollutant more frequently than required by this WDR, the results of this monitoring shall be included in the calculations and reporting of the data submitted in the SMR.
3. The Discharger shall submit SMRs in accordance with the following requirements:
  - a. The Discharger shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the facility is operating in compliance with interim and/or final effluent limitations. The Discharger is not required to duplicate the submittal of data that are entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format within the system, the Discharger shall electronically submit the data in a tabular format as an attachment.
  - b. The Discharger shall attach a cover letter to the SMR. The information contained in the cover letter shall clearly identify violations of this WDR; discuss corrective actions taken or planned; and the proposed time schedule for corrective actions. Identified violations must include a description of the requirement that was violated and a description of the violation.
  - c. SMRs must be submitted to the appropriate Regional Board, signed and certified as required by the Standard Provisions (Attachment D).

**C. Self-Monitoring Reports (SMRs) to EPA**

When requested by USEPA, the Discharger shall also complete and submit Self-Monitoring Reports to USEPA. The submittal date shall be specified in the request.

**D. OTHER REPORTS (NOT APPLICABLE)**

## Attachment F – Fact Sheet

As described in section III of this WDR, this Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this WDR.

### I. Permit Information

#### A. INTRODUCTION

This Order establishes a WDR regulating the discharge of groundwater extraction waste discharges to San Diego Bay, tributaries thereto under tidal influence, and storm drains or other conveyance systems tributary thereto from all temporary construction groundwater extraction, and similar waste discharges.

#### B. BACKGROUND

In 1972, the Federal Water Pollution Control Act, currently referred to as the Federal Clean Water Act (CWA), was amended to provide that the discharge of pollutants to waters of the United States from any point source is prohibited, unless the discharge is in compliance with a National Pollutant Discharge Elimination System (NPDES) permit. The federal regulations allow authorized states to issue either general permits or individual permits to regulate discharges of pollutants to waters of the United States. On April 23, 1990, the California Regional Water Quality Control Board, San Diego Region (Regional Board) issued a general permit for groundwater extraction waste discharges to San Diego Bay and tributaries thereto (Order No. 90-31). The permit was reissued two more times on May 16, 1995 (Order No. 95-25) and June 14, 2000 (Order No. 2000-90).

Order No. 2000-90 regulated temporary groundwater extraction discharges to San Diego Bay and prohibited permanent groundwater extraction discharges. However, Order No. 2000-90 exempted three pre-existing permanent groundwater extraction discharges that were enrolled in the Order No. 95-25 when Order No. 2000-90 was adopted. They were, the City of San Diego, San Diego Convention Center permanent dewater system, the Embassy Suites Hotel permanent dewatering system, and the One America Plaza permanent dewatering system. On March 12, 2003, the City of San Diego was issued an individual NPDES permit for the discharge of extracted groundwater waste from the San Diego Convention Center. As of the date of adoption of this WDR, the following two existing permanent groundwater extraction discharges enrolled in Order No. 2000-90 will continue to be regulated in this WDR.

- a. Embassy Suites Hotel permanent dewatering system
- b. One America Plaza permanent dewatering system

In accordance with Title 40, Code of Federal Regulations (CFR), the Regional Board must meet general program requirements prior to the re-issuance and adoption of a general NPDES permit. General program requirements include

preparing a draft WDR, public noticing, allowing a public comment period, and conducting a public hearing. To meet these requirements, the Regional Board prepared a draft WDR. The first draft WDR was made available to interested parties on April 27, 2007 for comments and an updated draft was available on August 28, 2007. A public hearing to receive testimony from interested parties was scheduled for October 10, 2007. The Notice of Public Hearing was sent to the interested party list. A public hearing notice was also posted in major newspapers in the San Diego Region.

### C. GENERAL CRITERIA

This WDR is intended to cover temporary discharges of pollutants to San Diego Bay and its tributaries under tidal influence from groundwater extraction due to construction and other groundwater extraction activities. To be subject to waste discharge requirements by this WDR, Dischargers must meet the following criteria:

1. The discharge of any flow of extracted groundwater into San Diego Bay.
2. The discharge of groundwater extraction wastes will not be permanent. Groundwater extraction operations for structures which 1) are not designed or constructed to withstand hydrostatic pressure or do not preclude infiltration of groundwater, and 2) require removal of groundwater to prevent water infiltration to the structure(s) are permanent discharges.
3. Pollutant concentrations in the discharge will comply with the Discharge Specifications of this WDR.

This WDR does not cover:

PERMANENT DISCHARGES – Groundwater extraction operations for structures which 1) are not designed or constructed to withstand hydrostatic pressure or do not preclude infiltration of groundwater, and 2) require removal of groundwater to prevent water infiltration to the structure(s) are permanent discharges except for the following two existing permanent groundwater extraction discharges currently enrolled in Order 2000-90 until such time the discharges receive an individual permit:

- c. Embassy Suites Hotel permanent dewatering system
- d. One America Plaza permanent dewatering system

STORM WATER - Storm water runoff due to construction activities. These activities may be covered under the statewide general NPDES permit for storm water discharges associated with construction activities (CAS000002), the statewide general NPDES permit for Storm Water Runoff Associated With Small Linear Underground/Overhead Construction Projects (CAS000005), and/or Clean Water Act (CWA) Section 401 Water Quality Certifications.

**SANITARY SEWER** - Discharges to a sanitary sewer. These discharges do not need coverage under the NPDES Program, although the agency controlling the sanitary sewer must approve discharges to its conveyance system.

**UTILITY VAULTS** - Discharges from utility vaults and underground structures. These activities may be covered under the statewide general NPDES permit for discharges from utility vaults and underground structures to surface water (CAG990002).

**HYDROSTATIC/ POTABLE WATER** – Discharges from drinking water well development. These discharges are covered in Order No. R9-2002-0020.

#### Notification Requirements

The purpose of this WDR is to facilitate regulation of discharges from groundwater extraction activities. To obtain coverage under this WDR, the Discharger must submit a Notice of Intent (NOI), a project map(s), an initial Monitoring Report, and first annual fee. Signing the certification on the NOI signifies that the Discharger intends to comply with the provisions and requirements of this WDR. An NOI must be signed to be valid.

#### **D. DISCHARGE TO A MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4)**

Local agencies responsible for operating the MS4s may not passively receive and discharge pollutants from third parties. By providing free and open access to an MS4 that conveys discharges to waters of the U.S., the MS4 operator essentially accepts responsibility for discharges into the MS4 that it does not prohibit or control. These discharges may cause or contribute to a condition of contamination or a violation of water quality standards.

Prior to discharging into an MS4, the Discharger shall demonstrate alternatives to discharging extracted groundwater waste into an MS4 and why it is technically or economically infeasible to implement these alternatives.

Without prior approval from the appropriate local agency with jurisdiction over the MS4, the discharger shall not discharge extracted groundwater waste under this WDR into an MS4.

Therefore, at least 30 days prior to initiating an extracted groundwater discharge to an MS4, the Discharger shall notify and receive authorization from the appropriate local agency with jurisdiction over the MS4. This requirement encourages communication between Dischargers enrolled under this WDR and local agencies responsible for MS4s in an effort to reduce misunderstandings and concerns over the types of discharges covered by this WDR.

#### **E. DISCHARGE DESCRIPTION**

Existing and proposed discharges of groundwater extraction waste to San Diego Bay from construction dewatering, foundation dewatering, and groundwater

cleanup projects: 1) result from similar operations (all involve extraction and discharge of groundwater), 2) are the same type of waste (all are groundwater), 3) require similar effluent limitations for the protection of the beneficial uses of San Diego Bay, 4) require the issuance of a permit in a short time period because the nature of the project is short term, 5) require similar monitoring, and 6) are more appropriately regulated under a general permit rather than an individual permit.

Much of the groundwater in the downtown San Diego area contains petroleum products and solvents, mainly resulting from underground storage tank leaks and pipeline leaks.

**F. DESCRIPTION OF WASTEWATER AND BIOSOLIDS TREATMENT OR CONTROLS (NOT APPLICABLE)**

**G. DISCHARGE POINTS AND RECEIVING WATERS**

San Diego Bay has a surface area of approximately 18.5 square miles and is surrounded by metropolitan San Diego. Most of the shore line has been heavily developed for recreational, residential, military, and industrial use.

Under the WDR, there may be multiple discharge points. Additional information regarding the receiving waters can be found in the completed NOI which describes the discharge and identifies the points of discharge.

Storm drains are not designed to maximize initial dilution; therefore, this WDR uses zero initial dilution factor. In addition, the Regional Board has the practice not to consider dilution when setting water quality-based effluent limitations for discharges to bays and estuaries unless the dilution ratio is verified with field data. Since this is a WDR without existing data points, no dilution credit is considered for the discharge.

**H. SUMMARY OF EXISTING REQUIREMENTS AND SELF-MONITORING REPORT DATA**

Order No. 2000-90, which this WDR replaces, requires the Discharger not to exceed the Effluent Limitations for a number of constituents, and to monitor and report these constituents. Significant changes occurred in the Effluent Limitation requirements for some constituents. Effluent Limitations under Order No. 2000-90 were developed using the CTR, while the SIP was used for this WDR.

**I. Compliance Summary (Not Applicable)**

**J. Planned Changes (Not Applicable)**

**II. Applicable Plans, Policies, and Regulations**

The requirements contained in this WDR are based on the requirements and authorities described in this section.

## **A. Legal Authorities**

This WDR is issued pursuant to CWA section 402 and implementing regulations adopted by the USEPA and Chapter 5.5, Division 7 of the California Water Code (CWC). It shall serve as an NPDES permit for point source discharges from groundwater extraction waste discharges to surface waters. This WDR also serves as Waste Discharge Requirements (WDRs) pursuant to Article 4, Chapter 4 of the CWC for discharges that are not subject to regulation under CWA section 402.

States may request authority to issue general NPDES permits pursuant to 40 CFR section 122.28. On June 8, 1989, the State Board submitted an application to the USEPA requesting revisions to its NPDES Program in accordance with 40 CFR 122.28, 123.62, and 403.10. The application included a request to add WDR authority to its approved NPDES Program. On September 22, 1989, the USEPA, Region 9, approved the State Board's request and granted authorization for the State to issue general NPDES permits.

## **B. California Environmental Quality Act (CEQA)**

This action to adopt a NPDES permit is exempt from the provisions of CEQA (Public Resources Code section 21100, et seq.) in accordance with CWC section 13389 for the following reasons: 1) A Discharger cannot obtain coverage under this WDR if pollutants in the discharge, cause, contribute, or have the reasonable potential to cause or contribute to a water quality standards violation; 2) The permit requires Dischargers to monitor and report the discharge to ensure the Dischargers will not cause a violation; and 3) The Regional Board's granting of the exceptions does not have the potential for causing significant adverse environmental effects. See California Code of Regulations, Title 14, section 15061(b)(3).

## **C. State and Federal Regulations, Policies, and Plans**

### **1. Water Quality Control Plan**

On September 8, 1994, the Regional Board adopted a Water Quality Control Plan for the San Diego Region (hereinafter Basin Plan), that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. In addition, State Board Resolution No. 88-63 requires that, with certain exceptions, the Regional Board assigns the municipal and domestic supply use to water bodies that do not have beneficial uses listed in the Basin Plans.

Beneficial uses applicable to San Diego Bay waters are as follows:

- a. Industrial service supply;
- b. Navigation;
- c. Contact water recreation;
- d. Non-contact water recreation;
- e. Ocean commercial and sport fishing;

- f. Preservation of rare, threatened or endangered species;
  - g. Marine habitat;
  - h. Fish migration;
  - i. Shellfish harvesting;
  - j. Fish spawning;
  - k. Wildlife habitat;
  - l. Preservation of areas of special biological significance; and
  - m. Mariculture.
2. **National Toxics Rule (NTR) and California Toxics Rule (CTR)**  
USEPA adopted the NTR on December 22, 1992, which was amended on May 4, 1995, and November 9, 1999, and the CTR on May 18, 2000, which was amended on February 13, 2001. These rules include water quality criteria for priority pollutants and are applicable to this discharge.
3. **State Implementation Policy (SIP)**  
On March 2, 2000, the State Board adopted the SIP, which became effective on April 28, 2000, with respect to the priority pollutant criteria promulgated for California by the USEPA through the NTR and to the priority pollutant objectives established by the Regional Boards in their basin plans, with the exception of the provision on alternate test procedures for individual discharges that have been approved by USEPA Regional Administrator. The alternate test procedures provision was effective on May 22, 2000. The SIP became effective on May 18, 2000, with respect to the priority pollutant criteria promulgated by the USEPA through the CTR. The State Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. The SIP includes procedures for determining the need for and calculating Water Quality-Based Effluent Limitations (WQBELs), and requires Dischargers to submit data sufficient to do so. The State Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for chronic toxicity control. Requirements of this WDR implement the SIP.
4. **Antidegradation Policy**  
Section 131.12 of 40 CFR requires that State water quality standards include an antidegradation policy consistent with the federal policy. The State Board established California's antidegradation policy in State Board Resolution No. 68-16, which incorporates the requirements of the federal antidegradation policy where applicable. Resolution No. 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. As discussed in detail in this Fact Sheet, the permitted discharge shall be consistent with the antidegradation provision of 40 CFR section 131.12 and State Board Resolution No. 68-16.
5. **Anti-Backsliding Requirements**  
Sections 402(o)(2) and 303(d)(4) of the CWA and 40 CFR section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding

provisions require that effluent limitations in a reissued permit must be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed. All effluent limitations in the WDR are at least as stringent as the effluent limitations in the previous Order.

**6. Monitoring and Reporting Requirements**

Section 122.48 of 40 CFR requires that all NPDES permits specify requirements for recording and reporting monitoring results. Sections 13267 and 13383 of the CWC authorize the Regional Boards to require technical and monitoring reports. The MRP establishes monitoring and reporting requirements to implement Federal and State requirements. This MRP is provided in Attachment E.

**D. Impaired Water Bodies on CWA 303(d) List**

The federal Clean Water Act requires States to identify and make a list of surface water bodies that are polluted. These water bodies, referred to in law as "water quality limited segments," do not meet water quality standards even after discharges of wastes from point sources have been treated by the minimum required levels of pollution control technology. Wastewater treatment plants, a city's storm drain system, or a boat yard, are a few examples of point sources that discharge wastes to surface waters. States are required to compile the water bodies into a list, referred to as the "Clean Water Act Section 303(d) List of Water Quality Limited Segments" (303(d) List). States must also prioritize the water bodies on the list and develop action plans, called total maximum daily loads (TMDLs) to improve the water quality.

The State Board updated the 2004-2006 303(d) List for California on October 25, 2006, and EPA approved it on November 30, 2006.

There are approximately 100 impaired water bodies on the 303(d) List in the San Diego Region. Most TMDLs for water bodies within the San Diego Region are under development or have not been started. However, four TMDLs for the San Diego Region need only State Board approval to be complete, and three are already complete. Of the three completed TMDLs, two impact the water quality of San Diego Bay. One TMDL is for Diazonon in Chollas Creek, while the other is for copper in the watershed that drains Shelter Island Basin. These TMDLs did not allocate any waste load for groundwater extraction waste discharge; therefore, the discharge of copper into San Diego Bay via Shelter Island Basin watershed, and the discharge of Diazinon into San Diego Bay via Chollas Creek are prohibited.

**E. Other Plans, Policies and Regulations**

**Ocean Plan**

The State Board adopted the Water Quality Control Plan for Ocean Waters of California (Ocean Plan) in 2005, it was approved by USEPA, and became effective on February 14, 2006. The Ocean Plan identifies the following beneficial uses of state ocean waters to be protected:

- a. Industrial water supply;
- b. Navigation;
- c. Aesthetic enjoyment;
- d. Water contact recreation;
- e. Non-contact water recreation;
- f. Ocean commercial and sport fishing;
- g. Mariculture;
- h. Preservation and enhancement of Areas of Special Biological Significance;
- i. Preservation and enhancement of rare and endangered species;
- j. Marine habitat;
- k. Fish migration;
- l. Fish spawning; and
- m. Shellfish harvesting.

In order to protect the above beneficial uses, the Ocean Plan establishes water quality objectives (for bacteriological, physical, chemical, and biological characteristics, and for radioactivity), general requirements for management of waste discharged to the ocean, quality requirements for waste discharges (effluent quality requirements), discharge prohibitions, and general provisions.

Limits derived from the Ocean Plan have been included in this WDR to protect beneficial uses of San Diego Bay because beneficial uses of San Diego Bay are similar to those of the ocean waters of the State.

### **Toxic Hot Spots**

On June 17, 1999, the State Board adopted the Consolidated Toxic Hot Spot Cleanup Plan (Consolidated Plan) required under Bay Protection and Toxic Cleanup Program (CWC Section 13395). The Consolidated Plan listed known toxic hot spots, including several located in San Diego Bay. The Consolidated Plan also requires Regional Boards to reevaluate waste discharge requirements for those discharges associated with each known toxic hot spot that can reasonably be expected to cause or contribute to the creation and maintenance of the known toxic hot spot. The Regional Board finds that discharges from groundwater extraction waste discharges activities may contribute to the pollution present at the toxic hot spots listed in the Consolidated Plan. In the event that future groundwater extraction waste discharges are proposed to an area of San Diego Bay that is designated as a toxic hot spot, the Regional Board will at that time, review both the Discharge Specifications and the Monitoring and Reporting Programs for appropriate modification(s).

### **III. Rationale For Effluent Limitations and Discharge Specifications**

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. Effluent limitations are based on the following principles:

- A. 40 CFR section 122.44(a) requires that permits include applicable technology-based limitations and standards;
- B. 40 CFR section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water. Where numeric water quality criteria have not been established, three options exist to protect water quality: 1) 40 CFR section 122.44(d) specifies that WQBELs may be established using USEPA criteria guidance under CWA section 304(a); 2) proposed state criteria or a state policy interpreting narrative criteria supplemented with other relevant information may be used; or 3) an indicator parameter may be established;
- C. Any discharge of untreated groundwater to San Diego Bay threatens to cause or contribute to excursions above narrative water quality objectives contained in the Basin Plan as a result of the potential discharge of petroleum related compounds, solvents, and metals. On May 26, 1989, USEPA enacted revisions to NPDES program regulations (40 CFR 122). When a proposed discharge of a compound or chemical threatens to cause or contribute to an excursion above a State narrative water quality standard and a numeric water quality standard for the specific chemical has not been established, the NPDES program regulations require the Regional Board to do the following: 1) Establish effluent limitations using a proposed State water quality objective or standard, or an explicit State policy or regulation interpreting its narrative water quality objective which will protect and maintain water quality and designated beneficial uses of the receiving water; 2) Establish effluent limitations on a case-by-case basis, using USEPA's water quality criteria published under CWA section 307(a); or 3) Establish effluent limitations on an indicator parameter for the pollutants of concern; and
- D. 40 CFR section 122.44(l) requires that when a permit is renewed or reissued, effluent limitations must be at least as stringent as the effluent limitations in the previous permit. Since this permit is a renewal of a previous permit, anti-backsliding is applicable and the following pollutants are included:

|                              |                                      |
|------------------------------|--------------------------------------|
| Settleable Solids            | Copper                               |
| Total Suspended Solids       | Lead                                 |
| Hydrogen Sulfide             | Mercury                              |
| Total Residual Chlorine      | Nickel                               |
| pH                           | Silver                               |
| Benzene                      | Zinc                                 |
| Ethylbenzene                 | Cyanide                              |
| Toluene                      | Phenolic Compounds (non-chlorinated) |
| Xylene                       | Chlorinated Phenolics                |
| Total Petroleum Hydrocarbons | 1,1,2,2-tetrachlorethane (PCA)       |
| Arsenic                      | 1,1,1-trichloroethane (TCA)          |
| Cadmium                      | 1,1,2-trichloroethane (TCA)          |
| Chromium (hexavalent)        |                                      |

|                                   |                       |
|-----------------------------------|-----------------------|
| 1,2-dichloroethane                | Acute Toxicity        |
| Tetrachloroethylene (PCE)         | Chronic Toxicity      |
| Trichloroethylene (TCE)           | Tributyltin (TBT)     |
| Vinyl chloride                    | Total Coliform        |
| Carbon tetrachloride              | Fecal Coliform        |
| Base/Neutral Organic<br>Compounds | Dissolved Oxygen (DO) |

- E. Methyl Tertiary-Butyl Ether (MTBE); is a chemical compound that is manufactured by the chemical reaction of methanol and isobutylene. MTBE is produced in very large quantities (over 200,000 barrels per day in the U.S. in 1999) and is almost exclusively used as a fuel additive in motor gasoline. It is one of a group of chemicals commonly known as "oxygenates" because they raise the oxygen content of gasoline. At room temperature, MTBE is a volatile, flammable and colorless liquid that dissolves rather easily in water.

Because MTBE dissolves easily in water and does not "cling" to soil very well, it migrates faster and farther in the ground than other gasoline components, thus making it more likely to migrate to groundwater extraction wells. MTBE does not degrade (breakdown) easily and is difficult and costly to remove from ground water.

On January 1, 1998, Senate Bill (SB) 521 was passed. SB521 adds language to the Health & Safety Code which is applicable to leaking underground storage tanks as follows: "Section 25299.37.1. No closure letter pursuant to this chapter shall be issued unless the soil or groundwater, or both, where applicable, at the site have been tested for Methyl Tertiary Butyl Ether (MTBE) and the results of that testing are known to the Regional Board." Subsequently, on February 20, 1998, the Regional Board, Site Mitigation & Cleanup Unit, issued written notification to interested parties of Mandatory MTBE Sampling For Underground Storage Tank (UST) Site Closures-Senate Bill (SB) 521. The February 20, 1998, notification specifies that "For ground water impacted sites or soil sites that may threaten ground water, both soil and ground water sampling and analysis for MTBE will be required."

Sections 13272.1 and Section 13285 of the CWC address discharges of MTBE. The California Department of Health Services (DHS) adopted limits for Maximum Contaminant Levels for MTBE. The Primary MCL of 13 µg/L was adopted by DHS on May 17, 2000. The Secondary MCL (for taste and odor not health affects) of 5 µg/L was adopted on January 7, 1999. The UST program uses the more conservative secondary MCL of 5 µg/L.

F. Discharge Prohibitions

Discharges under this WDR are required to be nontoxic. Toxicity is the adverse response of organisms to chemicals or physical agents. This

prohibition is based on the Basin Plans, which require that all waters be maintained free of toxic substances in concentrations that are lethal or produce other detrimental responses in aquatic organisms. Detrimental responses include, but are not limited to, decreased growth rate and decreased reproductive success of resident or indicator species. The Basin Plans also require waters to be free of toxic substances in concentrations that produce detrimental physiological responses in human, plant, or animal life. This objective applies regardless of whether the toxicity is caused by a single substance or the interactive effect of multiple substances.

Mass emission rate limitations will be determined using the discharge flowrate and effluent concentration limitations specified in this WDR; therefore, the daily maximum discharge flowrate limitation for each discharge will be specified in the discharge Notice of Enrollment from the Regional Board. The discharge flowrate will be designated as the maximum discharge flowrate and the Discharger shall be prohibited from discharging in excess of the maximum discharge flowrate.

G. Technology-Based Effluent Limitations (TBELs)

1. Scope and Authority

The CWA requires that TBELs be established based on several levels of controls:

Best Practicable Treatment Control Technology (BPT) represents the average of the best performance by plants within an industrial category or subcategory. The BPT standards apply to toxic, conventional, and nonconventional pollutants.

Best Available Technology Economically Achievable (BAT) represents the best existing performance of treatment technologies that are economically achievable within an industrial point source category. The BAT standards apply to toxic and nonconventional pollutants.

Best Conventional Pollutant Control Technology (BCT) represents the control from existing industrial point sources of conventional pollutants including BOD, TSS, fecal coliform, pH, and oil and grease. The BCT standard is established after considering the "cost reasonableness" of the relationship between the cost of attaining a reduction in effluent discharge and the benefits that would result, and also the cost effectiveness of additional industrial treatment beyond BPT.

New Source Performance Standards (NSPS) represent the best available demonstrated control technology standards. The intent of NSPS guidelines is to set limitations that represent state-of-the-art treatment technology for new sources.

The CWA requires USEPA to develop Effluent Limitations, Guidelines and Standards (ELGs) representing application of BPT, BAT, BCT, and NSPS. Section 402(a)(1) of the CWA and 40 CFR section 125.3 of the NPDES regulations authorize the use of Best Professional Judgment (BPJ) to derive technology-based effluent limitations on a case-by-case basis where ELGs are not available for certain industrial categories and/or pollutants of concern. Where BPJ is used, the permit writer must consider specific factors outlined in 40 CFR section 125.3.

## 2. Applicable Technology-Based Effluent Limitations

The USEPA has not developed numeric Technology-Based effluent limitations for pollutants in discharges from groundwater extraction.

## H. Water Quality-Based Effluent Limitations (WQBELs)

### 1. Scope and Authority

As specified in 40 CFR section 122.44(d)(1)(i), permits are required to include WQBELs for pollutants (including toxicity) that are or may be discharged at levels that cause, have reasonable potential to cause, or contribute to an excursion above any state water quality standard. The process for determining reasonable potential and calculating WQBELs when necessary is intended to protect the designated uses of the receiving water as specified in the Basin Plan, achieve applicable water quality objectives and criteria contained in state plans and policies, and meet water quality criteria in the CTR and NTR.

### 2. Applicable Beneficial Uses and Water Quality Criteria and Objectives

The designated beneficial uses of surface waters throughout the State may include municipal, domestic, industrial, and agricultural supply; water contact and non-contact recreation; navigation; groundwater recharge and freshwater replenishment; hydropower generation; wildlife habitat; cold freshwater and warm freshwater habitat; fish migration and fish spawning; marine habitat; estuarine habitat; shellfish harvesting; ocean commercial and sport fishing; areas of special biological significance; and preservation of rare and endangered species. To the extent that the Basin Plan designates additional or different beneficial uses, the Basin Plan shall control.

### 3. Determining the Need for WQBELs

All applicable provisions of sections 301 and 402 of the CWA must be met for NPDES permits for discharges to surface waters. These provisions require controls of pollutant discharges that utilize BAT and BCT to reduce pollutant and any more stringent controls necessary to meet water quality standards.

As specified in the SIP, the Regional Board shall conduct an analysis for each priority pollutant with applicable criterion or objective to determine if a water quality-based effluent limitation is required.

Data are unavailable to conduct an analysis because this WDR as a general permit does not have a Report of Waste Discharge. Therefore, the discharger shall conduct an initial sample based on flow to determine the requirements.

The previous WDR Order No. 2000-90 did not differentiate discharges based on flows; however, WDR Order 2001-96 (*General Waste Discharge Requirements and National Pollutant Discharge Elimination System (NPDES) Permit for Groundwater Extraction Waste Discharges from Construction, Remediation, And Permanent Groundwater Extraction Projects To Surface Waters Within The San Diego Region except for San Diego Bay*) does differentiate discharges based on flows. The WDR 2001-96 does not require effluent limits for discharges less than 100,000 gallons per day that do not contain pollutants because lack of complaints of adverse impacts to water quality and/or beneficial uses of the receiving waters, and lack of documentation of adverse impacts to water quality and/or beneficial uses of the receiving waters.

Based on WDR Order No. 2001-96 the same could be assumed for discharges for San Diego Bay. However, to be environmentally conservative only half of the discharge will be assumed. Instead of differentiating the discharge by 100,000 gallons per day, this WDR will differentiate the flow by 50,000 gallons per day.

#### Reasonable Potential Analysis

In order to determine what to sample and frequency an initial set of data is needed.

If the discharger proposes to discharge less than 50,000 gallons per day, then the discharger shall initially conduct Annual Monitoring Program A (sample for the entire constituents listed in III.D. and MTBE for a total of 38 constituents).

However, if the discharger proposes to discharge 50,000 gallons per day or more, then the discharger shall initially conduct Annual Monitoring Program B (sample the entire constituents listed in III.D., MTBE, and all 126 priority pollutants).

Based on the initial monitoring program if the discharge will require no treatment to meet the discharge specifications of this WDR, then the discharger will conduct Annual Monitoring Program A (if discharging less than 50,000 gallons per day) or Annual Monitoring Program B (if

discharging 50,000 gallons per day or more) once per year. This will provide data to identify reasonable potential for future effluent limits.

If the discharge will require treatment prior to discharge, then in addition to the Annual Monitoring Program listed above, the discharger will also monitor for all the constituents listed in the discharge specification with effluent limits at the frequency required in the Monitoring and Reporting Program stated in Attachment E because of the reasonable potential of exceeding the effluent limits in the discharge specifications of this WDR.

If there are any contaminated sites within the radius of influence of the groundwater extraction activities, then the constituent of concern will be monitored at the frequency required in the Monitoring and Reporting Program stated in Attachment E because of the reasonable potential of exceeding the effluent limits in the discharge specifications of this WDR. If the constituent of concern is not listed in the Monitoring and Reporting Program stated in Attachment E then a monitoring and reporting frequency will be stated in the Notice of Enrollment.

Table summarizing effluent limits and monitoring

| Category 1        |   |   |
|-------------------|---|---|
| Threat Level      | High Threat                               |   |
| CONDITION         |   |   |
| Flow              | Low Flow                                  | High Flow                                 |
| Treatment         | Treatment Required                        | Treatment Required                        |
| Contaminated site |   |   |
| MONITORING        |   |   |
| Annual            | Annual Monitoring<br>38 Constituents      | Annual Monitoring<br>~160 Constituents    |
| Regular           | Regular monitoring<br>for 38 constituents | Regular monitoring for 38<br>constituents |

| Category 2        |  |  |
|-------------------|--|--|
| Threat Level      | Moderate Threat  |  |
| CONDITION         |  |  |
| Flow              | Low Flow   | High Flow  |
| Treatment         | No Treatment   | No Treatment   |
| Contaminated site | Pumping within zone of radius of contaminated site                 | Pumping within zone of radius of contaminated site                 |
| MONITORING        |  |  |

| Regular           | None                                 | None                                   |

#### 4. WQBEL Calculations

The Average Monthly Effluent and Maximum Daily Effluent WQBELs were calculated using a statistical approach with the following considerations and assumptions:

No dilution credit is considered for the discharge. Therefore, the discharge must comply with the Water Quality Objective at the point of discharge.

The WQBEL based on the CTR were implemented using the procedure list in the SIP. The procedure is listed below with copper as the example.

CTR/SIP calculations - Copper Example:

Criteria for Priority Toxic Pollutant in the State of California is described in the CTR table listed in 40 CFR 131.38.

§ 131.38

Saltwater criterion maximum concentration (CMC) = 4.8 µg/L

Saltwater criterion continuous concentration (CCC) = 3.1 µg/L

The SIP requires that discharge effluent limitations be specified as total recoverable concentrations and converted to dissolved concentration for determining compliance with water quality criteria. Effluent limitations as a total recoverable concentration are also required by 40 CFR 122.45(c). The WDR includes effluent limitations as a total recoverable concentration for the discharge.

The SIP specifies use of a conversion factor to adjust a criterion expressed as a dissolved form to a total recoverable form. The CTR specifies the use of a conversion factor (CF). The dissolved criterion is divided by the CF to calculate the total recoverable concentration.

The CF for saltwater acute criteria recommended for converting a metal criterion expressed as the total recoverable fraction in the water column to a criterion expressed

as the dissolved fraction in the water column is described in Table 2 of 40 CFR 131.38.

§ 131.38

40 CFR Ch. I (7-1-00 Edition)

(iv) Table 2 to paragraph (b)(2) of this section:

| Metal                | Conversion factor (CF) for freshwater acute criteria | CF for freshwater chronic criteria | CF for saltwater acute criteria | CF for saltwater chronic criteria |
|----------------------|--|------------------------------------|---------------------------------|-----------------------------------|
| Antimony .....       | ( <sup>d</sup> )                                     | ( <sup>d</sup> )                   | ( <sup>d</sup> )                | ( <sup>d</sup> )                  |
| Arsenic .....        | 1.000  | 1.000                              | 1.000                           | 1.000                             |
| Beryllium .....      | ( <sup>d</sup> )                                     | ( <sup>d</sup> )                   | ( <sup>d</sup> )                | ( <sup>d</sup> )                  |
| Cadmium .....        | 0.944  | 0.909                              | 0.994                           | 0.994                             |
| Chromium (III) ..... | 0.316  | 0.860                              | ( <sup>d</sup> )                | ( <sup>d</sup> )                  |
| Chromium (VI) .....  | 0.982  | 0.962                              | 0.993                           | 0.993                             |
| Copper .....         | 0.960  | 0.960                              | 0.83                            | 0.83                              |

CF for copper = 0.83

Total recoverable concentration = Dissolved concentration criterion / CF

Dissolved concentrations for copper:

4.8 µg/L dissolved (CMC) / 0.83 (CF) = 5.8 µg/L total recoverable for CMC

3.1 µg/L dissolved (CCC) / 0.83 (CF) = 3.7 µg/L total recoverable for CCC

Effluent variability multiplier and Coefficient of Variation (CV)

For each concentration based on an aquatic life criterion, the long-term average (LTA) is calculated by multiplying the concentration with a factor that adjusts for effluent variability. The multiplier can be found in Table 1 of the SIP. Since this is a WDR without existing data points, the number of effluent data points is less than ten; the CV shall be set equal to 0.6 per the SIP.

Table 1. Effluent Concentration Allowance (ECA)  
Multipliers for Calculating Long-Term Averages (LTAs)

| Coefficient Of Variation (CV) | Acute Multiplier                                   | Chronic Multiplier                                 |
|-------------------------------|--|--|
|                               | 99 <sup>th</sup> Percentile Occurrence Probability | 99 <sup>th</sup> Percentile Occurrence Probability |
| 0.1                           | 0.797  | 0.891  |
| 0.2                           | 0.643  | 0.797  |
| 0.3                           | 0.527  | 0.715  |
| 0.4                           | 0.440  | 0.643  |
| 0.5                           | 0.373  | 0.581  |
| 0.6                           | 0.321  | 0.527  |

Therefore, from Table 1 of the SIP, the effluent variability multiplier will be as follows:

Acute Multiplier = 0.321

Chronic Multiplier = 0.527

The long-term average (LTA) is calculated by multiplying the dissolved concentrations for copper with the acute and chronic multipliers:

LTA acute =  $5.8 \mu\text{g/L} * 0.321 = 1.9 \mu\text{g/L}$

LTA chronic =  $3.7 \mu\text{g/L} * 0.527 = 2.0 \mu\text{g/L}$

The MDEL and AMEL will be based on the most limiting of the acute and chronic LTA, in the case for copper it will be LTA acute of  $1.9 \mu\text{g/L}$ .

Water quality-based effluent limits are calculated by multiplying the most limiting LTA with a factor (multiplier) that adjusts for the averaging periods and exceedance frequencies of the criteria and the effluent limitations. The multiplier can be found in Table 2 of the SIP. Since this is a WDR without existing data points, the CV will be set equal to 0.6 and since sampling frequency is four times a month or less, n shall be set equal to 4 per SIP (n=4).

Table 2. Long-Term Average (LTA) Multipliers for Calculating Effluent Limitations

| Coefficient of Variation | MDEL Multiplier                                    | AMEL Multiplier                                    |       |        | MDEL/AMEL Multiplier  |       |        |
|--------------------------|--|--|-------|--------|---|-------|--------|
|                          | 99 <sup>th</sup> Percentile Occurrence Probability | 95 <sup>th</sup> Percentile Occurrence Probability |       |        | MDEL = 99 <sup>th</sup> Percentile<br>AMEL = 95 <sup>th</sup> Percentile Occurrence Probability |       |        |
| (CV)                     |  | n = 4  | n = 8 | n = 30 | n = 4   | n = 8 | n = 30 |
| 0.1                      | 1.25   | 1.08   | 1.06  | 1.03   | 1.16  | 1.18  | 1.22   |
| 0.2                      | 1.55   | 1.17   | 1.12  | 1.06   | 1.33  | 1.39  | 1.46   |
| 0.3                      | 1.90   | 1.26   | 1.18  | 1.09   | 1.50  | 1.60  | 1.74   |
| 0.4                      | 2.27   | 1.36   | 1.25  | 1.12   | 1.67  | 1.82  | 2.02   |
| 0.5                      | 2.68   | 1.45   | 1.31  | 1.16   | 1.84  | 2.04  | 2.32   |
| 0.6                      | 3.11   | 1.55   | 1.38  | 1.19   | 2.01  | 2.25  | 2.62   |

Therefore, from Table 2 of the SIP, the LTA multipliers will be as follows:

MDEL Multiplier = 3.11

AMEL Multiplier = 1.55

The MDEL and AMEL limits are calculated by multiplying the LTA with an LTA multiplier for each limit:

Maximum Daily Effluent Limit (MDEL) =  $1.9 \mu\text{g/L} * 3.11 = 5.8 \mu\text{g/L}$

Average Monthly Effluent Limit (AMEL) =  $1.9 \mu\text{g/L} * 1.55 = 2.9 \mu\text{g/L}$

# I. Whole Effluent Toxicity (WET)

Whole effluent toxicity (WET) tests measure the aggregate toxic effect of a mixture of pollutants that may be present in a waste stream and provides information on potential toxic impacts to receiving waters from the discharge of wastes. WET tests measure the degree of response of exposed aquatic test organisms to an effluent. The WET approach provides a means of assessing compliance with the narrative toxicity water quality objective for aquatic life protection of the Basin Plan while implementing numeric criteria for toxicity. There are two types of WET tests: acute and chronic. An acute toxicity test is conducted over a short time period and measures mortality. A chronic toxicity test is conducted over a longer period of time and may measure mortality, reproduction, and development.

The SIP requires that a Toxicity Reduction Evaluation (TRE) be conducted if a discharge causes or contributes to chronic toxicity in a receiving water body. This WDR requires the Discharger to periodically monitor the toxicity of its discharge and to develop a TRE Workplan if the toxicity effluent limitations are exceeded.

# J. Anti-Backsliding Effluent Limitations

Sections 402(o)(2) and 303(d)(4) of the CWA and 40 CFR section 122.44(l) prohibit backsliding in NPDES permits. The following limits designated with AB in the Final Effluent Limitations table below have the same limit as the previous permit.

# K. Final Effluent Limitations

## Summary of Water Quality-Based Effluent Limitations

### Discharge Point

### Summary of Water Quality-based Effluent Limitations Table

#### General / Inorganic / Biological

| Parameter               | Units | Effluent Limitations |                   |                    |                       |                 |

<sup>DHS</sup> Basis – Department of Health Services

<sup>CTR</sup> Basis – California Toxics Rule/ State Implementation Plan 2005

\* Copper discharge from the Shelter Island Basin watershed to San Diego Bay is prohibited.

Mass Limits

All permit limitations, standards or prohibitions shall be expressed in terms of mass except for pH, or other pollutants which cannot appropriately be

expressed by mass or under certain circumstances including "when applicable standards and limitations are expressed in terms of other units of measurement." (40 CFR § 122.45(f)(1)). Therefore, all concentration limits stated above except for Settleable Solids, Acute Toxicity, Chronic Toxicity, Total Coliform, Fecal Coliform, pH, and Dissolved Oxygen shall also have a mass limit based on its concentration limit times the discharge flow limit in the Notice of Enrollment expressed in pounds per day (lbs/d) as shown in the equations below:

$$\begin{aligned} \text{Concentration Limit} * \text{Flow Limit} * \text{Conversion Factor} &= \text{Mass Limit} \\ (\text{mg/l}) * (\text{MGD}) * 8.34 (\text{lb} * \text{L} / (\text{Million Gallons} * \text{mg})) &= \text{lbs/day} \\ (\mu\text{g/l}) * (\text{MGD}) * 0.00834 (\text{lb} * \text{L} / (\text{Million Gallons} * \mu\text{g})) &= \text{lbs/day} \\ (\text{mg/l}) * (\text{gpd}) * 0.00000834 (\text{lb} * \text{L} / (\text{Gallons} * \text{mg})) &= \text{lbs/day} \\ (\mu\text{g/l}) * (\text{gpd}) * 0.0000000834 (\text{lb} * \text{L} / (\text{Million Gallons} * \mu\text{g})) &= \text{lbs/day} \end{aligned}$$

- L. Interim Effluent Limitations (Not Applicable)
- M. Land Discharge Specifications (Not Applicable)
- N. Reclamation Specifications (Not Applicable)

#### IV. Rationale for Receiving Water Limitations

##### A. Surface Water

Receiving Water Limitations are based upon water quality objectives contained in the Basin Plan. The discharge of groundwater extraction waste from any site shall not, separately or jointly with any other discharge, cause violations of the following water quality objectives in San Diego Bay.

##### 1. Bacterial Characteristics

##### a. Water-Contact Standards

Within a zone bounded by the shoreline and a distance of 1,000 feet from the shoreline or the 30-foot depth contour, whichever is further from the shoreline, and in areas outside this zone used for water-contact sports, as determined by the Regional Board, the following bacterial objectives shall be maintained throughout the water column:

- (1) Samples of water from each sampling station shall have a density of total coliform organisms less than 1,000 per 100 ml (10 per ml); provided that not more than 20 percent of the samples at any sampling station, in any 30-day period, may exceed 1,000 per 100 ml (10 per ml), and provided further that no single sample when verified by a repeat sample taken within 48 hours shall exceed 10,000 per 100 ml (100 per ml).
- (2) The fecal coliform density based on a minimum of not less than five samples for any 30-day period shall not exceed a

geometric mean of 200 per 100 ml nor shall more than 10 percent of the total samples during any 60-day period exceed 400 per 100 ml.

b. Shellfish Harvesting Standards

At all areas where shellfish may be harvested for human consumption, as determined by the Regional Board, the following bacterial objectives shall be maintained throughout the water column:

- 1) The median total coliform density shall not exceed 70 per 100 ml; and
- 2) Not more than 10 percent of the samples shall exceed 230 per 100 ml.

2. Physical Characteristics

- a. Floating particulates and grease and oil shall not be visible.
- b. The discharge of waste shall not cause aesthetically undesirable discoloration of the surface of San Diego Bay.
- c. Natural light shall not be significantly reduced.
- d. The rate of deposition of solids and the characteristics of inert solids in San Diego Bay sediments shall not be changed such that benthic communities are degraded.

3. Chemical Characteristics

- a. The dissolved oxygen concentration shall not at any time be depressed more than 10 percent from that which occurs naturally, as a result of the discharge of oxygen demanding waste materials.
- b. The pH shall not be changed at any time more than 0.2 units from that which occurs naturally.
- c. The dissolved sulfide concentration of waters in and near sediments shall not be significantly increased above that present under natural conditions.
- d. The concentration of substances set forth in the Discharge Specifications in marine sediments shall not be increased to levels which would degrade indigenous biota.
- e. The concentration of organic materials in San Diego Bay sediments shall not be increased to levels which would degrade marine life.
- f. Nutrient materials shall not cause objectionable aquatic growth or degrade indigenous biota.

4. Biological Characteristics

- a. Marine communities, including vertebrate, invertebrate, and plant species, shall not be degraded.
- b. The natural taste, odor, and color of fish, shellfish, or other aquatic resources used for human consumption shall not be altered.

- c. The concentration of organic materials in fish, shellfish or other aquatic resources used for human consumption shall not bioaccumulate to levels that are harmful to human health.

5. Radioactivity

Discharge of radioactive waste shall not degrade marine life.

6. Toxic Materials Limitations

Since there is no dilution, toxic materials limits are the same as the effluent limits.

## V. Rationale for Monitoring and Reporting Requirements

Section 122.48 of 40 CFR requires all NPDES permits to specify recording and reporting of monitoring results. Sections 13267 and 13383 of the CWC authorize the Regional Board to require technical and monitoring reports. The MRP, Attachment E of this WDR, establishes monitoring and reporting requirements to implement federal and state requirements. The following provides the rationale for the monitoring and reporting requirements contained in the MRP for this permit.

A. Influent Monitoring (Not applicable)

B. Effluent Monitoring

In reviewing the monitoring reports, the State Board found that although Dischargers were reporting Total Petroleum Hydrocarbons (TPH), a distinction between diesel and gasoline was not always made. Results for TPH should be reported as total TPH, TPH diesel (TPH-d), and TPH gasoline (TPH-g). Also, for detections of TPH-g, the amount of benzene, ethylbenzene, toluene, and xylene should be reported. Benzene, ethylbenzene, and toluene are priority pollutants. (40 CFR § 131).

C. Whole Effluent Toxicity (WET) Testing Requirements

A WET Limit is required if a discharge causes, has a reasonable potential to cause, or contributes to an exceedance of applicable water quality standards, including numeric and narrative. Since these types of discharges are prohibited under this WDR, WET limits are not applicable.

D. Receiving Water Monitoring

States are required to adopt numeric criteria where they are necessary to protect designated uses. (CWA §§ 303(a) – 303(c)). The Regional Board adopted numeric criteria in the Basin Plan. The Basin Plan is a regulatory reference for meeting the State and Federal requirements for water quality control. (40 CFR 131.20). State Board Resolution 68-16, the Antidegradation Policy, does not allow changes in water quality less than that prescribed in Water Quality Control

Plans (Basin Plans). The Basin Plan states that; "The numerical and narrative water quality objectives define the least stringent standards that the Regional Water Board will apply to regional waters in order to protect the beneficial uses." This WDR contains Receiving Water Limitations based on the Basin Plan numerical and narrative water quality objectives for Biostimulatory Substances, Chemical Constituents, Color, Dissolved Oxygen, Floating Material, Oil and Grease, pH, Pesticides, Radioactivity, Salinity, Sediment, Settleable Material, Suspended Material, Tastes and Odors, Temperature, Toxicity and Turbidity.

Section 13267 of the California Water Code states, in part,

(a) A regional board, in establishing ... waste discharge requirements ... may investigate the quality of any waters of the state within its region" and "(b) (1) In conducting an investigation ... the regional board may require that any person who ... discharges ... waste ... that could affect the quality of waters within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the regional board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports.

The attached Monitoring and Reporting Program is issued pursuant to CWC section 13267. The groundwater monitoring and reporting program required by this WDR and the attached Monitoring and Reporting Program are necessary to determine compliance with these waste discharge requirements. The Discharger is responsible for the discharges of waste at the facility subject to this WDR.

E. Other Monitoring Requirements (Not Applicable)

## **VI. Rationale for Provisions**

A. Standard Provisions

Standard Provisions, which in accordance with 40 CFR sections 122.41 and 122.42, apply to all NPDES discharges and must be included in every NPDES permit, are provided in Attachment D.

B. Special Provisions

1. Reopener Provisions (Not Applicable)
2. Special Studies and Additional Monitoring Requirements (Not Applicable)
3. Best Management Practices and Pollution Prevention Plan (Not Applicable)
4. Compliance Schedules (Not Applicable)
5. Construction, Operation, and Maintenance Specifications (Not Applicable)

6. Special Provisions for Municipal Facilities (POTWs Only) (Not Applicable)

7. Other Special Provisions

The Dischargers shall dispose of solids removed from liquid wastes in a manner that is consistent with Title 27 of the CCR and approved by the Regional Board.

VII. Public Participation

In considering the re-issuance and adoption of this WDR the Regional Board has developed a draft WDR. The Regional Board encouraged public participation in the WDR adoption process.

A. Notification of Interested Parties

The Regional Board notified interested agencies and persons of its intent to prescribe waste discharge requirements in this WDR and provided them with an opportunity to submit their written comments and recommendations. On September 21, 2007, the Regional Board sent out notification through the Regional Board Agenda by an electronic mail list and by U.S. Postal Service. Notification was posted on the Regional Board's webpage on September 7, 2007, and published in the San Diego Union Tribune newspaper on September 5, 2007.

B. Written Comments

Interested persons were invited to submit written comments concerning the tentative WDR. Comments were to be submitted in person, by fax, email, or mail to the Executive Officer at the Regional Board at the address on the cover page of this Permit.

To be fully addressed and considered by the Regional Board, written comments should be submitted at the Regional Board office by 5 p.m. on October 3, 2007.

C. Public Hearing

The Regional Board held a public hearing on the tentative WDR during its regular meeting on the following date and at the following location:

Date: **October 10, 2007**  
Location: **Water Quality Control Board  
Regional Board Meeting Room  
9174 Sky Park Court  
San Diego, California**

Interested persons were invited to attend. At the public hearing, the Regional Board heard testimony pertinent to the discharge and WDR.

D. Information and Copying

WDR-related documents, tentative effluent limitations and special provisions, comments received, and other information are on file and may be inspected at the address above at any time between 8:30 a.m. and 4:45 p.m., Monday through Friday. A partial list of these items are on the Regional Board's web site at: [www.waterboards.ca.gov/sandiego](http://www.waterboards.ca.gov/sandiego)

Copying of documents may be arranged through the Regional Board by calling (858) 467-2952.

E. Register of Interested Persons

Any person interested in being placed on the mailing list for information regarding the WDR was invited to contact the Regional Board, reference this WDR, and provide a name, address, and telephone number.

F. Additional Information

Requests for additional information or questions regarding this WDR may be directed to Vicente Rodriguez at (858) 627-3940 or at: [VRodriguez@waterboards.ca.gov](mailto:VRodriguez@waterboards.ca.gov)

This WDR will expire on October 10, 2012. Enrollees covered under this WDR at the time of expiration will be required to re-enroll under the reissued permit.

### GENERAL WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES FROM GROUNDWATER EXTRACTION AND SIMILAR DISCHARGES TO SURFACE WATERS WITHIN THE SAN DIEGO REGION EXCEPT FOR SAN DIEGO BAY (WDR)

**ORDER NO. R9-2008-0002**  
**NPDES NO. CAG919002**

A Discharger, as described in the following table that has complied with the requirements for coverage under this General "Waste Discharge Requirements" (WDR), is subject to waste discharge requirements, once permit coverage is effective, as set forth in this WDR.

|             |   |
|-------------|---|
| Dischargers | Any person with discharges from ground water extraction activities to surface waters within the San Diego Region, except for San Diego Bay that do not cause, have the reasonable potential to cause, or contribute to an instream excursion above any applicable State or federal water quality objectives/criteria or cause acute or chronic toxicity in the receiving water. |
|-------------|---|

|  |                |
|--|----------------|
| This WDR was adopted by the Regional Board on:   | March 12, 2008 |
| This WDR shall become effective on:  | March 12, 2008 |
| This WDR shall expire on:  | March 12, 2013 |
| The U.S. Environmental Protection Agency and the California Regional Water Quality Control Board, San Diego Region have classified these discharges as minor discharges. |                |

IT IS HEREBY ORDERED that Order No. 2001-96 is rescinded upon the effective date of this WDR except for enforcement purposes, as specified elsewhere in this Order, and; in order to meet the provisions contained in Division 7 of the California Water Code and regulations adopted therein, and the provisions of the federal Clean Water Act, and regulations and guidelines adopted therein, Dischargers shall comply with the requirements in this WDR.

I, John H. Robertus, Executive Officer, do hereby certify the following is a full, true, and correct copy of an Order adopted by the California Regional Water Quality Control Board, San Diego Region on March 12, 2008.

for John H. Robertus, Executive Officer

**California Environmental Protection Agency**

## **I. DISCHARGE INFORMATION**

### **A. Groundwater Extraction**

Existing and proposed discharges of groundwater extraction waste to surface waters within the San Diego Region from construction groundwater extraction, foundation groundwater extraction and groundwater extraction related to groundwater remediation cleanup projects (collectively groundwater extraction):

1. Result from similar operations (all involve extraction and discharge of groundwater);
2. Are the same type of wastes (all are groundwater containing or potentially containing petroleum hydrocarbons, solvents, or other pollutants);
3. Require similar effluent limitations for the protection of the beneficial uses of similar receiving waters;
4. Require similar monitoring; and
5. Are more appropriately regulated under a general permit rather than individual permits.

## **II. PERMIT INFORMATION**

### **A. Application**

To obtain coverage under this WDR a Discharger must submit the following to the California Regional Water Quality Control Board, San Diego Region (Regional Board):

1. A Notice of Intent (NOI), including the following information:
  - a. Owner and Operator name;
  - b. Owner and Operator address;
  - c. Owner and Operator telephone number;
  - d. Site name
  - e. Site address
  - f. Type of discharges;
  - g. Name of receiving waterbody and conveyance(s);
2. An initial sampling and monitoring report;
3. A project map(s) that shows the essential features of the groundwater extraction system within the Regional Board boundary, and the corresponding surface water or storm drain to which water will be discharged; and
4. Payment of the application fee, equal to the first annual fee, made payable to "SWRCB."

The NOI form is included within this WDR package as Attachment B.

The WDR NOI, including, map(s), the application fee, and other attachments, must be submitted to the following address:

CRWQCB – San Diego Region  
9174 Sky Park Court, Suite 100  
San Diego, CA 92123

Attn: Groundwater Extraction to San Diego Region  
Core Regulatory Unit  
NOTICE OF INTENT

**B. Coverage**

Permit coverage will be effective when all of the following have occurred:

1. The Discharger has submitted a complete NOI application (including initial sampling and monitoring report), as determined by the Regional Board; and
2. The Regional Board issues the Discharger's a Notice of Enrollment, which includes the discharge flow limit, any additional or increase in monitoring due to specific circumstances of the discharge, and any other additional requirements.
3. Current dischargers enrolled in Order No. 2001-96 shall re-enroll no later than 365 days after adoption of this WDR, each discharger currently enrolled in Order No. 2001-96 shall continue to comply with Order No. 2001-96 until obtaining permit coverage under this WDR.

**C. Eligibility Criteria**

This WDR is intended to cover all discharges of groundwater extraction wastes to surface waters within the San Diego Region Except San Diego Bay, from groundwater extraction due to construction and other groundwater extraction activities regardless of volume, including discharges less than 100,000 gallons per day. Dischargers must meet the following criteria to be subject to waste discharge requirements by this WDR:

1. The discharge of extracted groundwater due to groundwater extraction activities is discharged to surface waters within San Diego Region except San Diego Bay;
2. Pollutant concentrations in the discharge comply with the Discharge Specifications of this WDR.

This WDR does not cover:

**STORM WATER** - Storm water runoff due to construction activities. These activities may be covered under the statewide general NPDES permit for storm water discharges associated with construction activities (CAS000002), the statewide general NPDES permit for storm water runoff associated with small linear underground/overhead construction projects (CAS000005), and/or Clean Water Act (CWA) Section 401 Water Quality Certifications.

**SANITARY SEWER** - Discharges to a sanitary sewer. These discharges do not need coverage under the NPDES Program. Contact the agency controlling the sanitary sewer for approval prior to discharging to its conveyance system.

**UTILITY VAULTS** - Discharges from utility vaults and underground structures. These activities may be covered under the statewide general NPDES permit for discharges from utility vaults and underground structures to surface water Order No. 2006-0008-DWQ (CAG990002).

**HYDROSTATIC/ POTABLE WATER** – Discharges from drinking water well development. These discharges are covered under Order No. R9-2002-0020 (CAG679001).

**D. Discharge to a Municipal Separate Storm Sewer System (MS4)**

Prior to discharging into an MS4, the Discharger shall demonstrate alternatives to discharging extracted groundwater waste into an MS4 and why it is technically or economically infeasible to implement these alternatives.

Without prior approval from the appropriate local agency with jurisdiction over the MS4, the discharger shall not discharge extracted groundwater waste under this WDR into an MS4.

Local agencies responsible for operating the MS4s may not passively receive and discharge pollutants from third parties. By providing free and open access to an MS4 that conveys discharges to waters of the U.S., the MS4 operator essentially accepts responsibility for discharges into the MS4 that it does not prohibit or control. These discharges may cause or contribute to a condition of contamination or a violation of water quality standards.

Therefore, at least 30 days prior to initiating an extracted groundwater discharge to an MS4, the Discharger shall notify and receive authorization from the appropriate local agency with jurisdiction over the MS4. This requirement encourages communication between Dischargers enrolled under this WDR and local agencies responsible for MS4s in an effort to reduce misunderstandings and concerns over the types of discharges covered by this WDR.

**E. Termination of Discharges**

Dischargers shall submit a written request referred to as a "Notice of Termination (NOT)" to this Regional Board when coverage under this WDR is no longer required. The NOT letter constitutes a notice that the owner (and his/her agent) of the site has ceased the discharge of ground water associated with the groundwater extraction activities at the site under this WDR.

The NOT should include "Notice of Termination (NOT)" in the subject line, the Waste Discharge Identification Number (WDID) assigned to the project by the Regional Board when enrolled in the WDR, the name and address of the owner, and be signed and dated by the owner in accordance with the signatory requirements of the WDR. The Discharger shall continue to comply with the

requirements of the WDR until the Regional Board approves the NOT. Submittal of a NOT letter does not guarantee termination. Approval of the NOT does not relieve the Discharger's responsibility for paying any applicable outstanding invoices of annual fees as a result of enrollment under this WDR, nor does it relieve the Discharger from enforcement from existing violations.

**F. Re-Enrollment of Renewed Permit**

Dischargers enrolled under previous General Permit Order No. 2001-96 that plan on continuing their discharge, must re-enroll by submitting an NOI to obtain coverage under this WDR. Re-enrollees shall re-enroll no later than 365 days after the date of adoption of this WDR to achieve compliance with the new effluent limitations and criteria established by this WDR.

**G. Transferring Ownership**

Enrollment under the WDR for a specific project is not transferable. In the event of any change in ownership of land or waste discharge facilities presently owned by the enrolled Discharger, the Discharger must notify the new succeeding owner of the existence of this WDR by letter 120 days prior to property transfer, a copy of which must be immediately forwarded to the Regional Board office. Additionally, the Discharger must submit a NOT to the Regional Board. The new succeeding owner must submit a new NOI in application of enrollment under this WDR.

**III. Findings**

The Regional Board finds:

**A. Background**

This WDR supersedes Order No. 2001-96. The NPDES No. CAG919002 remains the same. Dischargers enrolled under previous Order No. 2001-96 must obtain coverage under this new WDR to continue their discharge subject to waste discharge requirements in this WDR.

**B. Discharge Subject to Waste Discharge Requirements**

To be subject to waste discharge requirements in this WDR for continued and future discharge to waters of the United States, Dischargers must submit an NOI and obtain coverage in order to be regulated under this WDR as provided in 40 CFR section 122.28 (b)(2).

**C. Discharge Description**

Existing and proposed discharges of groundwater extraction waste to surface waters within the San Diego Region except San Diego Bay from construction groundwater extraction, foundation groundwater extraction and groundwater extraction related to groundwater remediation (collectively referred to as Groundwater Extraction).

#### **D. Legal Authorities**

These waste discharge requirements are issued pursuant to Sections 13263 and 13377 of the California Water Code (CWC). The Regional Board shall prescribe requirements as to the nature of any proposed discharge and shall issue waste discharge requirements which apply and ensure compliance with all applicable provisions of the Federal Water Pollution Control Act, also referred as the Clean Water Act (CWA).

These waste discharge requirements issued by the Regional Board shall also serve as an NPDES permit for point source discharges from groundwater extraction waste to surface waters within the San Diego Region except San Diego Bay.

States may request authority to issue general NPDES permits pursuant to 40 CFR section 122.28. On June 8, 1989, the California State Water Resources Control Board (State Board) submitted an application to USEPA requesting revisions to its NPDES Program in accordance with 40 CFR sections 122.28, 123.62, and 403.10. The application included a request to add general permit authority to its approved NPDES Program. On September 22, 1989, USEPA, Region 9, approved the State Board's request and granted authorization for the State of California to issue general NPDES permits.

#### **E. Background and Rationale for Requirements**

The Regional Board developed the requirements in this WDR based on information submitted as part of the applications for several like agencies, individuals, and entities, through monitoring and reporting programs, and through special studies. Attachments A through F, which contain background information and rationale for WDR requirements, are hereby incorporated into this WDR and constitute part of the Findings for this WDR.

#### **F. California Environmental Quality Act (CEQA)**

This action to adopt a NPDES permit is exempt from the provisions of CEQA (Public Resources Code section 21100, et seq.) in accordance with CWC section 13389.

#### **G. Technology-Based Effluent Limitations (TBELs)**

Permits shall include applicable TBELs and standards. (40 CFR § 122.44(a)). This WDR does not include numeric-TBELs because USEPA has not promulgated effluent limitation guidelines for groundwater extraction.

#### **H. Water Quality-Based Effluent Limitations (WQBELs)**

Permits shall include WQBELs to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water. (40 CFR § 122.44(d)). Where numeric water quality criteria have not been established, WQBELs may be established using USEPA CWA section 304(a) criteria guidance, proposed State criteria or a State policy interpreting

narrative criteria supplemented with other relevant information, or an indicator parameter. (40 CFR § 122.44(d)).

**I. Water Quality Control Plan**

The Regional Board's Water Quality Control Plan for the San Diego Basin (hereinafter Basin Plan) designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the Basin Plan. The Basin Plan was adopted by the Regional Board on September 8, 1994, and was subsequently approved by the State Board on December 13, 1994. Subsequent revisions to the Basin Plan have also been adopted by the Regional Board and the State Board.

In addition, State Board Resolution No. 88-63 establishes state policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal and domestic supplies. Requirements of this WDR specifically implement the applicable provisions of the Basin Plan and State Board policy.

**J. National Toxics Rule (NTR) and California Toxics Rule (CTR)**

The USEPA adopted the NTR on December 22, 1992, which was amended on May 4, 1995, and November 9, 1999. The CTR was adopted by USEPA on May 18, 2000, and amended on February 13, 2001. These rules include water quality criteria for priority pollutants and are applicable to these discharges.

**K. State Implementation Policy**

On March 2, 2000, the State Board adopted the Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (State Implementation Policy or SIP). The SIP became effective on April 28, 2000, with respect to the priority pollutant criteria promulgated for California by USEPA through the NTR and to the priority pollutant objectives established by the Regional Boards in their Basin Plans, with the exception of the provision on alternate test procedures for individual discharges that have been approved by the USEPA Regional Administrator. The alternate test procedures provision became effective on May 22, 2000. The SIP became effective on May 18, 2000. The SIP includes procedures for determining the need for WQBELs and for calculating WQBELs. The SIP also requires Dischargers to submit sufficient data to make the determination, and if necessary to calculate the WQBELs. The State Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives, and provisions for chronic toxicity control. Requirements of this WDR implement the SIP.

**L. Compliance Schedules and Interim Requirements**

Current dischargers enrolled in Order No. 2001-96 shall re-enroll no later than 365 days after adoption of this WDR, each discharger currently enrolled in Order

No. 2001-96 shall continue to comply with Order No. 2001-96 until obtaining permit coverage under this WDR.

**M. Antidegradation Policy**

Section 131.12 of 40 CFR requires that State water quality standards include an antidegradation policy consistent with the federal policy. The State Board established California's antidegradation policy in State Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The Regional Boards' Basin Plans implement, and incorporate by reference, both the State and federal antidegradation policies. As discussed in detail in the Fact Sheet, the permitted discharges are consistent with the antidegradation provision of 40 CFR section 131.12 and State Board Resolution No. 68-16.

**N. Anti-Backsliding Requirements**

Sections 402(o)(2) and 303(d)(4) of the CWA and federal regulations of 40 CFR section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. All effluent limitations in this WDR are at least as stringent as the effluent limitations in the previous Order.

**O. Monitoring and Reporting**

Section 122.48 of 40 CFR requires that all NPDES permits specify requirements for recording and reporting monitoring results. Sections 13267 and 13383 of the CWC authorize the Regional Boards to require technical and monitoring reports. The Monitoring and Reporting Program (MRP) establishes monitoring and reporting requirements to implement federal and State requirements. This MRP is provided in Attachment E.

**P. Standard and Special Provisions**

Standard Provisions, which in accordance with 40 CFR sections 122.41 and 122.42 apply to all NPDES discharges and must be included in every NPDES permit, are provided in Attachment D. The Regional Board has also included in this WDR special provisions applicable to the enrolled Dischargers. A rationale for the special provisions contained in this WDR is provided in the attached Fact Sheet (Attachment F).

**Q. Notification of Interested Parties**

The Regional Board has notified the Dischargers, interested agencies and persons of its intent to prescribe WDRs for these discharges, and has provided them with an opportunity to submit their written comments and recommendations. Notification details are provided in the Fact Sheet (Attachment F) of this WDR.

#### **R. Consideration of Public Comment**

The Regional Board, in a public meeting, heard and considered all comments pertaining to the discharges. Details of the Public Hearing are provided in the Fact Sheet of this WDR.

#### **S. Alaska Rule**

On March 30, 2000, USEPA revised its regulation that specifies when new and revised State and Tribal water quality standards (WQS) become effective for CWA purposes (40 CFR section 131.21, 65 FR 24641, April 27, 2000). Under the revised regulation (also known as the Alaska rule), USEPA must approve new and revised standards submitted to USEPA after May 30, 2000, before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA by May 30, 2000, may be used for CWA purposes, whether or not approved by USEPA.

#### **T. Ocean Plan**

In order to protect the beneficial uses of receiving waters from excessive concentrations of pollutants as a result of groundwater extraction waste discharges, this Order does not provide for a mixing zone or a zone of initial dilution except when the discharge is to the surf zone. This Order allows initial dilution of 3 in a surf zone.

### **IV. Discharge Prohibitions**

- A.** The discharge of wastewater at a location, or in a manner different from that described in the Findings, NOI, or Notice of Enrollment letter from the Regional Board is prohibited.
- B.** The discharge of wastewater shall not create or cause conditions of nuisance or pollution.
- C.** The discharge shall not cause, have a reasonable potential to cause, or contribute to an in-stream excursion above any applicable criterion promulgated by USEPA pursuant to section 303 of the CWA, or water quality objective adopted by the State or Regional Boards.
- D.** The discharge of waste to areas designated by the State Board as being of special (ASBS) biological significance is prohibited. Discharges shall be located a sufficient distance from such designated areas to assure maintenance of natural water quality conditions in these areas.
- E.** The discharge of groundwater extraction wastes from a specific site in excess of the flowrate specified in the Notice of Enrollment from the Regional Board is prohibited, unless the enrollee obtains a revised discharge Notice of Enrollment authorizing an increased flowrate.
- F.** The addition of pollutants to extracted groundwater to be discharged to surface waters within the San Diego Region except San Diego Bay is prohibited. The

only exception to this prohibition is that chemicals may be added to extracted groundwater to control biofouling in treatment systems, provided that extracted groundwater discharged meets the effluent limitations for such chemicals established by this WDR and in the discharge Notice of Enrollment issued by the Regional Board.

- G. The discharge of groundwater extraction wastes to surface waters within the San Diego Region except San Diego Bay is prohibited unless an NOI has been submitted, and the Regional Board has provided the Discharger with a written Notice of Enrollment identifying the discharge subject to waste discharge requirements.
- H. The discharge of groundwater extraction wastes from a groundwater remediation operation after the date groundwater has been remediated to the satisfaction of the Regional Board is prohibited.
- I. Compliance with Discharge Prohibitions contained in the Basin Plan is also required as a condition of this WDR.
- J. Discharges of wastes in a manner, or to a location which have not been specifically regulated by waste discharge requirements of this WDR are prohibited.
- K. The discharge of any radiological, chemical, or biological warfare agent, or high level radiological waste is prohibited.
- L. The dumping or deposition, from shore, of oil, garbage, trash, or other solid municipal, industrial, or agricultural waste directly into waters subject to tidal action or adjacent to waters subject to tidal action in any manner which may permit it to be washed into waters subject to tidal action is prohibited.
- M. The dumping or deposition of chemical agents or explosives into waters subject to tidal action is prohibited.

## **V. Effluent Limitations and Discharge Specifications**

### **A. Effluent Limitations**

#### **Summary of Water Quality-Based Effluent Limitations**

##### **Discharge Point**

##### **Summary of Water Quality-based Effluent Limitations Table**

### **1. DISCHARGES TO BAYS AND HARBORS**

The discharge of groundwater extraction waste to Mission Bay, Oceanside Harbor, Del Mar Boat Basin, or Dana Point Harbor shall not contain pollutants in excess of the following effluent limitations:

General / Inorganic / Biological

| Parameter               | Units          | Effluent Limitations                                  |                   |                   |                       |                 |

## 2. DISCHARGES TO LAGOONS/ESTUARIES

The discharge of groundwater extraction waste discharges to saline lagoons (only Buena Vista Lagoon is fresh water) and estuaries of the region shall not contain pollutants in excess of the following effluent limitations:

Includes limits to the Bays and Harbors Limitations

| Parameter   | Units | Effluent Limitations                                  |      |                       |                   |
|---|-------|---|------|-----------------------|-------------------|
|   |       | AMEL  | MDEL | Instantaneous Maximum | 6-Month Median    |
| Total Nitrogen  | mg/L  | -   | -    | 2.0 <sup>AB</sup>     | 1.0 <sup>AB</sup> |
| Total Phosphorus  | mg/L  | -   | -    | .0.2 <sup>AB</sup>    | 0.1 <sup>AB</sup> |
| pH  | Units | Within limit of 7.0 to 8.5 at all times <sup>AB</sup> |      |                       |                   |
| All Parameters and Effluent Limitations from “Bays and Harbors” |       |   |      |                       |                   |

## 3. DISCHARGES TO THE SURF ZONE

The discharge of groundwater extraction waste to the surf zone (3:1 dilution factor) shall not contain pollutants in excess of the following effluent limitations:

Discharges to the Surf Zone Calculation

The formula used to calculate effluent limits for constituents discharged to the surf zone is from Table B in the Ocean Plan except for Toxicity and Radioactivity.

$$Ce = Co + Dm(Co - Cs)$$

Ce = the effluent concentration limit, ug/L

Co = the concentration (water quality objective) to be met at the completion of initial dilution, ug/L

Dm = minimum probable initial dilution expressed as parts seawater per part wastewater

Dm = 3 from findings from the 2001-96 Order.  
Cs = background seawater concentration (see Table C), ug/L

| Table C<br>BACKGROUND SEAWATER CONCENTRATIONS (Cs) |           |
|--|-----------|
| Waste Constituent                                  | Cs (ug/L) |
| Arsenic  | 3         |
| Copper   | 2         |
| Mercury  | 0.0005    |
| Silver   | 0.16      |
| Zinc   | 8         |
| For all other Table B<br>parameters                | 0         |

## DISCHARGES TO THE SURF ZONE (3:1 DILUTION FACTOR)<sup>AB</sup>

#### 4. DISCHARGES TO INLAND SURFACE WATERS

The discharge of groundwater extraction waste to inland surface waters (including Buena Vista Lagoon) shall not contain pollutants in excess of the following effluent limitations:

##### GENERAL CONSTITUENTS

| Constituent            | Unit  | AMEL   | Daily Maximum | Instantaneous Maximum | Basis |
|------------------------|-------|--|---------------|-----------------------|-------|
| Settleable Solids      | ml/L  | 0.1  | ---           | 0.2                   | AB    |
| Total Suspended Solids | mg/L  | 30   | ---           | 50                    |       |
| Percent Sodium         | %     | ---  | ---           | 60                    | AB    |
| Total Nitrogen         | mg/L  | 1.0  |               | 2.0                   | "     |
| Total Phosphorus       | mg/L  | 0.1  |               | 0.2                   | "     |
| Methylene Blue         |       |  |               |                       |       |
| Active Substances      | mg/L  | ---  | ---           | 0.5                   | "     |
| Turbidity              | NTU   | Shall not exceed the ambient turbidity of the surface water at any time. |               |                       | "     |
| Fluoride               | mg/L  | ---  | ---           | 1.0                   | "     |
| Hydrogen Sulfide       | µg/L  | 2  | 4             | 10                    | AB    |
| Total Residual         |       |  |               |                       |       |
| Chlorine (TRC)         | µg/L  | 2  | 8             | 10                    | AB    |
| pH                     | Units | Within the limits of 6.5 and 8.5 at all times.                           |               |                       | AB    |
| Acute Toxicity         | TUa   | ---  | ---           | 0.59                  | AB    |

| 126 Priority Pollutants (Including metals) | 40 CFR 131.38 - Water Quality Standards; Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California. |                          |       |                           |                          | See Below |

126 Priority Pollutants - 40 CFR 131.38 - Water Quality Standards; Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California.

The effluent limits for eight priority pollutants will be developed on a case-by-case basis because the freshwater criteria are based on site-specific water quality data.

Seven metals are dependent on water hardness, Cadmium, Copper, Chromium (III), Lead, Nickel, Silver, and Zinc [See Table 1 to 40 CFR 131.38(b)(2)], and the "Conversion Factors" for Cadmium and Lead are also water hardness dependent. [See Table 3 of 40 CFR 131.38(b)(2)]

In order to calculate the effluent limits for these seven metals the following equations from 40 CFR 131.38(b)(2) will be needed:

$$\begin{aligned} \text{Cd CFa} &= 1.136672 - ((\text{LN}(\text{hardness})) * 0.041838) \\ \text{Cd CFc} &= 1.101672 - ((\text{LN}(\text{hardness})) * 0.041838) \\ \text{Pb CFa\&c} &= 1.46203 - ((\text{LN}(\text{hardness})) * 0.145712) \\ \text{Criterion} &= \text{WER} * \text{CFx} * (\exp(\text{mA} * \text{LN}(\text{hardness})) + \text{bA}) \end{aligned}$$

Pentachlorophenol is dependent on the pH value. [See Footnote "f" to Table in 40 CFR 131.38(b)(1)]

To calculate the effluent limit for Pentachlorophenol use this equation:  
 $CMC = \exp(1.005(pH) - 4.869)$ .  $CCC = \exp(1.005(pH) - 5.134)$

The remainder of the criteria is not water quality dependent and the effluent limits can be calculated. However, not all the effluent limits will apply to all sites because of the Beneficial use designation for "Municipal" may not apply to all sites.

### Effluent Limits for Human Health Municipal and Non-Municipal

|    |                       | Human Health |          |         |         |

\*\* Use equations from 40 CFR 131.38(b)(1) footnote "f"

#### Mass Limits

All permit limitations, standards or prohibitions shall be expressed in terms of mass except for pH, or other pollutants which cannot appropriately be expressed by mass or under certain circumstances including "when applicable standards and limitations are expressed in terms of other units of measurement." (40 CFR § 122.45(f)(1)). Therefore, all concentration limits stated above except for Settleable Solids, Acute Toxicity, Chronic Toxicity, Total Coliform, Fecal Coliform, pH, and Dissolved Oxygen shall also have a mass limit based on its concentration limit times the discharge flow limit in the Notice of Enrollment expressed in pounds per day (lbs/d) as shown in the equations below:

$$\begin{aligned} \text{Concentration Limit} * \text{Flow Limit} * \text{Conversion Factor} &= \text{Mass Limit} \\ (\text{mg/l}) * (\text{MGD}) * 8.34 [\text{lb} * \text{L} / (\text{Million Gallons} * \text{mg})] &= \text{lbs/day} \\ (\mu\text{g/l}) * (\text{MGD}) * 0.00834 [\text{lb} * \text{L} / (\text{Million Gallons} * \mu\text{g})] &= \text{lbs/day} \\ (\text{mg/l}) * (\text{gpd}) * 0.00000834 [\text{lb} * \text{L} / (\text{Gallons} * \text{mg})] &= \text{lbs/day} \\ (\mu\text{g/l}) * (\text{gpd}) * 0.0000000834 [\text{lb} * \text{L} / (\text{Million Gallons} * \mu\text{g})] &= \text{lbs/day} \end{aligned}$$

5. **Interim Effluent Limitations (Not Applicable)**

6. **Land Discharge Specifications (Not Applicable)**

7. **Reclamation Specifications (Not Applicable)**

B. **Land Discharge Specifications (Not Applicable)**

C. **Reclamation Specifications (Not Applicable)**

## **VI. Receiving Water Limitations**

### **A. Surface Water Limitations**

Receiving water limitations are based on water quality objectives contained in the Basin Plan and are a required part of this WDR. The discharge of groundwater extraction waste from any site shall not, separately or jointly with any other discharge, cause violations of the following water quality objectives. These

limitations apply unless more stringent provisions exist in either the Basin Plan, or an applicable State plan. The more stringent limitation shall apply.

## 1. Bacterial Characteristics

### a. Water-Contact Standards

Within a zone bounded by the shoreline and a distance of 1,000 feet from the shoreline or the 30-foot depth contour, whichever is further from the shoreline, and in areas outside this zone used for water-contact sports, as determined by the Regional Board, the following bacterial objectives shall be maintained throughout the water column:

- (1) Samples of water from each sampling station shall have a density of total coliform organisms less than 1,000 per 100 ml (10 per ml); provided that not more than 20 percent of the samples at any sampling station, in any 30-day period, may exceed 1,000 per 100 ml (10 per ml), and provided further that no single sample when verified by a repeat sample taken within 48 hours shall exceed 10,000 per 100 ml (100 per ml).
- (2) The fecal coliform density based on a minimum of not less than five samples for any 30-day period shall not exceed a geometric mean of 200 per 100 ml nor shall more than 10 percent of the total samples during any 60-day period exceed 400 per 100 ml.

### b. Shellfish Harvesting Standards

At all areas where shellfish may be harvested for human consumption, as determined by the Regional Board, the following bacterial objectives shall be maintained throughout the water column:

The median total coliform density shall not exceed 70 per 100 ml, and not more than 10 percent of the samples shall exceed 230 per 100 ml.

## 2. Physical Characteristics

- a. Floating particulates and grease and oil shall not be visible.
- b. The discharge of waste shall not cause aesthetically undesirable discoloration of the surface waters.
- c. Natural light shall not be significantly reduced.  
The rate of deposition of solids and the characteristics of inert solids in the sediments shall not be changed such that benthic communities are degraded.

## 3. Chemical Characteristics

- a. The dissolved oxygen concentration shall not at any time be depressed more than 10 percent from that which occurs naturally, as a result of the discharge of oxygen demanding waste materials.
- b. The pH shall not be changed at any time more than 0.2 units from that which occurs naturally.

- c. The dissolved sulfide concentration of waters in and near sediments shall not be significantly increased above that present under natural conditions.
  - d. The concentration of substances set forth in the Discharge Specifications in marine sediments shall not be increased to levels which would degrade indigenous biota.
  - e. The concentration of organic materials in the sediments shall not be increased to levels which would degrade marine life.
  - f. Nutrient materials shall not cause objectionable aquatic growth or degrade indigenous biota.
4. Biological Characteristics
- a. Marine communities, including vertebrate, invertebrate, and plant species, shall not be degraded.
  - b. The natural taste, odor, and color of fish, shellfish, or other aquatic resources used for human consumption shall not be altered.
  - c. The concentration of organic materials in fish, shellfish or other aquatic resources used for human consumption shall not bioaccumulate to levels that are harmful to human health.
5. Radioactivity
- Discharge of radioactive waste shall not degrade marine life.
6. Toxic Materials Limitations for Marine Waters (Surf Zone) Ocean Plan, 2005

### OBJECTIVES FOR PROTECTION OF MARINE AQUATIC LIFE

7. Toxic Materials Limitations and Objectives for Inland Surface Waters  
(Fresh)

- (a) Discharges of extracted groundwater shall not cause violations of surface water quality objectives presented by hydrographic subunit and subarea in Table 3-2 of the Comprehensive Water Quality Control Plan Report, San Diego Basin (9), as amended.
- (b) Discharges of extracted groundwater shall not cause violations of the following objectives in inland surface waters:
  1. No individual pesticide or combination of pesticides shall be present in concentrations that adversely affect beneficial uses. There shall be no increase in pesticide concentrations found in bottom sediments or aquatic life.
  2. For the protection of public health and aquatic species, waters designated for use as domestic or municipal supply (MUN) shall not contain concentrations of toxics in excess of the maximum contaminant levels for contaminants set forth in the California Code of Regulations, Title 22, as amended, or water quality objectives listed in 40 CFR 131.38 (Attachment D), for the protection of aquatic species and protection of human health, whichever concentration for a specific chemical is less. Current maximum

contaminant levels for the protection of human health from the ingestion of water are as follows:

| <u>Constituent</u>    | <u>Title22 Maximum<br/>Contaminant Level (mg/L)</u> |

9. Waters designated for use as agricultural supply (AGR) shall not contain concentrations of chemical constituents in amounts that adversely affect such beneficial use.

10. Radioactivity: Discharges of radioactive waste shall not degrade marine life.

## **B. Groundwater Limitations (Not Applicable)**

## **VII. Provisions**

### **A. Standard Provisions**

1. The Discharger shall comply with all Standard Provisions included in Attachment D of this WDR.
2. Regional Board Standard Provisions. The Discharger shall comply with the following provisions:
  - a. The Discharger shall comply with all requirements and conditions of this WDR. Any permit non-compliance constitutes a violation of the CWA and/or of the CWC and is grounds for enforcement action, permit termination, revocation and reissuance, or modification, or for denial of an application for permit renewal, modification, or reissuance.
  - b. The Discharger shall comply with all applicable federal, state, and local laws and regulations for handling, transport, treatment, or disposal of waste or the discharge of waste to waters of the state in a manner which causes or threatens to cause a condition of pollution, contamination or nuisance as those terms are defined in CWC 13050.
  - c. The Porter-Cologne Water Quality Control Act provides for civil and criminal penalties comparable to, and in some cases greater than, those provided for under the CWA.
  - d. Any noncompliance with this WDR is a violation of the CWC and/or the CWA and is grounds for denial of an application for Order renewal or modification.
  - e. No discharge of waste into waters of the state, whether or not the discharge is made pursuant to WDRs, shall create a vested right to continue the discharge. All discharges of waste into waters of the state are privileges, not rights.
  - f. For the purposes of this WDR, the term "permittee" used in parts of 40 CFR incorporated into this WDR by reference and/or applicable to this WDR shall have the same meaning as the term "Discharger" used elsewhere in this WDR.

- g. This WDR expires on March 12, 2013, after which, the terms and conditions of this permit are automatically continued pending issuance of a new WDR, provided that all requirements of USEPA's NPDES regulations at 40 CFR 122.6 and the State's regulations at CCR Title 23, Section 2235.4 regarding the continuation of expired Orders and waste discharge requirements are met.
- h. Except as provided for in 40 CFR 122.7, no information or documents submitted in accordance with or in application for this permit will be considered confidential, and all such information and documents shall be available for review by the public at the office of the Regional Water Board.
- i. A copy of this WDR shall be maintained on-site at the Facility, and shall be available to Regional Water Board, State Water Board, and EPA personnel and/or their authorized representatives at all times.
- j. The Discharger shall comply with any interim limitations established by addendum, enforcement action, or revised waste discharge requirements that have been or may be adopted by the Regional Water Board.
- k. Failure to comply with provisions or requirements of this WDR, or violation of other applicable laws or regulations governing discharges from this facility, may subject the Discharger to administrative or civil liabilities, criminal penalties, and/or other enforcement remedies to ensure compliance. Additionally, certain violations may subject the Discharger to civil or criminal enforcement from appropriate local, state, or federal law enforcement entities.
- l. In the event the Discharger does not comply or will be unable to comply for any reason, with any prohibition, effluent limitation, discharge specification, or receiving water limitation of this WDR, the Discharger shall notify the Regional Water Board by telephone (858) 467-2952 within 24 hours of having knowledge of such noncompliance, and shall confirm this notification in writing within five days, unless the Regional Water Board waives confirmation. The written notification shall state the nature, time, duration, and cause of noncompliance, and shall describe the measures being taken to remedy the current noncompliance and prevent recurrence including, where applicable, a schedule of implementation. Other noncompliance requires written notification as above at the time of the normal monitoring report.
- m. The Discharger is required to retain records, including all monitoring information and copies of all reports required by this WDR, for five years unless directed otherwise by the Regional Board.
- n. This WDR may be modified, revoked and reissued, or terminated for cause due to promulgation of amended regulations, receipt of USEPA

guidance concerning regulated activities, judicial decision, or in accordance with 40 Code of Federal Regulations (CFR) 122.62, 122.63, 122.64, and 124.5.

- o. Dischargers enrolled in this WDR planning to discharge extracted groundwater waste after the expiration date of March 12, 2013 may be subject to new prohibitions or requirements based on the re-issuance of this WDR after March 12, 2013.
- p. The enrollee shall take all reasonable steps to minimize or correct any adverse impact on the environment resulting from noncompliance with this WDR and the Notice of Enrollment from the Regional Board, including such accelerated or additional monitoring as may be necessary to determine the nature, and effect of the noncomplying discharge.
- q. This WDR or the Notice of Enrollment from the Regional Board, may be modified, revoked and reissued, or terminated for cause including, but not limited to, the following:
  - (1) Violation of any terms or conditions of this WDR or the Notice of Enrollment from the Regional Board;
  - (2) Obtaining enrollment in this WDR, or a Notice of Enrollment from the Regional Board, by misrepresentation or failure to disclose fully all relevant facts;
  - (3) A change in any condition that requires either a temporary or permanent reduction or elimination of the discharge subject to waste discharge requirements; or
  - (4) A finding that monitoring "indicator" pollutants listed in this WDR do not ensure compliance with water quality criteria or objectives for the pollutants expected to be represented by the "indicator" pollutants.
- r. The filing of a request by the enrollee for modification, revocation and reissuance, or termination of this WDR or an associated discharge Notice of Enrollment from the Regional Board, or a notification of planned change in or anticipated noncompliance with this WDR or discharge Notice of Enrollment does not stay any condition of this WDR or the Notice of Enrollment from the Regional Board.

- s. Notwithstanding Provision 2.e above, if any applicable toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under Section 307(a) of the CWA for a toxic pollutant and that standard or prohibition is more stringent than any limitation on the pollutant in this WDR, the Regional Board may institute proceedings under these regulations to modify or revoke and reissue this WDR to conform to the toxic effluent standard or prohibition.
- t. In addition to any other grounds specified herein, this WDR or a Notice of Enrollment from the Regional Board shall be modified or revoked at any time if, on the basis of any data, the Regional Board determines that continued discharges may cause unreasonable degradation of the aquatic environment.
- u. The Regional Board or the Director of the USEPA may require any person requesting enrollment under this WDR or subject to waste discharge requirements under this WDR to apply for and obtain an individual NPDES permit. Cases where an individual NPDES permit may be required include but are not limited to those described in 40 CFR 122.28 (b)(3)(i) and (b)(3)(ii), and where the volume of a discharge exceeds 10 million gallons per year, or the duration of a discharge exceeds 3 years.
- v. It shall not be a defense for the enrollee in an enforcement action that effluent limitation violations are a result of analytical variability rendering the results inaccurate. The validity of the testing results, whether or not the enrollee has monitored or sampled more frequently than required by this WDR, shall not be a defense to an enforcement action.
- w. A copy of this WDR, and the Notice of Enrollment from the Regional Board shall be posted at a prominent location at or near the enrollee's facility, and shall be available to operating personnel at all times.
- x. The enrollee shall take all reasonable steps to minimize or prevent any discharge in violation of this WDR which has a reasonable likelihood of adversely affecting human health or the environment.
- y. For the purposes of this WDR, the term permit, general permit, and order, shall have the same meaning as the term WDR used elsewhere in this WDR.
- z. For the purpose of this WDR, the term Discharger and enrollee shall have the same meaning as the term discharger used elsewhere in this WDR.

## **B. Monitoring and Reporting Program Requirements**

The Discharger shall comply with the MRP, and future revisions thereto, in Attachment E of this WDR.

### **C. Special Provisions**

1. Reopener Provisions (Not Applicable)
2. Special Studies, Technical Reports and Additional Monitoring Requirements (Not Applicable)
3. Best Management Practices and Pollution Prevention Plan (Not Applicable)
4. Compliance Schedules (Not Applicable)
5. Construction, Operation and Maintenance Specifications (Not Applicable)
6. Special Provisions for Municipal Facilities (POTWs Only) (Not Applicable)
7. Other Special Provisions

The Dischargers shall dispose of solids removed from liquid wastes in a manner that is consistent with Title 27 of the CCR and approved by the Regional Board.

8. Order No. R9-2008-0002 may be modified by the Regional Board and EPA to enable the discharger to participate in comprehensive regional monitoring activities conducted in the Southern California Bight during the term of this permit. The intent of regional monitoring activities is to maximize the efforts of all monitoring partners using a more cost-effective monitoring design and to best utilize the pooled scientific resources of the region. During these coordinated sampling efforts, the discharger's sampling and analytical effort may be reallocated to provide a regional assessment of the impact of the discharge of municipal wastewater to the Southern California Bight. Anticipated modifications to the monitoring program will be coordinated so as to provide a more comprehensive picture of the ecological and statistical significance of monitoring results and to determine cumulative impacts of various pollution sources. If predictable relationships among the biological, water quality and effluent monitoring variables can be demonstrated, it may be appropriate to decrease the discharger's sampling effort. Conversely, the monitoring program may be intensified if it appears that the objectives cannot be achieved through the discharger's existing monitoring program. These changes will improve the overall effectiveness of monitoring in the Southern California Bight. Minor changes may be made without further public notice.

---

### **VIII. Compliance Determination**

Compliance with the effluent limitations contained in Section IV of this WDR will be determined as specified below:

**A. Average Monthly Effluent Limitation (AMEL)**

If the average of daily discharges over a calendar month exceeds the AMEL for a given parameter, an alleged violation will be flagged and the Discharger will be considered out of compliance for each day of that month for that parameter (e.g., resulting in 31 days of non-compliance in a 31-day month). The average of daily discharges over the calendar month that exceeds the AMEL for a parameter will be considered out of compliance for that month only. If only a single sample is taken during the calendar month and the analytical result for that sample exceeds the AMEL, the Discharger will be considered out of compliance for that calendar month. For any one calendar month during which no sample (daily discharge) is taken, no compliance determination can be made for that calendar month.

**B. Average Weekly Effluent Limitation (AWEL)**

If the average of daily discharges over a calendar week exceeds the AWEL for a given parameter, an alleged violation will be flagged and the Discharger will be considered out of compliance for each day of that week for that parameter, resulting in seven days of non-compliance. The average of daily discharges over the calendar week that exceeds the AWEL for a parameter will be considered out of compliance for that week only. If only a single sample is taken during the calendar week and the analytical result for that sample exceeds the AWEL, the Discharger will be considered out of compliance for that calendar week. For any one calendar week during which no sample (daily discharge) is taken, no compliance determination can be made for that calendar week.

**C. Maximum Daily Effluent Limitation (MDEL)**

If a daily discharge exceeds the MDEL for a given parameter, an alleged violation will be flagged and the Discharger will be considered out of compliance for that parameter for that one day only within the reporting period. For any one day during which no sample is taken, no compliance determination can be made for that day.

**D. Instantaneous Minimum Effluent Limitation**

If the analytical result of a single grab sample is lower than the instantaneous minimum effluent limitation for a parameter, a violation will be flagged and the Discharger will be considered out of compliance for that parameter for that single sample. Non-compliance for each sample will be considered separately (e.g., the results of two grab samples taken within a calendar day that both are lower than the instantaneous minimum effluent limitation would result in two instances of non-compliance with the instantaneous minimum effluent limitation).

**E. Instantaneous Maximum Effluent Limitation**

If the analytical result of a single grab sample is higher than the instantaneous maximum effluent limitation for a parameter, a violation will be flagged and the Discharger will be considered out of compliance for that parameter for that single sample. Non-compliance for each sample will be considered separately

(e.g., the results of two grab samples taken within a calendar day that both exceed the instantaneous maximum effluent limitation would result in two instances of non-compliance with the instantaneous maximum effluent limitation).

#### **F. Six-Month Median Effluent Limitation**

The Discharger shall determine the six-month median effluent value (SMEV) for a given parameter by calculating the statistical median of all daily effluent values (DEVs) for each parameter within each six-month calendar period (January-June and July-December). The SMEV determination for a given six-month calendar period shall not include DEVs from any other six-month calendar period. If only a single DEV is obtained for a parameter during a six-month calendar period, that DEV shall be considered the SMEV for that parameter for that given six-month calendar period. The SMEV shall be attributed to each day of the six-month calendar period for determination of compliance with the six-month median effluent limitation (SMEL) for a given parameter for each day of that given six-month calendar period, resulting in approximately 180 days of non-compliance depending on the number of days in the six-month calendar period. If the SMEV exceeds the six-month median, the Discharger will be considered out of compliance for each day for the six-month period. The SMEV cannot be determined for any six month calendar period during which no DEV is obtained.

## Attachment A – Definitions

**Arithmetic Mean ( $\mu$ ),** also called the average: the sum of measured values divided by the number of samples. For ambient water concentrations, the arithmetic mean is calculated as follows:

$$\text{Arithmetic mean} = \mu = \Sigma x / n \quad \text{where: } \Sigma x \text{ is the sum of the measured ambient water concentrations, and } n \text{ is the number of samples.}$$

**Average Monthly Effluent Limitation (AMEL):** the highest allowable average of daily discharges over a calendar month, calculated as the sum of all daily discharges measured during a calendar month divided by the number of daily discharges measured during that month.

**Average Weekly Effluent Limitation (AWEL):** the highest allowable average of daily discharges over a calendar week (Sunday through Saturday), calculated as the sum of all daily discharges measured during a calendar week divided by the number of daily discharges measured during that week.

**Bioaccumulative Pollutants:** those substances taken up by an organism from its surrounding medium through gill membranes, epithelial tissue, or from food and subsequently concentrated and retained in the body of the organism.

**Carcinogenic Pollutants:** substances that are known to cause cancer in living organisms.

**Coefficient of Variation (CV):** a measure of the data variability and is calculated as the estimated standard deviation divided by the arithmetic mean of the observed values.

**Cone of Depression:** A depression in the water table that develops around a pumped well.

**Cone of Influence:** The depression, roughly conical in shape, produced in a water table by the pumping of water from a well.

**Contamination Site:** A site that is currently under investigation or cleanup for any medium (air, soil, water), or is provided oversight by any local, state, or federal environmental regulatory agency, such as the County of San Diego, Air Pollution Control District, and Department of Toxics Substance Control, or the quality of surface water or groundwater at a site has been altered by wastes to a degree which unreasonably affects either the waters for beneficial uses or facilities which serve these beneficial uses.

**Daily Discharge:** Daily Discharge is defined as either: (1) the total mass of the constituent discharged over the calendar day (12 a.m. through 11:59 p.m.) or any 24-hour period that reasonably represents a calendar day for purposes of sampling (as specified in the permit), for a constituent with limitations expressed in units of mass or;

(2) the unweighted arithmetic mean measurement of the constituent over the day for a constituent with limitations expressed in other units of measurement (e.g., concentration).

The daily discharge may be determined by the analytical results of a composite sample taken over the course of one day (a calendar day, or other 24-hour period defined as a day), or by the arithmetic mean of analytical results from one or more grab samples taken over the course of the day.

For composite sampling, if one day is defined as a 24-hour period other than a calendar day, the analytical result for the 24-hour period will be considered as the result for the calendar day in which the 24-hour period ends.

**Detected, but Not Quantified (DNQ):** those sample results less than the Reporting Level (RL), but greater than or equal to the laboratory's Method Detection Limit (MDL).

**Dilution Credit:** the amount of dilution granted to a Discharger in the calculation of a water quality-based effluent limitation, based on the allowance of a specified mixing zone. It is calculated from the dilution ratio, or determined through conducting a mixing zone study, or modeling of the discharge and receiving water.

**Effluent Concentration Allowance (ECA):** a value derived from the water quality criterion/objective, dilution credit, and ambient background concentration that is used, in conjunction with the coefficient of variation for the effluent monitoring data, to calculate a long-term average (LTA) discharge concentration. The ECA has the same meaning as waste load allocation (WLA) as used in USEPA guidance (Technical Support Document For Water Quality-based Toxics Control, March 1991, second printing, EPA/505/2-90-001).

**Enclosed Bays:** indentations along the coast that enclose an area of oceanic water within distinct headlands or harbor works. Enclosed bays include all bays where the narrowest distance between the headlands or outermost harbor works is less than 75 percent of the greatest dimension of the enclosed portion of the bay. Enclosed bays include, but are not limited to, Humboldt Bay, Bodega Harbor, Tomales Bay, Drake's Estero, San Francisco Bay, Morro Bay, Los Angeles-Long Beach Harbor, Upper and Lower Newport Bay, Mission Bay, and San Diego Bay. Enclosed bays do not include inland surface waters or ocean waters.

**Notice of Enrollment:** A notice from the Regional Board to the discharger that the NOI application has been accepted and the project is enrolled in this WDR. The Notice of Enrollment will specify the discharge flow limit, any additional or increase in monitoring due to specific circumstances of the discharge, or other requirements.

**Estimated Chemical Concentration:** the estimated chemical concentration that results from the confirmed detection of the substance by the analytical method below the Minimum Level value.

**Estuaries:** waters, including coastal lagoons, located at the mouths of streams that serve as areas of mixing for fresh and ocean waters. Coastal lagoons and mouths of streams that are temporarily separated from the ocean by sandbars shall be considered estuaries. Estuarine waters shall be considered to extend from a bay or the open ocean to a point upstream where there is no significant mixing of fresh water and seawater. Estuarine waters included, but are not limited to, the Sacramento-San Joaquin Delta, as defined in Water Code section 12220, Suisun Bay, Carquinez Strait downstream to the Carquinez Bridge, and appropriate areas of the Smith, Mad, Eel, Noyo, Russian, Klamath, San Diego, and Otay rivers. Estuaries do not include inland surface waters or ocean waters.

**Inland Surface Waters:** all surface waters of the State that do not include the ocean, enclosed bays, or estuaries. Inland surface water consist of freshwater and do not have any measurable salinity.

**Instantaneous Maximum Effluent Limitation:** the highest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous maximum limitation).

**Instantaneous Minimum Effluent Limitation:** the lowest allowable value for any single grab sample or aliquot (i.e., each grab sample or aliquot is independently compared to the instantaneous minimum limitation).

**Maximum Daily Effluent Limitation (MDEL):** the highest allowable daily discharge of a pollutant, over a calendar day (or 24-hour period). For pollutants with limitations expressed in units of mass, the daily discharge is calculated as the total mass of the pollutant discharged over the day. For pollutants with limitations expressed in other units of measurement, the daily discharge is calculated as the arithmetic mean measurement of the pollutant over the day.

**Median:** the middle measurement in a set of data. The median of a set of data is found by first arranging the measurements in order of magnitude (either increasing or decreasing order). If the number of measurements ( $n$ ) is odd, then the median =  $X_{(n+1)/2}$ . If  $n$  is even, then the median =  $(X_{n/2} + X_{(n/2)+1})/2$  (i.e., the midpoint between the  $n/2$  and  $n/2+1$ ).

**Method Detection Limit (MDL):** the minimum concentration of a substance that can be measured and reported with 99 percent confidence that the analyte concentration is greater than zero, as defined in title 40 of the Code of Federal Regulations, Part 136, Attachment B, revised as of July 3, 1999.

**Minimum Level (ML):** the concentration at which the entire analytical system must give a recognizable signal and acceptable calibration point. The ML is the concentration in a sample that is equivalent to the concentration of the lowest calibration standard analyzed by a specific analytical procedure, assuming that all the method specified sample weights, volumes, and processing steps have been followed.

**Mixing Zone:** a limited volume of receiving water that is allocated for mixing with a wastewater discharge where water quality criteria can be exceeded without causing adverse effects to the overall water body.

**Not Detected (ND):** those sample results less than the laboratory's MDL.

**Notice of Intent (NOI):** A form completed and signed by a Discharger notifying the Regional Board that the Discharger is applying for enrollment under the terms and conditions of the WDR and will comply with the WDR for a groundwater extraction activity at a specific site.

**Notice of Termination (NOT):** A letter completed and signed by a Discharger notifying the Regional Board that the Discharger no longer wishes to discharge under the WDR. Submission of a NOT constitutes notice that the owner (and his/her agent) of the site identified on the letter has ceased discharge groundwater associated with groundwater extraction activities at the site under this WDR.

**Ocean Waters:** the territorial marine waters of the State as defined by California law to the extent these waters are outside of enclosed bays, estuaries, and coastal lagoons. Discharges to ocean waters are regulated in accordance with the State Board's California Ocean Plan.

**Permanent groundwater extraction activities:** Groundwater extraction operations for structures which 1) are not designed or constructed to withstand hydrostatic pressure or do not preclude infiltration of groundwater, and 2) require removal of groundwater to prevent water infiltration to the structure(s).

**Persistent pollutants:** substances for which degradation or decomposition in the environment is nonexistent or very slow.

**Radius of Influence:** The radial distance from the center of a wellbore to the point where there is no lowering of the water table or potentiometric surface (the edge of the cone of depression).

**Reporting Level (RL):** the ML (and its associated analytical method) chosen by the Discharger for reporting and compliance determination from the MLs included in this WDR. The MLs included in this WDR correspond to approved analytical methods for reporting a sample result that are selected by the Regional Board either from Appendix 4 of the SIP in accordance with section 2.4.2 of the SIP, or established in accordance with section 2.4.3 of the SIP. The ML is based on the proper application of method-based analytical procedures for sample preparation and the absence of any matrix interferences. Other factors may be applied to the ML depending on the specific sample preparation steps employed. For example, the treatment typically applied in cases where there are matrix-effects is to dilute the sample or sample aliquot by a factor of ten. In such cases, this additional factor must be applied to the ML in the computation of the RL.

**Satellite Collection System:** the portion, if any, of a sanitary sewer system owned or operated by a different public agency than the agency that owns and operates the wastewater treatment facility that a sanitary sewer system is tributary to.

**Six-Month Median Effluent Limitation:** the highest allowable median of all daily discharges, based on 24-hour flow-weighted composite samples, for any 180-day period.

**Source of Drinking Water:** any water designated as municipal or domestic supply (MUN) in a Regional Board Basin Plan.

**Standard Deviation ( $\sigma$ ):** a measure of variability that is calculated as follows:

$$\sigma = (\sum[(x - \mu)^2]/(n - 1))^{0.5}$$

where:

x is the observed value;

$\mu$  is the arithmetic mean of the observed values; and

n is the number of samples.

**Temporary Discharge:** Discharge of extracted groundwater waste from groundwater cleanup with a projected cleanup date and subsurface excavation that requires groundwater extraction that is not a permanent groundwater extraction activity.

Discharges of groundwater for the purpose of protecting subterranean structures from groundwater infiltration are not considered groundwater cleanup projects, whether or not such discharges cleanup or remove pollutants from the groundwater. These activities may be covered under the statewide general NPDES permit for discharges from utility vaults and underground structures to surface water (CAG990002).

**Toxicity Reduction Evaluation (TRE):** a study conducted in a step-wise process designed to identify the causative agents of effluent or ambient toxicity, isolate the sources of toxicity, evaluate the effectiveness of toxicity control options, and then confirm the reduction in toxicity. The first steps of the TRE consist of the collection of data relevant to the toxicity, including additional toxicity testing, and an evaluation of facility operations and maintenance practices, and best management practices. A Toxicity Identification Evaluation (TIE) may be required as part of the TRE, if appropriate. (A TIE is a set of procedures to identify the specific chemical[s] responsible for toxicity. These procedures are performed in three phases [characterization, identification, and confirmation] using aquatic organism toxicity tests.)

**Waters of the United States or waters of the U.S.:** (40 e-CFR 122.2, March 20, 2007) (a) All waters which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide; (b) All interstate waters, including interstate "wetlands;" (c) All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, "wetlands," sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters:

(1) Which are or could be used by interstate or foreign travelers for recreational or other purposes; (2) From which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or (3) Which are used or could be used for industrial purposes by industries in interstate commerce; (d) All impoundments of waters otherwise defined as waters of the United States under this definition; (e) Tributaries of waters identified in paragraphs (a) through (d) of this definition; (f) The territorial sea; and (g) "Wetlands" adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) through (f) of this definition. Waste treatment systems, including treatment ponds or lagoons designed to meet the requirements of CWA (other than cooling ponds as defined in 40 CFR 423.11(m) which also meet the criteria of this definition) are not waters of the United States. This exclusion applies only to manmade bodies of water which neither were originally created in waters of the United States (such as disposal area in wetlands) nor resulted from the impoundment of waters of the United States. Waters of the United States do not include prior converted cropland. Notwithstanding the determination of an area's status as prior converted cropland by any other federal agency, for the purposes of the Clean Water Act, the final authority regarding Clean Water Act jurisdiction remains with EPA.

Attachment B1 – Notice of Intent Form

## NOTICE OF INTENT

TO DISCHARGE GROUNDWATER EXTRACTION WASTE  
TO SURFACE WATERS WITHIN THE SAN DIEGO REGION

EXCEPT FOR SAN DIEGO BAY

SUBJECT TO GENERAL WASTE DISCHARGE REQUIREMENTS IN  
ORDER NO. R9-2008-0002 (NPDES NO. CAG919002)

GENERAL WASTE DISCHARGE REQUIREMENTS FOR DISCHARGES FROM  
GROUNDWATER EXTRACTION AND SIMILAR WASTE DISCHARGES TO SURFACE  
WATERS WITHIN THE SAN DIEGO REGION EXCEPT FOR SAN DIEGO BAY (WDR)

Attach Form 200 (completed and signed) and additional sheets as necessary to provide  
complete information requested in this Notice of Intent (NOI).

### I. STIPULATION OF APPLICABILITY AND CERTIFICATION

- ☐ I have determined that the groundwater extracted waste discharge will be to navigable waters of the United States within the San Diego Region and that any violation of effluent limits will be subject to Mandatory Minimum Penalties under California Water Code section 13385(h) and (i).
- ☐ I have determined that this discharge is eligible for enrollment in this General "Waste Discharge Requirements" (WDR) because the discharge will comply with the Discharge Specifications of this WDR.
- ☐ I have read this WDR Order No. R9-2008-0002 and hereby certify that:
  - 1. I understand the requirements of Order No. R9-2008-0002.
  - 2. The enclosed information describing my proposed groundwater extraction waste discharge is accurate and describes a discharge that meets the requirements of Order No. R9-2008-0002, which is the applicable general groundwater extraction waste discharge permit.
  - 3. I will comply with all terms, conditions, and requirements of WDR Order No. R9-2008-0002.

## I. STIPULATION OF APPLICABILITY AND CERTIFICATION

I certify under penalty of law that this document, Form 200, and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those directly responsible for gathering the information, the information submitted is true, accurate, and complete to the best of my knowledge and belief. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment. In addition, I certify that the provisions of the permit, including the criteria for eligibility will be complied with.

A. Printed Name:

B. Signature\*:

C. Date:

D. Title:

\*The appropriate person must sign the application form.

Acceptable signatures are:

1. for a corporation, a principal executive officer of at least the level of senior vice-president;
2. for a partnership or individual (sole proprietorship), a general partner or the proprietor;
3. for a governmental or public agency, either a principal executive officer or ranking elected/appointed official.

## II. ITEMS REQUIRED FOR DETERMINING ELIGIBILITY

- ☐ A. Identify and discuss technical and economic feasibility of alternative disposal options.
- ☐ B. If discharging to an MS4, obtain authorization from the appropriate municipality and submit proof.
- ☐ C. Submit scale appropriate vicinity map(s).
- ☐ D. Submit a completed and signed Form 200 (*Application/Report of Waste Discharge, General Information for Waste Discharge Requirements or NPDES Permit*).

### III. NOTICE OF INTENT STATUS

A. Is this a renewal of an expiring WDR? 1. ☐ No 2. ☐ Yes, Order No.: \_\_\_\_\_

### IV. GROUNDWATER EXTRACTION INFORMATION

A. Nature of Groundwater Extraction Activity:

1. ☐ Subsurface Excavation  
a. ☐ Foundation b. ☐ Tunneling c. ☐ Construction d. ☐ Footing e. ☐ Other \_\_\_\_\_
2. ☐ Remediation Project
3. ☐ Other \_\_\_\_\_

B. ☐ This project is associated with a project that requires Regional Board license, permit, or oversight?  
Explain: Construction storm water, 401 Certifications, WDR, UST or cleanup project, etc.

C. Duration and Start Date

1. Proposed Start Date of Groundwater Extraction Discharge: \_\_\_\_\_
2. Estimated Duration of Groundwater Extraction Discharge: \_\_\_\_\_

D. 1. ☐ Describe the historical use of the land within the cone/radius of influence.

2. ☐ Identify all known contamination sites and ground water plumes within half mile of each groundwater extraction point to be used in the project.  
Attach a source of contamination description and list of constituents.  
Attach site assessment (if one has been done)

E. For each discharge point identify the location of discharge according to the following: (show in vicinity map)

1. ☐ Storm Drain, ☐ Attach proof of authorization from the appropriate municipality for the discharge into the storm drain or conveyance used to convey the discharge.
2. ☐ Directly into surface water, ☐ submerged or ☐ on the surface
3. Salinity of the Tributary at the discharge point \_\_\_\_\_

F. Will treatment be required to meet the Discharge Specifications of this WDR?

1. ☐ Yes 2. ☐ No
- If Yes, attach the following:
- a. ☐ A report certifying the adequacy of each component of the treatment facilities or other type of contingency plan. The report shall also certify that:
- (1) ☐ all treatment facility startup and operation instruction manuals are adequate and available to operating personnel,
  - (2) ☐ adequate treatment facility maintenance and testing (if treatment facilities are on "standby") schedules are included in the treatment facility operations manual,
  - (3) ☐ treatment facilities and appurtenances can be fully operational, as designed, within 24 hours, and
  - (4) ☐ influent and effluent sampling locations or ports are located in areas where samples representative of the waste stream to be monitored can be obtained.
- b. ☐ The design engineer shall affix his/her signature and engineering license number to this certification report.

#### IV. GROUNDWATER EXTRACTION INFORMATION

G. Additional Attachments

1. ☐ Describe best management practices (bmp) and contingency plan.
2. ☐ Provide the results of the analysis of the groundwater to be extracted for all of those constituents, as determined by the sampling requirement criteria described in this WDR, for the proposed receiving water type.

#### V. RECEIVING WATER INFORMATION

A. Name of receiving water(s): (San Diego River, Rainbow Creek, Pacific Ocean, etc.)

B. Describe the types of receiving waters affected: (bay, creek, river, etc.)

C. Receiving water flows seasonally 1. ☐ Yes 2. ☐ No

D. More than one discharge point is proposed?

1. ☐ Yes 2. ☐ No If Yes, how many? \_\_\_\_\_

And distance between points \_\_\_\_\_

Include in Vicinity Map

3. Location of Discharge Points: (attach)  
Example: Outfall 001 (Latitude and Longitude)

E. Proposed Flow (MGD or gpd) of the discharge:

1. Maximum Discharge: \_\_\_\_\_

2. Average Daily Flowrate: \_\_\_\_\_

3. Basis for flow rate estimates (if necessary attach):

F. Hydrologic Subarea Number(s) at the point of discharge:

## VI. APPLICATION FEE

The initial fee and annual fee are based upon the type of pollutants to be discharged or potentially discharged.

Make checks payable to "SWRCB" and include the project's name in the "memo" field.

☐ **Category 3 Lowest Threat to Water Quality**

The discharge will not require any treatment.

Current fee is \$1,000 plus \$185 surcharge = \$1,185

☐ **Category 2 Moderate Threat to Water Quality**

The discharge will be from a well that has a contaminated site within the radius of influence.

Current fee is \$2,900 plus \$537 surcharge = \$3,437

☐ **Category 1 Highest Threat to Water Quality**

The discharge will require treatment to meet effluent limitations.

Current fee is \$4,800 plus \$888 surcharge = \$5,688

## VII. ANTIDEGREDATION POLICIES

- A. ☐ Statement of compliance with 40 CFR 131.12 and State Water Resources Control Board Resolution No. 68-16 (attach) (collectively antidegradation policies)

### 40 CFR 131.12 Antidegradation policy.

(a) The State shall develop and adopt a statewide antidegradation policy and identify the methods for implementing such policy pursuant to this subpart. The antidegradation policy and implementation methods shall, at a minimum, be consistent with the following:

- (1) Existing instream water uses and the level of water quality necessary to protect the existing uses shall be maintained and protected.
- (2) Where the quality of the waters exceed levels necessary to support propagation of fish, shellfish, and wildlife and recreation in and on the water, that quality shall be maintained and protected unless the State finds, after full satisfaction of the intergovernmental coordination and public participation provisions of the State's continuing planning process, that allowing lower water quality is necessary to accommodate important economic or social development in the area in which the waters are located. In allowing such degradation or lower water quality, the State shall assure water quality adequate to protect existing uses fully. Further, the State shall assure that there shall be achieved the highest statutory and regulatory requirements for all new and existing point sources and all cost-effective and reasonable best management practices for nonpoint source control.
- (3) Where high quality waters constitute an outstanding National resource, such as waters of National and State parks and wildlife refuges, and waters of exceptional recreational or ecological significance, that water quality shall be maintained and protected.
- (4) In those cases where potential water quality impairment associated with a thermal discharge is involved, the antidegradation policy and implementing method shall be consistent with section 316 of the Act.

### RESOLUTION NO. 68-16

#### STATEMENT OF POLICY WITH RESPECT TO MAINTAINING HIGH QUALITY OF WATERS IN CALIFORNIA

WHEREAS the California Legislature has declared that it is the policy of the State that the granting of permits and licenses for unappropriated water and the disposal of wastes into the waters of the State shall be so regulated as to achieve highest water quality consistent with maximum benefit to the people of the State and shall be controlled so as to promote the peace, health, safety and welfare of the people of the State; and

WHEREAS water quality control policies have been and are being adopted for waters of the State; and

WHEREAS the quality of some waters of the State is higher than that established by the adopted policies and it is the intent and purpose of this Board that such higher quality shall be maintained to the maximum extent possible consistent with the declaration of the Legislature;

#### NOW, THEREFORE, BE IT RESOLVED:

1. Whenever the existing quality of water is better than the quality established in policies as of the date on which such policies become effective, such existing high quality will be maintained until it has been demonstrated to the State that any change will be consistent with maximum benefit to the people of the State, will not unreasonably affect present and anticipated beneficial use of such water and will not result in water quality less than that prescribed in the policies.
2. Any activity which produces or may produce a waste or increased volume or concentration of waste and which discharges or proposes to discharge to existing high quality waters will be required to meet waste discharge requirements which will result in the best practicable treatment or control of the discharge necessary to assure that (a) a pollution or nuisance will not occur, and (b) the highest water quality consistent with maximum benefit to the people of the State will be maintained.
3. In implementing this policy, the Secretary of the Interior will be kept advised and will be provided with such information as he will need to discharge his responsibilities under the Federal Water Pollution Control Act.

BE IT FURTHER RESOLVED that a copy of this resolution be forwarded to the Secretary of the Interior as part of California's water quality control policy submission.

#### CERTIFICATION

The undersigned, Executive Officer of the State Water Resources Control Board, does hereby certify that the foregoing is a full, true, and correct copy of a resolution duly and regularly adopted at a meeting of the State Water Resources Control Board held on October 24, 1968.

Dated: October 28, 1968

Kerry W. Mulligan, Executive Officer  
State Water Resources Control Board

### VIII. CALIFORNIA CONSTITUTION COMPLIANCE

- A. ☐ Discuss the potential uses of the extracted groundwaters, efforts made to ensure use to the fullest extent possible and compliance with Article 10, Section 2 of the California Constitution (attach)

#### CALIFORNIA CONSTITUTION

##### ARTICLE 10 WATER

SEC. 2. It is hereby declared that because of the conditions prevailing in this State the general welfare requires that the water resources of the State be put to beneficial use to the fullest extent of which they are capable, and that the waste or unreasonable use or unreasonable method of use of water be prevented, and that the conservation of such waters is to be exercised with a view to the reasonable and beneficial use thereof in the interest of the people and for the public welfare. The right to water or to the use or flow of water in or from any natural stream or water course in this State is and shall be limited to such water as shall be reasonably required for the beneficial use to be served, and such right does not and shall not extend to the waste or unreasonable use or unreasonable method of use or unreasonable method of diversion of water. Riparian rights in a stream or water course attach to, but to no more than so much of the flow thereof as may be required or used consistently with this section, for the purposes for which such lands are, or may be made adaptable, in view of such reasonable and beneficial uses; provided, however, that nothing herein contained shall be construed as depriving any riparian owner of the reasonable use of water of the stream to which the owner's land is riparian under reasonable methods of diversion and use, or as depriving any appropriator of water to which the appropriator is lawfully entitled.

This section shall be self-executing, and the Legislature may also enact laws in the furtherance of the policy in this section contained.

## Footnotes to

### Table in paragraph(b)(1) of 40 CFR 131.38 —126 PRIORITY POLLUTANTS:

- a. Criteria revised to reflect the Agency q1\* or RfD, as contained in the Integrated Risk Information System (IRIS) as of October 1, 1996. The fish tissue bioconcentration factor (BCF) from the 1980 documents was retained in each case.
- b. Criteria apply to California waters except for those waters subject to objectives in Tables III-2A and III-2B of the San Francisco Regional Water Quality Control Board's (SFRWQCB) 1986 Basin Plan that were adopted by the SFRWQCB and the State Water Resources Control Board, approved by EPA, and which continue to apply. For copper and nickel, criteria apply to California waters except for waters south of Dumbarton Bridge in San Francisco Bay that are subject to the objectives in the SFRWQCB's Basin Plan as amended by SFRWQCB Resolution R2-2002-0061, dated May 22, 2002, and approved by the State Water Resources Control Board. EPA approved the aquatic life site-specific objectives on January 21, 2003. The copper and nickel aquatic life site-specific objectives contained in the amended Basin Plan apply instead.
- c. Criteria are based on carcinogenicity of 10 (-6) risk.
- d. Criteria Maximum Concentration (CMC) equals the highest concentration of a pollutant to which aquatic life can be exposed for a short period of time without deleterious effects. Criteria Continuous Concentration (CCC) equals the highest concentration of a pollutant to which aquatic life can be exposed for an extended period of time (4 days) without deleterious effects. ug/L equals micrograms per liter.
- e. Freshwater aquatic life criteria for metals are expressed as a function of total hardness (mg/L) in the water body. The equations are provided in matrix at paragraph (b)(2) of this section. Values displayed above in the matrix correspond to a total hardness of 100 mg/l.
- f. Freshwater aquatic life criteria for pentachlorophenol are expressed as a function of pH, and are calculated as follows: Values displayed above in the matrix correspond to a pH of 7.8.  $CMC = \exp(1.005(pH) - 4.869)$ .  $CCC = \exp(1.005(pH) - 5.134)$ .
- g. This criterion is based on 304(a) aquatic life criterion issued in 1980, and was issued in one of the following documents: Aldrin/Dieldrin (EPA 440/5-80-019), Chlordane (EPA 440/5-80-027), DDT (EPA 440/5-80-038), Endosulfan (EPA 440/5-80-046), Endrin (EPA 440/5-80-047), Heptachlor (440/5-80-052), Hexachlorocyclohexane (EPA 440/5-80-054), Silver (EPA 440/5-80-071). The Minimum Data Requirements and derivation procedures were different in the 1980 Guidelines than in the 1985 Guidelines. For example, a "CMC" derived using the 1980 Guidelines was derived to be used as an instantaneous maximum. If assessment is to be done using an averaging period, the values given should be divided by 2 to obtain a value that is more comparable to a CMC derived using the 1985 Guidelines.
- h. These totals simply sum the criteria in each column. For aquatic life, there are 23 priority toxic pollutants with some type of freshwater or saltwater, acute or chronic criteria. For human health, there are 92 priority toxic pollutants with either "water + organism" or "organism only" criteria. Note that these totals count chromium as one pollutant even though EPA has developed criteria based on two valence states. In the matrix, EPA has assigned numbers 5a and 5b to the criteria for chromium to reflect the fact that the list of 126 priority pollutants includes only a single listing for chromium.
- i. Criteria for these metals are expressed as a function of the water-effect ratio, WER, as defined in paragraph (c) of this section.  $CMC = \text{column B1 or C1 value} \times WER$ ;  $CCC = \text{column B2 or C2 value} \times WER$ .
- j. No criterion for protection of human health from consumption of aquatic organisms (excluding water) was presented in the 1980 criteria document or in the 1986 Quality Criteria for Water. Nevertheless, sufficient information was presented in the 1980 document to allow a calculation of a criterion, even though the results of such a calculation were not shown in the document.

k. The CWA 304(a) criterion for asbestos is the MCL.

l. [Reserved]

m. These freshwater and saltwater criteria for metals are expressed in terms of the dissolved fraction of the metal in the water column. Criterion values were calculated by using EPA's Clean Water Act 304(a) guidance values (described in the total recoverable fraction) and then applying the conversion factors in §131.36(b)(1) and (2).

n. EPA is not promulgating human health criteria for these contaminants. However, permit authorities should address these contaminants in NPDES permit actions using the State's existing narrative criteria for toxics.

o. These criteria were promulgated for specific waters in California in the National Toxics Rule ("NTR"), at §131.36. The specific waters to which the NTR criteria apply include: Waters of the State defined as bays or estuaries and waters of the State defined as inland, i.e., all surface waters of the State not ocean waters. These waters specifically include the San Francisco Bay upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta. This section does not apply instead of the NTR for this criterion.

p. A criterion of 20 ug/l was promulgated for specific waters in California in the NTR and was promulgated in the total recoverable form. The specific waters to which the NTR criterion applies include: Waters of the San Francisco Bay upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta; and waters of Salt Slough, Mud Slough (north) and the San Joaquin River, Sack Dam to the mouth of the Merced River. This section does not apply instead of the NTR for this criterion. The State of California adopted and EPA approved a site specific criterion for the San Joaquin River, mouth of Merced to Vernalis; therefore, this section does not apply to these waters.

q. This criterion is expressed in the total recoverable form. This criterion was promulgated for specific waters in California in the NTR and was promulgated in the total recoverable form. The specific waters to which the NTR criterion applies include: Waters of the San Francisco Bay upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta; and waters of Salt Slough, Mud Slough (north) and the San Joaquin River, Sack Dam to Vernalis. This criterion does not apply instead of the NTR for these waters. This criterion applies to additional waters of the United States in the State of California pursuant to 40 CFR 131.38(c). The State of California adopted and EPA approved a site-specific criterion for the Grassland Water District, San Luis National Wildlife Refuge, and the Los Banos State Wildlife Refuge; therefore, this criterion does not apply to these waters.

r. These criteria were promulgated for specific waters in California in the NTR. The specific waters to which the NTR criteria apply include: Waters of the State defined as bays or estuaries including the San Francisco Bay upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta. This section does not apply instead of the NTR for these criteria.

s. These criteria were promulgated for specific waters in California in the NTR. The specific waters to which the NTR criteria apply include: Waters of the Sacramento-San Joaquin Delta and waters of the State defined as inland ( i.e., all surface waters of the State not bays or estuaries or ocean) that include a MUN use designation. This section does not apply instead of the NTR for these criteria.

t. These criteria were promulgated for specific waters in California in the NTR. The specific waters to which the NTR criteria apply include: Waters of the State defined as bays and estuaries including San Francisco Bay upstream to and including Suisun Bay and the Sacramento-San Joaquin Delta; and waters of the State defined as inland (i.e., all surface waters of the State not bays or estuaries or ocean) without a MUN use designation. This section does not apply instead of the NTR for these criteria.

u. PCBs are a class of chemicals which include aroclors 1242, 1254, 1221, 1232, 1248, 1260, and 1016, CAS numbers 53469219, 11097691, 11104282, 11141165, 12672296, 11096825, and 12674112, respectively. The aquatic life criteria apply to the sum of this set of seven aroclors.

- v. This criterion applies to total PCBs, e.g., the sum of all congener or isomer or homolog or aroclor analyses.
- w. This criterion has been recalculated pursuant to the 1995 Updates: Water Quality Criteria Documents for the Protection of Aquatic Life in Ambient Water, Office of Water, EPA-820-B-96-001, September 1996. See also Great Lakes Water Quality Initiative Criteria Documents for the Protection of Aquatic Life in Ambient Water, Office of Water, EPA-80-B-95-004, March 1995.
- x. The State of California has adopted and EPA has approved site specific criteria for the Sacramento River (and tributaries) above Hamilton City; therefore, these criteria do not apply to these waters.

**40 CFR 131.38 Editorial Note:** At 66 FR 9961, Feb. 13, 2001, §131.38 was amended in the table to paragraph (b)(1) under the column heading for "B Freshwater" by revising the column headings for "Criterion Maximum Concentration" and "Criterion Continuous Concentration"; under the column heading for "C Saltwater" by revising the column headings for "Criterion Maximum Concentration" and "Criterion Continuous Concentration"; and by revising entries "23." and "67.", effective Feb. 13, 2001. However, this is a photographed table and the amendments could not be incorporated into the text. For the convenience of the user, the amended text is set forth as follows:

1) § 131.38 Establishment of Numeric Criteria for priority toxic pollutants for the State of California.

(b)(1) \* \* \*

| A                               |               | B<br>Freshwater  |  | C<br>Saltwater   |  | D<br>Human Health<br>(10 <sup>-6</sup> risk for carcinogens)<br>For consumption of: |                                   |

Attachment C – (Not applicable)

Attachment D – Standard Provisions

## **I. Standard Provisions – Permit Compliance**

### **A. Duty to Comply**

1. The Discharger must comply with all of the conditions of this WDR. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code (CWC) and is grounds for enforcement action, for permit termination, revocation and reissuance, or denial of a permit renewal application [40 CFR §122.41(a)].
2. The Discharger shall comply with effluent standards or prohibitions established under section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions, even if this WDR has not been modified to incorporate the requirement [40 CFR §122.41(a)(1)].

### **B. Need to Halt or Reduce Activity Not a Defense**

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this WDR [40 CFR §122.41(c)].

### **C. Duty to Mitigate**

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this WDR that has a reasonable likelihood of adversely affecting human health or the environment [40 CFR §122.41(d)].

### **D. Proper Operation and Maintenance**

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this WDR. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this WDR [40 CFR §122.41(e)].

### **E. Property Rights**

1. This WDR does not convey any property rights of any sort or any exclusive privileges [40 CFR §122.41(g)].

2. The issuance of this WDR does not authorize any injury to persons or property or invasion of other private rights, or any infringement of State or local law or regulations [40 CFR §122.5(c)].

## **F. Inspection and Entry**

The Discharger shall allow the Regional Water Quality Control Board (Regional Board), California State Water Resources Control Board (State Board), United States Environmental Protection Agency (USEPA), and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to [40 CFR §122.41(i)] [CWC 13383(c)]:

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this WDR [40 CFR §122.41(i)(1)];
2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this WDR [40 CFR §122.41(i)(2)];
3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this WDR [40 CFR §122.41(i)(3)];
4. Sample or monitor, at reasonable times, for the purposes of assuring WDR compliance or as otherwise authorized by the CWA or the CWC, any substances or parameters at any location [40 CFR §122.41(i)(4)].

## **G. Bypass**

1. Definitions
  - a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility [40 CFR §122.41(m)(1)(i)].
  - b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production [40 CFR §122.41(m)(1)(ii)].
2. Bypass not exceeding limitations – The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3 and I.G.5 below [40 CFR §122.41(m)(2)].

3. Prohibition of bypass – Bypass is prohibited, and the Regional Board may take enforcement action against a Discharger for bypass, unless [40 CFR §122.41(m)(4)(i)]:
  - a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage [40 CFR §122.41(m)(4)(A)];
  - b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance [40 CFR §122.41(m)(4)(B)]; and
  - c. The Discharger submitted notice to the Regional Board as required under Standard Provision – Permit Compliance I.G.5 below [40 CFR §122.41(m)(4)(C)].
4. The Regional Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Board determines that it will meet the three conditions listed in Standard Provisions – Permit Compliance I.G.3 above [40 CFR §122.41(m)(4)(ii)].
5. Notice
  - a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass [40 CFR §122.41(m)(3)(i)].
  - b. Unanticipated bypass. The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below [40 CFR §122.41(m)(3)(ii)].

#### H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation [40 CFR §122.41(n)(1)].

1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of paragraph H.2 of this section are met. No determination made during administrative review of claims that noncompliance was caused by upset, and before an action for

noncompliance, is final administrative action subject to judicial review [40 CFR §122.41(n)(2)].

2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that [40 CFR §122.41(n)(3)]:
  - a. An upset occurred and that the Discharger can identify the cause(s) of the upset [40 CFR §122.41(n)(3)(i)];
  - b. The permitted facility was, at the time, being properly operated [40 CFR §122.41(n)(3)(i)];
  - c. The Discharger submitted notice of the upset as required in Standard Provisions – Reporting V.E.2.b [40 CFR §122.41(n)(3)(iii)]; and
  - d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above [40 CFR §122.41(n)(3)(iv)].
3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof [40 CFR §122.41(n)(4)].

## **II. Standard Provisions – Permit Action**

### **A. General**

This WDR may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any WDR condition [40 CFR §122.41(f)].

If any toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under section 307(a) of the CWA for a toxic pollutant which is present in the discharge, and that standard or prohibition is more stringent than any limitation on the pollutant in this WDR, this WDR shall be modified or revoked and reissued to conform to the toxic effluent standard or prohibition and the Discharger so notified.

### **B. Duty to Reapply**

If the Discharger wishes to continue an activity regulated by this WDR after the expiration date of this WDR, the Discharger must apply for and obtain a new permit [40 CFR §122.41(b)] or submit a new NOI for re-enrollment.

### **C. Transfers**

This Order is not transferable to any person because the Regional Board is required to modify or revoke and reissue this Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the CWC [40 CFR §122.41(l)(3)] [40 CFR §122.61]. A new owner or operator shall submit an NOI application to enroll in this WDR and the previous owner or operator shall submit a NOT.

### **D. Severability**

The provisions of this WDR are severable and if any provisions of this WDR or the application of any provisions of this WDR to any circumstance is held invalid, the applications of such provision to other circumstances and the remainder of this WDR shall not be affected thereby.

### **E. Pollution, Contamination, or Nuisance [CWC §13050]**

Neither the treatment nor the discharge shall create a condition of pollution, contamination or nuisance.

## **III. Standard Provisions – Monitoring**

- A.** Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity [40 CFR §122.41(j)(1)].
- B.** Monitoring results must be conducted according to test procedures under 40 CFR section 136 or, in the case of sludge use or disposal, approved under 40 CFR section 136 unless otherwise specified in 40 CFR section 503 unless other test procedures have been specified in this WDR [40 CFR §122.41(j)(4)] [40 CFR §122.44(i)(1)(iv)].

## **IV. Standard Provisions – Records**

- A.** Except for records of monitoring information required by this WDR related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by 40 CFR section 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this WDR, and records of all data used to complete the application for this WDR, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Board Executive Officer at any time [40 CFR §122.41(j)(2)].
- B.** Records of monitoring information shall include:
  - 1. The date, exact place, and time of sampling or measurements [40 CFR §122.41(j)(3)(i)];

2. The individual(s) who performed the sampling or measurements [40 CFR §122.41(j)(3)(ii)];
  3. The date(s) analyses were performed [40 CFR §122.41(j)(3)(iii)];
  4. The individual(s) who performed the analyses [40 CFR §122.41(j)(3)(iv)];
  5. The analytical techniques or methods used [40 CFR §122.41(j)(3)(v)]; and
  6. The results of such analyses [40 CFR §122.41(j)(3)(vi)].
- C. Claims of confidentiality for the following information will be denied [40 CFR §122.7(b)]:
1. The name and address of any permit applicant or Discharger [40 CFR §122.7(b)(1)]; and
  2. Permit applications and attachments, permits and effluent data [40 CFR §122.7(b)(2)].

## **V. Standard Provisions – Reporting**

### **A. Duty to Provide Information**

The Discharger shall furnish to the Regional Board, State Board, or USEPA within a reasonable time, any information which the Regional Board, State Board, or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this WDR or to determine compliance with this WDR. Upon request, the Discharger shall also furnish to the Regional Board, State Board, or USEPA copies of records required to be kept by this WDR [40 CFR §122.41(h)] [CWC 13267].

### **B. Signatory and Certification Requirements**

1. All applications, reports, or information submitted to the Regional Board, State Board, and/or USEPA shall be signed and certified in accordance with paragraph (B.2) and (B.3) of this provision [40 CFR §122.41(k)].
2. All permit applications shall be signed as follows:

- a. For a corporation: By a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (i) A president, secretary, treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy or decision making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures [40 CFR §122.22(a)(1)];
  - b. For a partnership or sole proprietorship: by a general partner or the proprietor, respectively [40 CFR §122.22(a)(2)]; or
  - c. For a municipality, State, federal, or other public agency: by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes: (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of USEPA) [40 CFR §122.22(a)(3)].
3. All reports required by this WDR and other information requested by the Regional Board, State Board, or USEPA shall be signed by a person described in paragraph (B.2) of this provision, or by a duly authorized representative of that person. A person is a duly authorized representative only if:
    - a. The authorization is made in writing by a person described in paragraph (B.2) of this provision [40 CFR §122.22(b)(1)];
    - b. The authorization specified either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company (a duly authorized representative may thus be either a named individual or any individual occupying a named position) [40 CFR §122.22(b)(2)]; and

- c. The written authorization is submitted to the Regional Board, State Board, or USEPA [40 CFR §122.22(b)(3)].
4. If an authorization under paragraph (B.3) of this provision is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of paragraph (B.3) of this provision must be submitted to the Regional Board, State Board or USEPA prior to or together with any reports, information, or applications, to be signed by an authorized representative [40 CFR §122.22(c)].
5. Any person signing a document under paragraph (B.2) or (B.3) of this provision shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations" [40 CFR §122.22(d)].

#### C. Monitoring Reports

1. Monitoring results shall be reported at the intervals specified in the MRP in this WDR [40 CFR §122.41(l)(4)].
2. Monitoring results must be reported on a Self-Monitoring Report (SMR) form or forms provided or specified by the Regional Board or State Board for reporting results of monitoring of sludge use or disposal practices [40 CFR §122.41(l)(4)(i)].
3. If the Discharger monitors any pollutant more frequently than required by this WDR using test procedures approved under 40 CFR section 136 or, in the case of sludge use or disposal, approved under 40 CFR section 136 unless otherwise specified in 40 CFR section 503, or as specified in this WDR, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the SMR or sludge reporting form specified by the Regional Board [40 CFR §122.41(l)(4)(ii)].
4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this WDR [40 CFR §122.41(l)(4)(iii)].

#### D. Compliance Schedules

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this WDR, shall be submitted no later than 14 days following each schedule date [40 CFR §122.41(l)(5)].

#### E. Twenty-Four Hour Reporting

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance [40 CFR §122.41(l)(6)(i)].
2. The following shall be included as information that must be reported within 24 hours under this paragraph [40 CFR §122.41(l)(6)(ii)]:
  - a. Any unanticipated bypass that exceeds any effluent limitation in this WDR [40 CFR §122.41(l)(6)(ii)(A)].
  - b. Any upset that exceeds any effluent limitation in this WDR [40 CFR §122.41(l)(6)(ii)(B)].
  - c. Violation of a maximum daily discharge limitation for any of the pollutants listed in this WDR to be reported within 24 hours [40 CFR §122.41(l)(6)(ii)(C)].
3. The Regional Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours [40 CFR §122.41(l)(6)(iii)].

#### F. Planned Changes

The Discharger shall give notice to the Regional Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when [40 CFR §122.41(l)(1)]:

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR §122.29(b) [40 CFR §122.41(l)(1)(i)]; or
2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which

are subject neither to effluent limitations in this WDR nor to notification requirements under 40 CFR section 122.42(a)(1) (see Additional Provisions—Notification Levels VII.A.1) [40 CFR §122.41(l)(1)(ii)]; or

3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan [40 CFR §122.41(l)(1)(iii)].

#### **G. Anticipated Noncompliance**

The Discharger shall give advance notice to the Regional Board or State Board of any planned changes in the permitted facility or activity that may result in noncompliance with the requirements of this WDR [40 CFR §122.41(l)(2)].

#### **H. Other Noncompliance**

The Discharger shall report all instances of noncompliance not reported under Standard Provisions – Reporting E.3, E.4, and E.5 at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E [40 CFR §122.41(l)(7)].

#### **I. Discharge Monitoring Quality Assurance (DMQA) Program [STATE WATER BOARD/USEPA 106 MOA]**

The Discharger shall conduct appropriate analyses on any sample provided by USEPA as part of the DMQA program. The results of such analyses shall be submitted to USEPA's DMQA manager.

#### **J. Other Information**

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Board, State Board, or USEPA, the Discharger shall promptly submit such facts or information [40 CFR §122.41(l)(8)].

### **VI. Standard Provisions – Enforcement**

- A. The CWA provides that any person who violates section 301, 302, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any such sections in a permit issued under section 402, or any requirement imposed in a pretreatment program approved under sections 402(a)(3) or 402(b)(8) of the Act, is subject to a civil penalty not to exceed \$25,000 per day for each violation. The CWA provides that any person who negligently violates sections 301, 302, 306, 307, 308, 318, or 405 of the Act, or any condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, or any requirement imposed in a pretreatment program approved

under section 402(a)(3) or 402(b)(8) of the Act, is subject to criminal penalties of \$2,500 to \$25,000 per day of violation, or imprisonment of not more than one (1) year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more than \$50,000 per day of violation, or by imprisonment of not more than two (2) years, or both. Any person who knowingly violates such sections, or such conditions or limitations is subject to criminal penalties of \$5,000 to \$50,000 per day of violation, or imprisonment for not more than three (3) years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than \$100,000 per day of violation, or imprisonment of not more than six (6) years, or both. Any person who knowingly violates section 301, 302, 303, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, and who knows at that time that he thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of not more than \$250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than \$500,000 or by imprisonment of not more than 30 years, or both. An organization, as defined in section 309(c)(3)(B)(iii) of the CWA, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than \$1,000,000 and can be fined up to \$2,000,000 for second or subsequent convictions [40 CFR §122.41(a)(2)] [CWC 13385 and 13387].

- B.** Any person may be assessed an administrative penalty by the Regional Board for violating CWA section 301, 302, 306, 307, 308, 318 or 405, or any permit condition or limitation implementing any of such sections in a permit issued under CWA section 402. Administrative penalties for Class I violations are not to exceed \$10,000 per violation, with the maximum amount of any Class I penalty assessed not to exceed \$25,000. Penalties for Class II violations are not to exceed \$10,000 per day for each day, during which the violation continues, with the maximum amount of any Class II penalty not to exceed \$125,000 [40 CFR §122.41(a)(3)].
- C.** The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than \$10,000, or by imprisonment for not more than two years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than \$20,000 per day of violation, or by imprisonment of not more than four years, or both [40 CFR §122.41(j)(5)].
- D.** The CWA provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this WDR, including monitoring reports or reports of compliance or noncompliance shall, upon conviction, be punished by

a fine of not more than \$10,000 per violation, or by imprisonment for not more than six months per violation, or by both [40 CFR §122.41(k)(2)].

## **VII. Additional Provisions – Notification Levels**

### **A. Non-Municipal Facilities**

Dischargers of existing manufacturing, commercial, mining, and silvicultural wastes shall notify the Regional Board as soon as they know or have reason to believe [40 CFR §122.42(a)]:

1. That any activity has occurred or will occur that would result in the discharge, on a routine or frequent basis, of any toxic pollutant that is not limited in this WDR, if that discharge will exceed the highest of the following "notification levels" [40 CFR §122.42(a)(1)]:
  - a. 100 micrograms per liter (µg/L) [40 CFR §122.42(a)(1)(i)];
  - b. 200 µg/L for acrolein and acrylonitrile; 500 µg/L for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/L) for antimony [40 CFR §122.42(a)(1)(ii)];
  - c. Five (5) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge [40 CFR §122.42(a)(1)(iii)]; or
  - d. The level established by the Regional Board in accordance with 40 CFR section 122.44(f) [40 CFR §122.42(a)(1)(iv)].
2. That any activity has occurred or will occur that would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant that is not limited in this WDR, if that discharge will exceed the highest of the following "notification levels" [40 CFR §122.42(a)(2)]:
  - a. 500 micrograms per liter (µg/L) [40 CFR §122.42(a)(2)(i)];
  - b. 1 milligram per liter (mg/L) for antimony [40 CFR §122.42(a)(2)(ii)];
  - c. Ten (10) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge [40 CFR §122.42(a)(2)(iii)]; or
  - d. The level established by the Regional Board in accordance with 40 CFR §122.44(f) [40 CFR §122.42(a)(2)(iv)].

### **B. Publicly-Owned Treatment Works (POTWs) (Not Applicable)**

## Attachment E – Monitoring and Reporting Program (MRP)

Title 40 of the Code of Federal Regulations (CFR) section 122.48 requires that all National Pollutant Discharge Elimination System (NPDES) permits specify monitoring and reporting requirements. California Water Code sections 13267 and 13383 also authorize the California Regional Water Quality Control Board (Regional Board) to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements, which implement the federal and California regulations.

### I. General Monitoring Provisions

- A. Samples and measurements taken as required herein shall be representative of the volume and nature of the monitored discharge. All samples shall be taken at the monitoring location identified in the representative sampling and analysis program. Another waste stream, body of water, or substance shall not dilute the monitored discharge. Monitoring points shall not be changed without notification to and the approval of the appropriate Regional Board.
- B. Monitoring must be conducted according to USEPA test procedures approved under 40 CFR section 136, Guidelines Establishing Test Procedures for the Analysis of Pollutants Under the Clean Water Act as amended, unless other test procedures are specified in this WDR and/or by the appropriate Regional Board.
- C. If the Discharger monitors any pollutant more frequently than required by this WDR using test procedures approved under 40 CFR section 136, or as specified in this WDR or by the appropriate Regional Board, the results of the monitoring shall be included in the calculation and reporting of the data submitted in the Discharger's Annual Report. The increased frequency of monitoring shall also be reported.
- D. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this WDR.
- E. All analyses shall be performed in a laboratory certified to perform such analyses by the California Department of Health Services or a laboratory approved by the appropriate Regional Board.
- F. All monitoring instruments and devices used by the Discharger to fulfill the monitoring program shall be properly maintained and calibrated to ensure accuracy. All flow measurement devices shall be calibrated at least once per year to ensure accuracy of the devices.
- G. Order No. R9-2008-0002 may be modified by the Regional Board and EPA to enable the discharger to participate in comprehensive regional monitoring activities conducted in the Southern California Bight during the term of this permit. The intent of regional monitoring activities is to maximize the efforts of all monitoring partners using a more cost-effective monitoring design and to best utilize the pooled scientific resources of the region. During these coordinated sampling efforts, the discharger's sampling and analytical effort may be reallocated to provide a regional assessment of the impact of the discharge of municipal wastewater to the

Southern California Bight. Anticipated modifications to the monitoring program will be coordinated so as to provide a more comprehensive picture of the ecological and statistical significance of monitoring results and to determine cumulative impacts of various pollution sources. If predictable relationships among the biological, water quality and effluent monitoring variables can be demonstrated, it may be appropriate to decrease the discharger's sampling effort. Conversely, the monitoring program may be intensified if it appears that the objectives cannot be achieved through the discharger's existing monitoring program. These changes will improve the overall effectiveness of monitoring in the Southern California Bight. Minor changes may be made without further public notice.

## **II. Monitoring Locations**

- A.** Dischargers enrolling for the first time under this WDR shall develop a representative sampling and analysis program to be used as case studies to represent the typical types of discharges occurring within their service areas. This study, to be submitted as the first annual report, will include the monitoring locations and rationale for choosing those locations.
- B.** Re-enrollees must submit a new case study defining monitoring locations and rationale for these locations, if there are new types of discharges.

## **III. Influent Monitoring Requirements (Not Applicable)**

## **IV. Effluent Monitoring Requirements**

- A.** Dischargers who are enrolling for the first time under this WDR shall develop a representative sampling and analysis program based on the discharge anticipated from the extracted groundwater activity as compared to the Effluent Limitations and Discharge Specifications established in this Permit to ensure the discharge will not violate Regional Board Discharge Prohibitions.
- B.** The Regional Board may increase monitoring requirements on a case-by-case basis. Additional monitoring for individual discharges may be required, where necessary, to show that during the term of the discharge, applicable water quality objectives will be maintained.
- C.** For certain metals, the hardness of the receiving water is required to calculate the effluent limit, therefore the Discharger shall measure the hardness of the receiving water at the same frequency as metals analysis.
- D. Treatment System Status**  
The daily status (e.g., onsite, in operation/on standby, etc.) of any treatment systems used to achieve compliance with this WDR or the Notice of Enrollment from the Regional Board shall be reported monthly.

## E. GROUNDWATER DISCHARGE MONITORING

- For discharges associated with gasoline or diesel underground or above ground storage tanks (Remediation Projects) (as determined by the Regional Board), the discharge monitoring shall be conducted as listed below. For remediation of groundwaters containing individual solvents (e.g. trichloroethylene, tetrachloroethane, etc.) not associated with fuel products, or other substances with effluent concentration limitations in Order No. R9-2008-0002, the monitoring requirements may be modified in the Notice of Enrollment to include a sampling frequency of once every two weeks for the individual compound(s) present in lieu of benzene, ethylbenzene, toluene, and xylene (collectively BTEX) monitoring requirements, provided that BTEX are not present, and the results reported monthly:

| (a) Constituent               | Units | Sample Type | Analysis Frequency    | Reporting Frequency |
|-------------------------------|-------|-------------|-----------------------|---------------------|
| Flowrate                      | gpd   | NA          | daily                 | monthly             |
| Total Nitrogen                | mg/L  | grab        | quarterly             | quarterly           |
|                               | lb/d  | "           | "                     | "                   |
| Total Phosphorus              | mg/L  | "           | "                     | "                   |
|                               | lb/d  | "           | "                     | "                   |
| Settleable Solids             | ml/L  | "           | "                     | "                   |
|                               | lb/d  | "           | "                     | "                   |
| Total Suspended Solids        | mg/L  | "           | quarterly             | quarterly           |
|                               | lb/d  | "           | "                     | "                   |

| 126 Priority Pollutants – Attachment B2 |       |             |                    |                     |
| (Excluding Above Marked Pollutants)     |       | "           | semiannually       | semiannually        |

6. For discharges associated with Sewer System Replacement, or Wastewater Treatment Plant Construction or Expansion Projects, in addition to monitoring for those Constituents listed in Monitoring Provision E, discharge monitoring shall be conducted for the following:

| Constituent             | Units     | Sample Type | Minimum Frequency Of Analysis | Reporting Frequency |
|-------------------------|-----------|-------------|-------------------------------|---------------------|
| Total Coliform          | MPN100/ml | grab        | weekly                        | Monthly             |
| Fecal Coliform          | "         | "           | "                             | "                   |
| Dissolved Oxygen        | mg/L      | "           | "                             | "                   |
| 126 Priority Pollutants | ---       | "           | semiannually                  | Semiannually        |
| – Attachment B2         |           |             |                               |                     |

#### E. RECEIVING WATER MONITORING

The discharger shall obtain a monthly upstream sample of the receiving water if the discharge is to a river or stream; or from an area unaffected by the discharge for other receiving waters, and analyze the sample for turbidity and report the results monthly. The turbidity of the receiving water is necessary to determine compliance of the effluent turbidity. The discharger shall also submit a monthly report discussing any turbidity plumes created by the discharge including a description (e.g., color, extent, duration, etc.) of any turbidity plumes.

For discharges to surf zones, in lieu of obtaining turbidity samples in unaffected areas, the discharger shall submit a monthly report describing (e.g., color, extent, duration, etc.) any turbidity plumes caused by the discharge.

The Regional Board may increase receiving water monitoring requirements on a case-by-case basis. Additional receiving water monitoring for individual discharges may be required, where necessary, to show that during the term of the discharge, applicable surface water quality objectives will be maintained.

For certain metals, the hardness of the receiving water is required to calculate the effluent limit, therefore the discharger shall measure the hardness of the receiving water at the same frequency as metals analysis.

F. ANNUAL SUMMARY OF MONITORING DATA

A summary of monitoring data for the previous year shall be submitted to the Regional Board previous to March 1<sup>st</sup> of each year. The report shall contain both tabular and graphical summaries of the previous year's data. If the duration of the discharge is six months or less, an annual summary is not required.

G. REPORT OF DISCHARGE TERMINATION

Within thirty days of the termination of the discharge, the discharger shall submit a letter to the Regional Board specifying the date the groundwater extraction waste discharge was terminated.

H. REPORTING FREQUENCY

Monitoring reports shall be submitted to the Regional Board in accordance with the following schedule:

| <u>REPORTING FREQUENCY</u> | <u>REPORT PERIOD</u>   | <u>REPORT DUE</u>                                 |
|----------------------------|--|---|
| Monthly                    | January, February<br>March, April, May<br>June, July, August<br>September, October<br>November, December | By the 30th<br>day of the<br>following<br>month*. |

\* The monthly report for January is due no later than February 28th

|              |                    |            |
|--------------|--------------------|------------|
| Quarterly    | January - March    | April 30   |
|              | April - June       | July 30    |
|              | July - September   | October 30 |
|              | October - December | January 30 |
| Semiannually | January - June     | July 30    |
|              | July - December    | January 30 |
| Annual       | January - December | March 1    |

Laboratories analyzing monitoring samples shall be certified by the Department of Health Services, in accordance with the provision of Water Code Section 13176, and must include quality assurance/quality control data with their reports.

The results of such analysis shall be reported in the annual report. Grab samples shall be collected at the applicable point of discharge (either at the storm drain or the receiving water). If a Discharger monitors the above constituents more frequently than required by this WDR, then the results of such monitoring shall be included in the calculation and reporting of the data submitted in the annual report. Separate annual reports are required for each region.

- I. The Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this WDR, and records of all data used to complete the application for this WDR, for a period of at least five years from the date of the sample, measurement, report, or application. This period may be extended by request of this Regional Board. These records shall include:
  1. The date, place, and time of site inspections, sampling, visual observation, and/or measurement;
  2. The individual(s) who performed the site inspections, sampling, visual observations, and/or measurements;
  3. The dimension, size and/or volume of vault;
  4. Flow measurements (if required) and duration of discharge;
  5. The estimated volume of discharge;
  6. The date and time of analyses;
  7. The laboratory, staff, or wholesaler who performed the analyses; and
  8. Analytical results.
- J. Toxicity Reduction Evaluation (TRE)

The enrollee shall develop a Toxicity Reduction Evaluation (TRE) workplan. The workplan shall be subject to the approval of the Regional Board and shall be modified as directed by the Regional Board. Enrollees shall submit the TRE workplan to the Regional Board upon request of the Regional Board. The TRE

workplan shall be developed no later than six months after adoption of this WDR in accordance with the following manuals:

1. Generalized Methodology for Conducting Industrial Toxicity Reduction Evaluations (EPA/600/2-88/070).
  2. Toxicity Identification Evaluation (TIE), Phase I (EPA/600/6-91/005F).
  3. Methods for Aquatic Toxicity Identification Evaluations, Phase II (EPA/600/R-92/080).
  4. Methods for Aquatic Toxicity Identification Evaluations, Phase III (EPA/600/R-92/081).
- K. If toxicity-testing results show a violation of any acute toxicity limitation identified in Discharge Specifications of this WDR, the enrollee shall:
1. Take all reasonable measures necessary to immediately minimize toxicity; and
  2. Increase the frequency of the toxicity test(s), which showed a violation, to at least two times per month until the results of at least two consecutive toxicity tests do not show violations.
- L. If the Regional Board determines that toxicity testing shows consistent violation of any acute toxicity limitation identified in Discharge Specifications of this WDR, the enrollee shall conduct a TRE that includes all reasonable steps to identify the source of toxicity. Once the source of toxicity is identified, the enrollee shall take all reasonable steps to reduce the toxicity to meet the toxicity limitations identified in Discharge Specifications of this WDR.
- M. Within 14 days of completion of the TRE, the enrollee shall submit the results of the TRE, including a summary of the findings, data generated, a list of corrective actions necessary to achieve consistent compliance with all the toxicity limitations of this WDR and to prevent recurrence of violations of those limitations, and a time schedule for implementation of such corrective actions. The corrective actions and time schedule shall be modified at the direction of the Regional Board.

## **V. Whole Effluent Toxicity Testing Requirements**

Whole effluent toxicity (WET) tests measure the aggregate toxic effect of a mixture of pollutants that may be present in a waste stream and provides information on potential toxic impacts to receiving waters from the discharge of wastes. WET tests measure the degree of response of exposed aquatic test organisms to an effluent. The WET approach provides a means of assessing compliance with the narrative toxicity water quality objective for aquatic life protection of the Basin Plan while implementing numeric criteria for toxicity.

There are two types of WET tests: acute and chronic. An acute toxicity test is conducted over a short time period and measures mortality. A chronic toxicity test is conducted over a longer period of time and may measure mortality, reproduction, and development.

This order requires that a Toxicity Reduction Evaluation (TRE) be conducted if a discharge causes or contributes to chronic toxicity in a receiving water body. This WDR requires the Discharger to periodically monitor the toxicity of its discharge and to develop a TRE Workplan if the toxicity effluent limitations are exceeded.

- VI. Land Discharge Monitoring Requirements (Not Applicable)**
- VII. Reclamation Monitoring Requirements (Not Applicable)**
- VIII. Receiving Water Monitoring Requirements – SURFACE WATER AND GROUNDWATER (Not Applicable)**
- IX. Other Monitoring Requirements (Not Applicable)**
- X. Reporting Requirements**

- A. General Monitoring and Reporting Requirements**

All reports submitted in response to this WDR shall comply with signatory requirements set forth in the Standard Provisions.

- B. Self Monitoring Reports (SMRs) to State and Regional Board**

1. At any time during the term of this permit, the State or Regional Board may notify the Discharger to electronically submit Self-Monitoring Reports (SMRs) using the State Board's California Integrated Water Quality System (CIWQS) Program Web site (<http://www.waterboards.ca.gov/ciwqs/index.html>). Until such notification is given, the Discharger shall submit hard copy SMRs. The CIWQS Web site will provide additional directions for SMR submittal in the event there will be service interruption for electronic submittal.
2. The Discharger shall submit annual monitoring results to the Regional Board by the 20th day of March for the preceding calendar year. The Discharger shall report in the SMR the results for all monitoring specified in this MRP. The Discharger shall submit annual SMRs including the results of all required monitoring using USEPA-approved test methods or other test methods specified in this WDR. If the Discharger monitors any pollutant more frequently than required by this WDR, the results of this monitoring shall be included in the calculations and reporting of the data submitted in the SMR.

3. The Discharger shall submit SMRs in accordance with the following requirements:

- a. The Discharger shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the facility is operating in compliance with interim and/or final effluent limitations. The Discharger is not required to duplicate the submittal of data that are entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format within the system, the Discharger shall electronically submit the data in a tabular format as an attachment.
- b. The Discharger shall attach a cover letter to the SMR. The information contained in the cover letter shall clearly identify violations of this WDR; discuss corrective actions taken or planned; and the proposed time schedule for corrective actions. Identified violations must include a description of the requirement that was violated and a description of the violation.
- c. SMRs must be submitted to the appropriate Regional Board, signed and certified as required by the Standard Provisions (Attachment D).

**C. Discharge Monitoring Reports (DMRs) to EPA**

When requested by USEPA, the Discharger shall also complete and submit Discharge Monitoring Reports to USEPA. The submittal date shall be specified in the request.

**D. OTHER REPORTS (NOT APPLICABLE)**

## Attachment F – Fact Sheet

As described in section III of this WDR, this Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this WDR.

### I. Permit Information

#### A. INTRODUCTION

This Order establishes a WDR regulating the discharge of groundwater extraction waste discharges to surface waters in the San Diego Region except San Diego Bay from all construction groundwater extraction, and similar waste discharges.

#### B. BACKGROUND

In 1972, the Federal Water Pollution Control Act, currently referred to as the Federal Clean Water Act (CWA), was amended to provide that the discharge of pollutants to waters of the United States from any point source is prohibited, unless the discharge is in compliance with a National Pollutant Discharge Elimination System (NPDES) permit. The federal regulations allow authorized states to issue either general permits or individual permits to regulate discharges of pollutants to waters of the United States. On January 28, 1991, the California Regional Water Quality Control Board, San Diego Region (Regional Board) issued a General Waste Discharge Requirement for Groundwater Remediation and Dewatering Wastes Discharges to Surface Waters within the San Diego Region except for San Diego Bay (Order No. 91-10). The permit was reissued two more times on June 13, 1996 (Order No. 96-41) and October 10, 2001 (Order No. 2001-96).

In accordance with Title 40, Code of Federal Regulations (CFR), the Regional Board must meet general program requirements prior to the re-issuance and adoption of a general NPDES permit. General program requirements include preparing a draft WDR, public noticing, allowing a public comment period, and conducting a public hearing. To meet these requirements, the Regional Board prepared a draft WDR. The tentative WDR was made available to interested parties and posted on the Regional Board's website on February 5, 2008 for comments. A public hearing to receive testimony from interested parties was scheduled for March 12, 2008. A public hearing notice was posted in the San Diego Union-Tribune, The Riverside Press-Enterprise, and The Orange County Register, major newspapers in the San Diego Region, on February 8, 2008. The public written comment period ended March 5, 2008 and the public oral comment period ended March 12, 2008 at the Regional Board meeting.

#### C. GENERAL CRITERIA

Extracted groundwater may contain pollutants which may be found in groundwaters as a result of decomposition of organic materials (e.g., hydrogen

sulfide), leaking underground storage tanks and fuel lines, surface spills, sewage, past use of liquid waste impoundments, or the potential presence of nutrients (phosphorus and nitrogen compounds).

The San Diego Regional Water Quality Control Board (hereinafter Regional Board) is aware that petroleum pollutant plumes exist in groundwaters in areas subject to construction groundwater extraction. In addition to construction groundwater extraction discharges, groundwater remediation projects required by cleanup and abatement orders issued by the Regional Board may require the discharge of treated groundwater. In addition to petroleum products and solvents, groundwaters may contain elevated concentrations of other pollutants that could degrade surface waters. These other pollutants may include metals, nutrients (nitrogen and phosphorus), hydrogen sulfide, solids, and other inorganic and organic compounds.

Existing and proposed discharges of groundwater extraction waste from construction groundwater extraction, foundation groundwater extraction, and groundwater cleanup projects:

- a) Result from similar operations (all involve extraction and discharge of groundwater);
- b) Are the same type of waste (all are groundwater);
- c) Require similar effluent limitations for the protection of the beneficial uses of the receiving waters;
- d) Require similar monitoring; and
- e) Are more appropriately regulated under a general permit rather than individual permits.

Order No. 2001-96, applied to all groundwater extraction waste discharges of greater than 100,000 gpd. For purposes of renewing NPDES permit No. 2001-96 (Tentative Order No. R9-2008-0002), historical monitoring data has been reviewed. Based on the data review results, lack of complaints of adverse impacts to water quality and/or beneficial uses of the receiving waters, and lack of documentation of adverse impacts to water quality and/or beneficial uses of the receiving waters, discharges of groundwater to all receiving waters within the region except discharges to San Diego Bay less than 100,000 gallons per day and where no known contamination exists, probably will not have an adverse effect on the receiving water/environment.

This WDR does not cover:

STORM WATER - Storm water runoff due to construction activities. These activities may be covered under the statewide general NPDES permit for storm water discharges associated with construction activities (CAS000002), the

statewide general NPDES permit for Storm Water Runoff Associated With Small Linear Underground/Overhead Construction Projects (CAS000005), and/or Clean Water Act (CWA) Section 401 Water Quality Certifications.

**SANITARY SEWER** - Discharges to a sanitary sewer. These discharges do not need coverage under the NPDES Program, although the agency controlling the sanitary sewer must approve discharges to its conveyance system.

**UTILITY VAULTS** - Discharges from utility vaults and underground structures. These activities may be covered under the statewide general NPDES permit for discharges from utility vaults and underground structures to surface water Order No. 2006-0008-DWQ (CAG990002).

**HYDROSTATIC/ POTABLE WATER** – Discharges from drinking water well development. These discharges are covered in Order No. R9-2002-0020 (CAG679001).

#### Notification Requirements

The purpose of this WDR is to facilitate regulation of discharges from groundwater extraction activities. To obtain coverage under this WDR, the Discharger must submit a Notice of Intent (NOI), a project map(s), an initial Monitoring Report, and first annual fee. Signing the certification on the NOI signifies that the Discharger intends to comply with the provisions and requirements of this WDR. AN NOI must be signed to be valid.

#### **D. DISCHARGE TO A MUNICIPAL SEPARATE STORM SEWER SYSTEM (MS4)**

Prior to discharging into an MS4, the Discharger shall demonstrate alternatives to discharging extracted groundwater waste into an MS4 and why it is technically or economically infeasible to implement these alternatives.

Without prior approval from the appropriate local agency with jurisdiction over the MS4, the discharger shall not discharge extracted groundwater waste under this WDR into an MS4.

Local agencies responsible for operating the MS4s may not passively receive and discharge pollutants from third parties. By providing free and open access to an MS4 that conveys discharges to waters of the U.S., the MS4 operator essentially accepts responsibility for discharges into the MS4 that it does not prohibit or control. These discharges may cause or contribute to a condition of contamination or a violation of water quality standards.

Therefore, at least 30 days prior to initiating an extracted groundwater discharge to an MS4, the Discharger shall notify and receive authorization from the appropriate local agency with jurisdiction over the MS4. This requirement encourages communication between Dischargers enrolled under this WDR and

local agencies responsible for MS4s in an effort to reduce misunderstandings and concerns over the types of discharges covered by this WDR.

#### E. DISCHARGE DESCRIPTION

Groundwaters in some urban areas are known to be contaminated with petroleum products and solvents due to underground storage tank leaks and pipeline leaks. Discharges of groundwater to receiving waters within the region will be required to comply with the effluent limitations contained in this Order and protect the beneficial uses of the receiving waters.

Regional Board staff expects that a number of the groundwater project proponents will propose discharges to surface waters which will require National Pollutant Discharge Elimination System (NPDES) permits.

Any discharge of untreated groundwater to a surface water may cause or contribute to excursions above narrative water quality objectives contained in the Ocean Plan and/or Basin Plan as a result of the potential discharge of petroleum related compounds, solvents, and metals.

Enrollees under this WDR that are in close proximity of the ocean, a bay, harbor, lagoon or estuary, may encounter saline groundwater, in which case the use of EPA Method 1638, and EPA Method 1640 (Clean Technologies) would be appropriate for the analysis of metals in saline samples.

#### FACILITY DESCRIPTIONS - TREATMENT FACILITIES AND OUTFALLS

This general NPDES permit contains effluent limitations which may require the application of 'best available treatment economically achievable' for the removal of petroleum products and organic compounds from each groundwater project proponent's discharge. The general NPDES permit will require each Enrollee to certify the adequacy of each component of treatment facilities or a contingency plan prior to initiating a discharge. Each Enrollee's certification report shall contain a requirement-by-requirement analysis, based on accepted engineering practice, of how the contingency plan or process and physical design of the facilities will ensure compliance with this Order.

Groundwater may be discharged to a variety of receiving waters, storm drains, or other conveyance systems tributary to receiving waters within the region. Because outfalls are not designed to achieve maximum initial dilution and dispersion of discharges, initial dilution factors for discharges to inland surface waters, bays, estuaries, and lagoons are conservatively assumed to equal zero.

An initial dilution factor of three is assumed for discharges to the surf zone. The initial dilution factor is based on a preliminary dilution model submitted by Professor Gerhard H. Jirka, School of Civil and Environmental Engineering, Cornell University, for a dewatering project for the international treatment facility ocean outfall near Tijuana. This particular model assumes that:

- a) Mixing of the dewatering discharge is primarily controlled by wave-induced turbulence and longshore conditions;
- b) 0.55 meter wave height with a 15 second period occurring with a 95 percent exceedance probability;
- c) A longshore velocity of 5 to 10 centimeters per second; and
- d) A near-shore beach slope of 3 percent.

The model results in an initial dilution ratio of six. Since the model does not represent topographic and wave conditions throughout the region, the initial dilution factor for discharges to surf zones was halved.

#### **F. DESCRIPTION OF WASTEWATER AND BIOSOLIDS TREATMENT OR CONTROLS (NOT APPLICABLE)**

#### **G. DISCHARGE POINTS AND RECEIVING WATERS**

Under the WDR, there may be multiple discharge points. Additional information regarding the receiving waters can be found in the completed NOI which describes the discharge and identifies the points of discharge.

The Comprehensive Water Quality Control Plan Report, San Diego Basin (9), (Basin Plan) was adopted by this Regional Board on September 8, 1994, and subsequently approved by the State Water Resource Control Board (hereinafter SWRCB) on December 13, 1994. Subsequent revisions to the Basin Plan have also been adopted by the Regional Board and approved by the SWRCB. The Basin Plan designates beneficial uses, narrative and numerical water quality objectives, and prohibitions which are applicable to the groundwater extraction waste discharges regulated under this Order.

The Basin Plan identifies the following beneficial uses of the surface waters in the San Diego Region to be protected (not all surface waters have all of the beneficial uses listed below):

- Municipal and domestic supply;
- Agricultural supply;
- Industrial service supply;
- Industrial process supply;
- Groundwater recharge;
- Freshwater replenishment;
- Navigation;
- Hydropower generation;

- Contact water recreation;
- Non-contact water recreation;
- Commercial and sport fishing;
- Warm freshwater habitat;
- Cold freshwater habitat;
- Preservation of Biological Habitats of Special Significance;
- Inland saline water habitat;
- Wildlife habitat;
- Rare, threatened, or endangered species;
- Marine habitat;
- Migration of aquatic organisms;
- Spawning, reproduction, and/or early development;
- Shellfish harvesting;
- Estuarine habitat; and
- Aquaculture

In order to protect these beneficial uses, the Basin Plan establishes water quality objectives (for bacterial, physical, chemical, and biological characteristics, and for radioactivity), general requirements for management of waste discharge to the bays/harbors, quality requirements for waste discharges (effluent water quality requirements), discharge prohibitions, and general provisions.

The SWRCB adopted a revised Water Quality Control Plan for Ocean Waters of California (Ocean Plan) on April 21, 2005. The Ocean Plan identifies the following beneficial uses of state ocean waters to be protected:

- Industrial water supply;
- Navigation;
- Aesthetic enjoyment;
- Water contact recreation;
- Non-contact water recreation;
- Fish migration;
- Mariculture;
- Marine habitat;
- Preservation and enhancement of areas of special biological significance;
- Preservation and enhancement of rare and endangered species;
- Fish spawning;
- Shellfish harvesting
- Ocean commercial and sport fishing;

The Ocean Plan establishes water quality objectives (for bacterial, physical, chemical, and biological characteristics, and for radioactivity), general requirements for management of waste discharge to the ocean, quality requirements for waste discharges (effluent water quality requirements), discharge prohibitions, and general provisions.

Beneficial uses of the bays and estuaries in the San Diego Region are similar to those of the Ocean Waters of the State. In order to protect the beneficial uses of the bays and estuaries, discharge specifications and receiving water quality limitations for some parameters, derived from the Ocean Plan, have been included in this Order for discharges to bays and estuaries (when open to the ocean and consisting of marine waters). If a lagoon or estuary is not open to the Pacific Ocean and consists of fresh water, discharges shall comply with the requirements established in this Order for discharges to inland surface waters.

This region has continuous and ephemeral rivers and streams, bays, estuaries, lagoons, and approximately 85 miles of coastline. No receiving waters covered under the terms and conditions of this Order have been designated an outstanding national resource water by the SWRCB. However, Heisler Park Ecological Reserve, located in coastal waters near the City of Laguna Beach, the San Diego-La Jolla Ecological Reserve, and the San Diego Marine Life Refuge, located in coastal waters near La Jolla, a community of the City of San Diego, have been designated an Area of Special Biological Significance (ASBS) by the SWRCB. The Water Quality Control Plan for Ocean Waters of California (Ocean Plan) contains the following prohibitions applicable to ASBSs:

"Waste shall not be discharged to areas designated as being of special biological significance. Discharges shall be located a sufficient distance from such designated areas to assure maintenance of natural water quality conditions in these areas."

Order No. R9-2008-0002 prohibits the discharge of extraction waste to the above ASBSs

#### **H. SUMMARY OF EXISTING REQUIREMENTS AND SELF-MONITORING REPORT DATA**

Order No. 2001-96, which this WDR replaces, requires the Discharger not to exceed the Effluent Limitations for a number of constituents, and to monitor and report the concentration and mass of the constituents in their discharge. Significant changes occurred in the Effluent Limitation requirements for some constituents. Effluent Limitations under Order No. 2001-96 were developed using the CTR, while the SIP was used for this WDR.

##### **I. Compliance Summary (Not Applicable)**

##### **J. Planned Changes (Not Applicable)**

#### **II. Applicable Plans, Policies, and Regulations**

The requirements contained in this WDR are based on the requirements and authorities described in this section.

## A. Legal Authorities

This WDR is issued pursuant to CWA section 402 and implementing regulations adopted by the USEPA and Chapter 5.5, Division 7 of the California Water Code (CWC). It shall serve as an NPDES permit for point source discharges from groundwater extraction waste discharges to surface waters. This WDR also serves as Waste Discharge Requirements (WDRs) pursuant to Article 4, Chapter 4 of the CWC for discharges that are not subject to regulation under CWA section 402.

States may request authority to issue general NPDES permits pursuant to 40 CFR section 122.28. On June 8, 1989, the State Board submitted an application to the USEPA requesting revisions to its NPDES Program in accordance with 40 CFR 122.28, 123.62, and 403.10. The application included a request to add general permit authority to its approved NPDES Program. On September 22, 1989, the USEPA, Region 9, approved the State Board's request and granted authorization for the State to issue general NPDES permits.

## B. California Environmental Quality Act (CEQA)

This action to adopt a NPDES permit is exempt from the provisions of CEQA (Public Resources Code section 21100, et seq.) in accordance with CWC section 13389 for the following reasons: 1) A Discharger cannot obtain coverage under this WDR if pollutants in the discharge, cause, contribute, or have the reasonable potential to cause or contribute to a water quality standards violation; 2) The permit requires Dischargers to monitor and report the discharge to ensure the Dischargers will not cause a violation; and 3) The Regional Board's granting of the exceptions does not have the potential for causing significant adverse environmental effects. See California Code of Regulations, Title 14, section 15061(b)(3).

## C. State and Federal Regulations, Policies, and Plans

### 1. Water Quality Control Plan

On September 8, 1994, the Regional Board adopted a Water Quality Control Plan for the San Diego Region (hereinafter Basin Plan), that designates beneficial uses, establishes water quality objectives, and contains implementation programs and policies to achieve those objectives for all waters addressed through the plan. In addition, State Board Resolution No. 88-63 requires that, with certain exceptions, the Regional Board assigns the municipal and domestic supply use to water bodies that do not have beneficial uses listed in the Basin Plans.

### 2. National Toxics Rule (NTR) and California Toxics Rule (CTR)

USEPA adopted the NTR on December 22, 1992, which was amended on May 4, 1995, and November 9, 1999, and the CTR on May 18, 2000, which was amended on February 13, 2001. These rules include water quality criteria for priority pollutants and are applicable to this discharge.

3. **State Implementation Policy (SIP)**

On March 2, 2000, the State Board adopted the SIP, which became effective on April 28, 2000, with respect to the priority pollutant criteria promulgated for California by the USEPA through the NTR and to the priority pollutant objectives established by the Regional Boards in their basin plans, with the exception of the provision on alternate test procedures for individual discharges that have been approved by USEPA Regional Administrator. The alternate test procedures provision was effective on May 22, 2000. The SIP became effective on May 18, 2000, with respect to the priority pollutant criteria promulgated by the USEPA through the CTR. The State Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. The SIP includes procedures for determining the need for and calculating Water Quality-Based Effluent Limitations (WQBELs), and requires Dischargers to submit data sufficient to do so. The State Board adopted amendments to the SIP on February 24, 2005, that became effective on July 13, 2005. The SIP establishes implementation provisions for priority pollutant criteria and objectives and provisions for chronic toxicity control. Requirements of this WDR implement the SIP.

4. **Antidegradation Policy**

Section 131.12 of 40 CFR requires that State water quality standards include an antidegradation policy consistent with the federal policy. The State Board established California's antidegradation policy in State Board Resolution No. 68-16, which incorporates the requirements of the federal antidegradation policy where applicable. Resolution No. 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. As discussed in detail in this Fact Sheet, the permitted discharge shall be consistent with the antidegradation provision of 40 CFR section 131.12 and State Board Resolution No. 68-16.

5. **Anti-Backsliding Requirements**

Sections 402(o)(2) and 303(d)(4) of the CWA and 40 CFR section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit must be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed. All effluent limitations in the WDR are at least as stringent as the effluent limitations in the previous Order unless specified.

6. **Monitoring and Reporting Requirements**

Section 122.48 of 40 CFR requires that all NPDES permits specify requirements for recording and reporting monitoring results. Sections 13267 and 13383 of the CWC authorize the Regional Boards to require technical and monitoring reports. The MRP establishes monitoring and reporting requirements to implement Federal and State requirements. This MRP is provided in Attachment E.

#### **D. Impaired Water Bodies on CWA 303(d) List**

The federal Clean Water Act requires States to identify and make a list of surface water bodies that are polluted. These water bodies, referred to in law as "water quality limited segments," do not meet water quality standards even after discharges of wastes from point sources have been treated by the minimum required levels of pollution control technology. Wastewater treatment plants, a city's storm drain system, or a boat yard, are a few examples of point sources that discharge wastes to surface waters. States are required to compile the water bodies into a list, referred to as the "Clean Water Act Section 303(d) List of Water Quality Limited Segments" (303(d) List). States must also prioritize the water bodies on the list and develop action plans, called total maximum daily loads (TMDLs) to improve the water quality.

The State Board updated the 2004-2006 303(d) List for California on October 25, 2006, and EPA approved it on November 30, 2006.

There are approximately 100 impaired water bodies on the 303(d) List in the San Diego Region. Most TMDLs for water bodies within the San Diego Region are under development or have not been started. However, four TMDLs for the San Diego Region need only State Board approval to be complete, and three are already complete. Of the three completed TMDLs, two impact the water quality of San Diego Bay and the third impacts the water quality of Rainbow Creek.

#### **E. Other Plans, Policies and Regulations**

##### **Ocean Plan**

The State Board adopted the Water Quality Control Plan for Ocean Waters of California (Ocean Plan) in 2005, it was approved by USEPA, and became effective on February 14, 2006. The Ocean Plan identifies the following beneficial uses of state ocean waters to be protected:

- a. Industrial water supply;
- b. Navigation;
- c. Aesthetic enjoyment;
- d. Water contact recreation;
- e. Non-contact water recreation;
- f. Ocean commercial and sport fishing;
- g. Mariculture;
- h. Preservation and enhancement of Areas of Special Biological Significance;
- i. Preservation and enhancement of rare and endangered species;
- j. Marine habitat;
- k. Fish migration;
- l. Fish spawning; and
- m. Shellfish harvesting.

In order to protect the above beneficial uses, the Ocean Plan establishes water quality objectives (for bacteriological, physical, chemical, and biological characteristics, and for radioactivity), general requirements for management of waste discharged to the ocean, quality requirements for waste discharges (effluent quality requirements), discharge prohibitions, and general provisions.

Limits derived from the Ocean Plan have been included in this WDR to protect beneficial uses of enclosed bays and estuaries because their beneficial uses are similar to those of the ocean waters of the State.

#### F. BASIS FOR WASTE DISCHARGE REQUIREMENTS

Section 402 of the federal Clean Water Act (CWA) gives the U.S. EPA the authority to issue NPDES permits for discharges into navigable waters and to prescribe conditions for such permits necessary to carry out the provisions of the CWA. In California, EPA has delegated this authority to the State of California.

The discharge of extracted groundwater threatens to cause or contribute to excursions above narrative water quality objectives as a result of the discharge of petroleum related compounds, metals, and organics. On May 26, 1989, the U.S. EPA enacted revisions to 40 CFR 122 (NPDES regulations). When a proposed discharge of a compound or chemical threatens to cause or contribute to an excursion above a State narrative water quality standard and a numeric water quality standard for the specific chemical has not been established, the NPDES revisions require the Regional Board to:

- a) Establish an effluent limitation using a proposed State water quality objective or standard or an explicit State policy or regulation interpreting its narrative water quality objective which will protect and maintain water quality and designated beneficial uses of the receiving water;
- b) Establish effluent limitations on a case-by-case basis, using EPA's water quality criteria published under 307(a) of the Federal Clean Water Act; or
- c) Establish effluent limitations on an indicator parameter for the pollutants of concern (State Board memorandum dated November 3, 1989).

Groundwater pollutant plumes are often complex mixtures of hundreds of petroleum related compounds (e.g. gasoline contains over 200 chemical compounds) which makes complete chemical analyses very expensive and sometimes impracticable or impossible due to sample matrix interferences, constituent masking, or the lack of standard analytical techniques. Since water quality criteria for many of the petroleum hydrocarbon compounds have not been proposed or established by the State or EPA, the permit will require monitoring groundwater discharged using "indicator constituents" for the detection and evaluation of complex mixtures of petroleum related compounds such as gasoline and solvents. The indicator constituents used for evaluating compliance with the narrative water quality criteria in the permit for discharges of gasoline related products are benzene, ethylbenzene, toluene, xylene, and total petroleum

hydrocarbons, since it is believed that fuels have been adequately studied to justify limiting the analysis to these compounds.

On June 8, 1989, the SWRCB submitted an application to the U.S. EPA requesting revisions to its NPDES program in accordance with 40 CFR 123.62 and 403.10. The application included a request to add general permit authority to its approved NPDES program. States may request authority to issue general permits pursuant to 40 CFR 122.28. On September 22, 1989, the EPA, Region IX, approved the SWRCB's request and granted authorization for the State's issuance of general NPDES permits.

40 CFR 122.28 provides for the issuance of general permits to regulate discharges of waste which result from similar operations, are the same type of waste, require the same effluent limitations, require similar monitoring, and are more appropriately regulated under a general permit rather than individual permits.

In order to protect the beneficial uses of groundwaters and receiving waters in the region as a result of escalating numbers of groundwater extraction waste discharges, new permanent groundwater extraction waste discharges will be considered for enrollment on a case-by-case basis. The regulation of discharges from new permanent groundwater extraction operations to receiving waters will reduce the waste of groundwater as intended by Article X of the California Constitution and Section 275 of the California Water Code, and may reduce the potential number of new permanent discharges as intended by the federal Clean Water Act (Section 101(a)(1)) and the Water Quality Control Policy for Enclosed Bays and Estuaries of California.

The practice of permanent groundwater extraction for the purpose of protecting underground parking or other structures and the subsequent discharge of the groundwaters, without using the groundwaters to the "fullest extent to which they are capable," as required by the California Constitution, is an unreasonable use of such waters, if the waters have designated beneficial uses. Article X, Section 2, of the California Constitution requires that "water resources of the State be put to beneficial use to the fullest extent of which they are capable and that the waste or unreasonable use or unreasonable method of use of water be prevented, and that the conservation of such waters is to be exercised with a view to the reasonable and beneficial use thereof in the interest of the people and for the public welfare." Water Code Section 275 states, "The department and board shall take all appropriate proceedings or actions before executive, legislative, or judicial agencies to prevent waste, unreasonable use, unreasonable method of use, or unreasonable method of diversion of water in this state."

On March 2, 2000, the SWRCB, in Resolution No. 2000-15, adopted a Policy for Implementation of Toxic Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California (Policy). The Policy implements the provisions promulgated by the U.S. Environmental Protection Agency (U.S. EPA) in the California Toxics Rule (CTR). Criteria for 126 priority pollutants are established by the CTR.

U.S. EPA promulgated this rule to fill a gap in California water quality standards that was created in 1994 when a State court overturned the State's water quality control plans containing water quality criteria for priority toxic pollutants. The Federal criteria are legally applicable in the State of California for inland surface waters, enclosed bays and estuaries for all purposes and programs under the Clean Water Act.

The Policy was effective on April 28, 2000, with respect to the priority pollutant criteria promulgated for California by the U.S. EPA through the National Toxics Rule (NTR) and to the priority pollutant objectives established by Regional Boards in their water quality control plans (basin plans).

The U.S. EPA promulgated the final California Toxic Rule (CTR) on May 18, 2000, as required by Section 303(c)(2)(B) of the federal Clean Water Act. The CTR regulations, codified in 40 CFR 131.38, establish numeric criteria for water quality standards for priority toxic pollutants for the State of California.

The Policy establishes:

- a) implementation provisions for priority pollutant criteria promulgated by the U.S. EPA through the National Toxic Rule (NTR) and the CTR, and for priority pollutant objectives established in the Basin Plan;
- b) monitoring requirements for 2,3,7,8-TCDD (tetrachlorodibenzo-p-dioxin) equivalents; and
- c) Chronic toxicity control provisions.

Pursuant to Section 5.3 of the Policy, the Regional Board may, after compliance with the California Environmental Quality Act (CEQA), allow short-term or seasonal exceptions from meeting the priority pollutant criteria/objectives if determined to be necessary to implement control measures either:

- a) For resource or pest management (i.e., vector or weed control, pest eradication, or fishery management) conducted by public entities to fulfill statutory requirements, including, but not limited for, those in the California Fish and Game, Food and Agriculture, Health and Safety, and Harbors and Navigation codes; or
- b) Regarding drinking water conducted to fulfill statutory requirements under the federal Safe Drinking Water Act or the California Health and Safety Code. Such categorical exceptions may also be granted for draining municipal storm water conveyances for cleaning or maintenance, or for draining water treatment facilities for cleaning or maintenance.

Section 5.3 of the Policy states that, where site-specific conditions in individual water bodies or watersheds differ sufficiently from statewide conditions and those differences cannot be addressed through other provisions of this policy the SWRCB

may, in compliance with the California Environmental Quality Act (CEQA), subsequent to a public hearing, and with the concurrence of the U.S. Environmental Protection Agency, grant an exception to meeting a priority pollutant criterion/objective or any other provision of this Policy where the State Board determines:

- a) The exception will not compromise protection of enclosed bay, estuarine, and inland surface waters for beneficial uses; and
- b) The public interest will be served.

Section 402(a)(1) of the Clean Water Act authorizes the issuance of best available technology effluent limitations in NPDES permits using best professional judgement. Using best professional judgement, best available technology economically achievable for the removal of volatile and semi-volatile organic compounds, and analytical practical quantitation levels is the basis for effluent limitations, for these compounds, in the Discharge Specifications of the Order. Thus, best available technology economically achievable for the removal of organic compounds is the basis for effluent limitations for xylene and other volatile hydrocarbons, and base/neutral compounds (not included in 40 CFR 131.38).

Water Quality Based Effluent Discharge Specifications (limits) were established for this groundwater extraction waste discharge permit, using 40 CFR 131.38 (Water Quality Standards; Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California), and the State's Implementation Policy. Water Quality Based Effluent Discharge Limits do not apply to discharges of extracted groundwater to the surf zone.

In general, there are two accepted technologies in use for the removal of synthetic organic compounds from water: aeration and adsorption. Removal efficiencies of volatile organic compounds through aeration processes can be estimated based on each compound's Henry's Law Coefficient (increasing coefficients indicate increasing volatility). Benzene is relatively soluble in water when compared to other fuel constituents and solvents. Any compound which has a Henry's Law coefficient greater than that of benzene will theoretically volatilize faster than benzene (assuming molecular or chemical interactions are nonexistent or minimized). Most of the compounds associated with fuel products and solvents commonly found in contaminated groundwater have Henry's Law Coefficients greater than that of benzene and will be efficiently removed through aeration if benzene is removed. The general consensus in the literature is that a 99 percent removal efficiency of volatile compounds with similar concentrations may be achieved through aeration processes. Based on best professional judgement, if benzene is removed from groundwater to levels approaching detection limits (practical quantitation level), other volatile organic compounds of concern (e.g., tetrachloroethylene, trichloroethylene, carbon tetrachloride, etc.) will be removed from the discharged groundwater as well.

Organic compounds which are not removed from groundwaters through aeration processes may be removed through adsorption processes (e.g., granular activated carbon). When properly designed and operated, most granular activated carbon systems can lower the concentration of synthetic organic contaminants to below detection limits.

In general, most synthetic organic contaminants can be removed from groundwaters using the aeration or adsorption processes or a combination thereof.

Establishing effluent limitations in the practical quantitation limit range (1 to 5  $\mu$ g/L) and monitoring requirements for BTEX as indicators of fuels, 40 CFR 136 listed volatile compounds as indicators of solvents, and base/neutral compounds as indicators of diesel product, will, based on best professional judgement, ensure that compounds of concern are not discharged in levels which will cause excursions from narrative water quality criteria or objectives.

On January 1, 1998, Senate Bill (SB) 521 was passed. SB521 adds language, applicable to leaking underground storage tanks, to the Health & Safety Code as follows: "Section 25299.37.1. No closure letter pursuant to this chapter shall be issued unless the soil or groundwater, or both, where applicable, at the site have been tested for Methyl Tertiary Butyl Ether (MTBE) and the results of that testing are known to the Regional Board." Subsequently, on February 20, 1998, the San Diego Regional Board, Site Mitigation & Cleanup Unit, issued written notification to interested parties of Mandatory MTBE Sampling For Underground Storage Tank (UST) Site Closures-Senate Bill (SB) 521. The February 20, 1998, notification specifies that "For ground water impacted sites or soil sites that may threaten ground water, both soil and ground water sampling and analysis for MTBE will be required."

The Porter-Cologne Water Quality Control Act (January 1, 2000), Section 13272.1 and Section 13285, address discharges of MTBE. The California Department of Health Services (DHS) last update (March 9, 2000) of California's Maximum Contaminant Levels (MCLs) for MTBE states the following:

As established by the DHS, the primary MCL is 13  $\mu$ g/L for MTBE and the secondary MCL is 5  $\mu$ g/L.

The Order requires that groundwater discharged to bays and estuaries must not contain pollutants in excess of applicable receiving water quality objectives contained in 40 CFR 131.38 (Water Quality Standards; Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California), or effluent limitations based on achievable concentrations using best available technology (BAT), whichever results in a lower effluent concentration. Effluent limitations based on BAT are equal to or less than the practical quantitation level. Since the assumed initial dilution factor for the discharge is zero, a discharge could not cause an excursion from numeric receiving water quality objectives for Tables 1 and 2 (Groundwater Extraction Discharges to Bays and Harbors, and Groundwater Extraction Waste Discharges to Lagoons/Estuaries), if the discharge is in compliance with the effluent limitations contained in the Order. Likewise,

discharges to the surf zone cannot cause excursions from water quality objectives based on the preceding, and assuming that the dilution factor will always be greater than three.

For discharges to inland surface waters, effluent limitations are based on the EPA water quality criteria for the protection of aquatic species, the EPA water quality criteria for the protection of human health, effluent concentrations achievable using best available technology, 40 CFR 131.38 (Water Quality Standards; Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California), or, in the cases where the receiving water is designated potable or municipal supply waters, maximum contaminant levels for municipal waters established by the California Department of Health Services. Since the assumed initial dilution factor for the discharge is zero and a mixing zone is not allowed, a discharge could not cause an excursion from numeric receiving water quality objectives if the discharge is in compliance with the effluent limitations contained in the Order.

No evidence that groundwaters in the region contain biocides, dioxins, or radiation has been found to date. However, discharges of pesticides in detectable concentrations to inland surface waters are prohibited by the Comprehensive Water Quality Control Plan Report, San Diego Basin (9) (Basin Plan), and by the Order.

In the adoption of waste discharge requirements and effluent limitations to protect the beneficial uses of waters of the State, Section 1300 et seq., of the California Water Code, authorizes the use of relevant water quality objectives or other criteria in the absence of numerical effluent concentration limitations in the Bays and Estuaries Policy.

Compliance with effluent limitations shall be determined as follows (pursuant to 40 CFR – 131.38):

- a) Dischargers shall be deemed out of compliance with an effluent limitation if the concentration of the priority pollutant in the monitoring sample is greater than the effluent limitation and greater than or equal to the reported Minimum Level (ML).
- b) Dischargers shall be required to conduct a Pollutant Minimization Program (PMP) when there is evidence (e.g., sample results reported as “Detected, but Not Quantified” (DNQ) when the effluent limitation is less than the Method Detection Limit (MDL), sample results from analytical methods more sensitive than those methods included in the permit, presence of whole effluent toxicity, health advisories for fish consumption, results of benthic or aquatic organism tissue sampling) that the priority pollutant is present in the effluent above an effluent limitation and either:
  - 1) A sample result is reported as DNQ and the effluent limitation is less than the reported ML; or

- 2) A sample result is reported as Non-Detect (ND) and the effluent limitation is less than the MDL.

When determining compliance with an Average Monthly Effluent Limitation (AMEL) and more than one sample result is available in a month, the discharger shall compute the arithmetic mean unless the data set contains one or more reported determinations of DNQ or ND. In those cases, the discharger shall compute the median in place of the arithmetic mean in accordance with the following procedure:

- a) The data set shall be ranked from low to high, reported ND determinations lowest, DNQ determinations next, followed by quantified values (if any). The order of the individual ND or DNQ determinations is unimportant.
- b) The median value of the data set shall be determined. If the data set has an odd number of data points, then the median is the middle value. If the data set has an even number of data points, then the median is the average of the two values around the middle unless one or both of the points are ND or DNQ, in which case the median value shall be the lower of the two data points where DNQ is lower than a value and ND is lower than DNQ.

If a sample result, or the arithmetic mean or median of multiple sample results, is below the reported ML, and there is evidence that the priority pollutant is present in the effluent above an effluent limitation and the discharger conducts a PMP, the discharger shall not be deemed out of compliance.

### **III. Rationale For Effluent Limitations and Discharge Specifications**

The CWA requires point source dischargers to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. Effluent limitations are based on the following principles:

- A. 40 CFR section 122.44(a) requires that permits include applicable technology-based limitations and standards;
- B. 40 CFR section 122.44(d) requires that permits include water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water. Where numeric water quality criteria have not been established, three options exist to protect water quality: 1) 40 CFR section 122.44(d) specifies that WQBELs may be established using USEPA criteria guidance under CWA section 304(a); 2) proposed state criteria or a state policy interpreting narrative criteria supplemented with other relevant information may be used; or 3) an indicator parameter may be established;

- C. Any discharge of untreated groundwater to surface water in the San Diego Region threatens to cause or contribute to excursions above narrative water quality objectives contained in the Basin Plan as a result of the potential discharge of petroleum related compounds, solvents, and metals.

On May 26, 1989, USEPA enacted revisions to NPDES program regulations (40 CFR 122). When a proposed discharge of a compound or chemical threatens to cause or contribute to an excursion above a State narrative water quality standard and a numeric water quality standard for the specific chemical has not been established, the NPDES program regulations require the Regional Board to do the following: 1) Establish effluent limitations using a proposed State water quality objective or standard, or an explicit State policy or regulation interpreting its narrative water quality objective which will protect and maintain water quality and designated beneficial uses of the receiving water; 2) Establish effluent limitations on a case-by-case basis, using USEPA's water quality criteria published under CWA section 307(a); or 3) Establish effluent limitations on an indicator parameter for the pollutants of concern; and

- D. 40 CFR section 122.44(l) requires that when a permit is renewed or reissued, effluent limitations must be at least as stringent as the effluent limitations in the previous permit. Since this permit is a renewal of a previous permit, anti-backsliding is applicable and the following pollutants are included:

|                              |                                      |
|------------------------------|--------------------------------------|
| Settleable Solids            | Phenolic Compounds (non-chlorinated) |
| Total Suspended Solids       | Chlorinated Phenolics                |
| Hydrogen Sulfide             | 1,1,2,2-tetrachlorethane (PCA)       |

| Cyanide                      |                                      |

- E. Methyl Tertiary-Butyl Ether (MTBE), is a chemical compound that is manufactured by the chemical reaction of methanol and isobutylene.

MTBE is produced in very large quantities (over 200,000 barrels per day in the U.S. in 1999) and is almost exclusively used as a fuel additive in motor gasoline. It is one of a group of chemicals commonly known as "oxygenates" because they raise the oxygen content of gasoline. At room temperature, MTBE is a volatile, flammable and colorless liquid that dissolves rather easily in water.

Because MTBE dissolves easily in water and does not "cling" to soil very well, it migrates faster and farther in the ground than other gasoline components, thus making it more likely to migrate to groundwater extraction wells. MTBE does not degrade (breakdown) easily and is difficult and costly to remove from groundwater.

On January 1, 1998, Senate Bill (SB) 521 was passed. SB521 adds language to the Health & Safety Code which is applicable to leaking underground storage tanks as follows: "Section 25299.37.1. No closure letter pursuant to this chapter shall be issued unless the soil or groundwater, or both, where applicable, at the site have been tested for Methyl Tertiary Butyl Ether (MTBE) and the results of that testing are known to the Regional Board." Subsequently, on February 20, 1998, the Regional Board, Site Mitigation & Cleanup Unit, issued written notification to interested parties of Mandatory MTBE Sampling For Underground Storage Tank (UST) Site Closures-Senate Bill (SB) 521. The February 20, 1998, notification specifies that "For ground water impacted sites or soil sites that may threaten ground water, both soil and ground water sampling and analysis for MTBE will be required."

Sections 13272.1 and Section 13285 of the CWC address discharges of MTBE. The California Department of Health Services (DHS) adopted limits for Maximum Contaminant Levels for MTBE. The Primary MCL of 13 µg/L was adopted by DHS on May 17, 2000. The Secondary MCL (for taste and odor not health affects) of 5 µg/L was adopted on January 7, 1999. The UST program uses the more conservative secondary MCL of 5 µg/L.

#### F. Discharge Prohibitions

Discharges under this WDR are required to be nontoxic. Toxicity is the adverse response of organisms to chemicals or physical agents. This prohibition is based on the Basin Plan, which require that all waters be maintained free of toxic substances in concentrations that are lethal or produce other detrimental responses in aquatic organisms. Detrimental responses include, but are not limited to, decreased growth rate and decreased reproductive success of resident or indicator species. The Basin Plan also requires waters to be free of toxic substances in concentrations that produce detrimental physiological responses in human, plant, or animal life. This objective applies regardless of whether

the toxicity is caused by a single substance or the interactive effect of multiple substances.

Mass emission rate limitations will be determined using the discharge flowrate and effluent concentration limitations specified in this WDR; therefore, the daily maximum discharge flowrate limitation for each discharge will be specified in the discharge Notice of Enrollment from the Regional Board. The discharge flowrate will be designated as the maximum discharge flowrate and the Discharger shall be prohibited from discharging in excess of the maximum discharge flowrate.

1. The discharge of groundwater to surface waters is prohibited unless authorized, exempted, or issued an individual NPDES permit by the Regional Board.
2. The discharge of wastes to areas designated by the SWRCB, and recommended by the Regional Board, as areas of special biological significance is prohibited. Discharges shall be located a sufficient distance from such designated areas to assure maintenance of natural water quality conditions in these areas.
3. The discharge of groundwater extraction waste to surface waters from permanent groundwater extraction operations in basins with designated beneficial uses of industrial, agricultural, or municipal and domestic supply are prohibited unless such extracted groundwater (not used beneficially) is used beneficially (Application Requirements, Section F.17, and F.18). If the Enrollee of such extracted groundwater wishes to discharge to surface waters, it shall be the responsibility of the Enrollee to obtain an individual NPDES Permit for the discharge.
4. The discharge of groundwater extraction waste to enclosed bays, harbors, lagoons, and estuaries, or tributaries thereto, is prohibited unless the Enrollee demonstrates to the satisfaction of the Regional Board that alternative disposal sites (e.g., surf zone) are not practicable as required in Application Requirements, Sections F.17, and F.18.
5. The discharge of groundwater extraction waste to any surface water from a groundwater extraction project after the date of completion of construction of structures requiring groundwater extraction, or from a groundwater remediation operation after the date the groundwater has been remediated to the satisfaction of the Regional Board, is prohibited.
6. The discharge of groundwater in excess of the flowrate specified in each Enrollee's Notice of Enrollment is prohibited unless the

Enrollee obtains a revised discharge Notice of Enrollment authorizing an increased flowrate.

7. No individual pesticide or combination of pesticides shall be present in the water column, sediments, or biota at concentration(s) that adversely affect beneficial uses. Pesticides shall not be present at levels which will bioaccumulate in aquatic organisms to levels which are harmful to human health, wildlife or aquatic organisms.

Water designated for use as domestic or municipal supply (MUN) (drinking water) shall not contain concentrations of pesticides in excess of the maximum contaminant levels specified in California Code of Regulations, Title 22, Table 64444-A of Section 64444 (Organic Chemicals). (See Basin Plan Chapter 3-13).

8. Compliance with the waste discharge prohibitions contained in the Basin Plan is a condition of this Order.
9. The discharge of groundwater extraction waste to a storm water conveyance system without notifying and receiving authorization from the agency having jurisdiction over the storm water conveyance system is prohibited.
10. The discharge of wastes tributary or directly to areas designated as being of special biological significance by the SWRCB is prohibited. Discharges shall be located a sufficient distance from such designated areas to assure maintenance of natural water quality conditions in these areas.

G. Technology-Based Effluent Limitations (TBELs)

1. Scope and Authority

The CWA requires that TBELs be established based on several levels of controls:

Best Practicable Treatment Control Technology (BPT) represents the average of the best performance by plants within an industrial category or subcategory. The BPT standards apply to toxic, conventional, and nonconventional pollutants.

Best Available Technology Economically Achievable (BAT) represents the best existing performance of treatment technologies that are economically achievable within an industrial point source category. The BAT standards apply to toxic and nonconventional pollutants.

Best Conventional Pollutant Control Technology (BCT) represents the control from existing industrial point sources of conventional pollutants including BOD, TSS, fecal coliform, pH, and oil and grease. The BCT standard is established after considering the "cost reasonableness" of the relationship between the cost of attaining a reduction in effluent discharge and the benefits that would result, and also the cost effectiveness of additional industrial treatment beyond BPT.

New Source Performance Standards (NSPS) represent the best available demonstrated control technology standards. The intent of NSPS guidelines is to set limitations that represent state-of-the-art treatment technology for new sources.

The CWA requires USEPA to develop Effluent Limitations, Guidelines and Standards (ELGs) representing application of BPT, BAT, BCT, and NSPS. Section 402(a)(1) of the CWA and 40 CFR section 125.3 of the NPDES regulations authorize the use of Best Professional Judgment (BPJ) to derive technology-based effluent limitations on a case-by-case basis where ELGs are not available for certain industrial categories and/or pollutants of concern. Where BPJ is used, the permit writer must consider specific factors outlined in 40 CFR section 125.3.

## 2. Applicable Technology-Based Effluent Limitations

The USEPA has not developed numeric Technology-Based effluent limitations for pollutants in discharges from groundwater extraction.

## H. Water Quality-Based Effluent Limitations (WQBELs)

### 1. Scope and Authority

As specified in 40 CFR section 122.44(d)(1)(i), permits are required to include WQBELs for pollutants (including toxicity) that are or may be discharged at levels that cause, have reasonable potential to cause, or contribute to an excursion above any state water quality standard. The process for determining reasonable potential and calculating WQBELs when necessary is intended to protect the designated uses of the receiving water as specified in the Basin Plan, achieve applicable water quality objectives and criteria contained in state plans and policies, and meet water quality criteria in the CTR and NTR.

### 2. Applicable Beneficial Uses and Water Quality Criteria and Objectives

The designated beneficial uses of surface waters throughout the State may include municipal, domestic, industrial, and agricultural supply; water contact and non-contact recreation; navigation; groundwater recharge and freshwater replenishment; hydropower generation; wildlife habitat; cold

freshwater and warm freshwater habitat; fish migration and fish spawning; marine habitat; estuarine habitat; shellfish harvesting; ocean commercial and sport fishing; areas of special biological significance; and preservation of rare and endangered species. To the extent that the Basin Plan designates additional or different beneficial uses, the Basin Plan shall apply.

### 3. Determining the Need for WQBELs

All applicable provisions of sections 301 and 402 of the CWA must be met for NPDES permits for discharges to surface waters. These provisions require controls of pollutant discharges that utilize BAT and BCT to reduce pollutant and any more stringent controls necessary to meet water quality standards.

As specified in the SIP, the Regional Board shall conduct an analysis for each priority pollutant with applicable criterion or objective to determine if a water quality-based effluent limitation is required.

Data are unavailable to conduct an analysis because a WDR as a General Permit, does not require a Report of Waste Discharge. Therefore, the discharger shall conduct an initial sample based on flow to determine the requirements.

#### Reasonable Potential Analysis (RPA)

In order to determine what to sample for and what frequency, an initial set of data is required.

If the discharger proposes to discharge less than 100,000 gallons per day, then the discharger shall initially conduct Monitoring Program A (sample for the entire constituents listed in III.D. and MTBE).

However if the discharger proposes to discharge 100,000 gallons per day or more, then the discharger shall initially conduct Monitoring Program B (sample the entire constituents listed in III.D., MTBE, and all 126 priority pollutants).

Based on the initial monitoring program if the discharge does not require treatment to meet the discharge specifications of this WDR, then the discharger will only need to conduct Monitoring Program A (if discharging less than 100,000 gallons per day) or Monitoring Program B (if discharging 100,000 gallons per day or more) once per year. This will provide data to identify reasonable potential for future effluent limits.

If the discharge will require treatment prior to discharge, then in addition to the once per year monitoring required listed above, the discharger will also monitor for all the constituents listed in the discharge specification with

effluent limits at the frequency required in the Monitoring and Reporting Program stated in Attachment E because of the reasonable potential of exceeding the effluent limits in the discharge specifications of this WDR.

If there are any contaminated sites within the radius of influence of the groundwater extraction activities, then the constituent of concern will be monitored at the frequency required in the Monitoring and Reporting Program stated in Attachment E because of the reasonable potential of exceeding the effluent limits in the discharge specifications of this WDR. If the constituent of concern is not listed in the Monitoring and Reporting Program stated in Attachment E then a monitoring and reporting frequency will be stated in the Notice of Enrollment.

Table summarizing effluent limits and monitoring

| DISCHARGE                                | EFFLUENT LIMITS | MONITORING PROGRAM   |
|--|-----------------|--|
| < 100,000                                |                 | <ul style="list-style-type: none"><li>• Program A Annual</li></ul>   |
| >= 100,000                               |                 | <ul style="list-style-type: none"><li>• Program B Annual</li></ul>   |
| Treatment                                | Yes             | <ul style="list-style-type: none"><li>• Monitoring and Reporting Program in Attachment E</li></ul>                                   |
| Contaminated Site in Radius of Influence |                 | <ul style="list-style-type: none"><li>• Monitor and Report constituent(s) of concern as stated in the Notice of Enrollment</li></ul> |

#### 4. WQBEL Calculations

The Average Monthly Effluent and Maximum Daily Effluent WQBELs were calculated using a statistical approach with the following considerations and assumptions:

No dilution credit is considered for the discharge. Therefore, the discharge must comply with the Water Quality Objective at the point of discharge.

The WQBEL based on the CTR were implemented using the procedure list in the SIP. The procedure is listed below with copper as the example.

CTR/SIP calculations - Copper Example:

Criteria for Priority Toxic Pollutant in the State of California is described in the CTR table listed in 40 CFR 131.38.

§ 131.38

40 CFR Ch. I (7-1-00 Edition)

| A                              |               | B<br>Freshwater                                  |   | C<br>Saltwater                                   |   | D<br>Human Health<br>(10 <sup>-6</sup> risk for carcinogens)<br>For consumption of: |                                   |

Saltwater criterion maximum concentration (CMC) = 4.8 µg/L

Saltwater criterion continuous concentration (CCC) = 3.1 µg/L

These criteria are expressed in terms of the dissolved fraction of the metal in the water column. [See footnote "m" to Table in paragraph (b)(1) of 40 CFR 131.38]

40 CFR 122.45(c) requires that this WDR include effluent limitations as a total recoverable concentration.

The SIP requires that if it is necessary to express a dissolved metal or selenium value as total recoverable and a site-specific translator has not yet been developed, the Regional Board shall use the applicable conversion factor from 40 CFR 131.38.

The term "Conversion Factor" (CF) represents the recommended conversion factor for converting a metal criterion expressed as the total recoverable fraction in the water column to a criterion expressed as the dissolved fraction in the water column [See note to Table 2 of Paragraph (b)(2) to 40 CFR 131.38]

Total recoverable concentration \* CF = Dissolved concentration criterion

or

Total recoverable concentration = Dissolved concentration criterion / CF

§ 131.38

40 CFR Ch. I (7-1-00 Edition)

(iv) Table 2 to paragraph (b)(2) of this section:

| Metal                | Conversion factor (CF) for freshwater acute criteria | CF for freshwater chronic criteria | CF for saltwater acute criteria | CF* for saltwater chronic criteria |
|----------------------|--|------------------------------------|---------------------------------|------------------------------------|
| Antimony .....       | ( <sup>d</sup> )                                     | ( <sup>d</sup> )                   | ( <sup>d</sup> )                | ( <sup>d</sup> )                   |
| Arsenic .....        | 1.000  | 1.000                              | 1.000                           | 1.000                              |
| Beryllium .....      | ( <sup>d</sup> )                                     | ( <sup>d</sup> )                   | ( <sup>d</sup> )                | ( <sup>d</sup> )                   |
| Cadmium .....        | *0.944   | *0.909                             | 0.994                           | 0.994                              |
| Chromium (III) ..... | 0.316  | 0.860                              | ( <sup>d</sup> )                | ( <sup>d</sup> )                   |
| Chromium (VI) .....  | 0.982  | 0.962                              | 0.993                           | 0.993                              |
| Copper .....         | 0.960  | 0.960                              | 0.83                            | 0.83                               |

CF for copper = 0.83

Total recoverable concentrations for copper:

4.8 µg/L dissolved (CMC) / 0.83 (CF) = 5.8 µg/L total recoverable for CMC

3.1 µg/L dissolved (CCC) / 0.83 (CF) = 3.7 µg/L total recoverable for CCC

Effluent variability multiplier and Coefficient of Variation (CV)

For each concentration based on an aquatic life criterion, the long-term average (LTA) is calculated by multiplying the concentration with a factor that adjusts for effluent variability. The multiplier can be found in Table 1 of the SIP. Since this is a WDR without existing data points, the number of effluent data points is less than ten; the CV shall be set equal to 0.6 per the SIP.

Table 1. Effluent Concentration Allowance (ECA)  
Multipliers for Calculating Long-Term Averages (LTAs)

| Coefficient Of Variation (CV) | Acute Multiplier                                   | Chronic Multiplier                                 |
|-------------------------------|--|--|
|                               | 99 <sup>th</sup> Percentile Occurrence Probability | 99 <sup>th</sup> Percentile Occurrence Probability |
| 0.1                           | 0.797  | 0.891  |
| 0.2                           | 0.643  | 0.797  |
| 0.3                           | 0.527  | 0.715  |
| 0.4                           | 0.440  | 0.643  |
| 0.5                           | 0.373  | 0.581  |
| 0.6                           | 0.321  | 0.527  |

Therefore, from Table 1 of the SIP, the effluent variability multiplier will be as follows:

Acute Multiplier = 0.321

Chronic Multiplier = 0.527

The long-term average (LTA) is calculated by multiplying the total recoverable concentrations for copper with the acute and chronic multipliers:

$$\begin{aligned}\text{LTA acute} &= 5.8 \mu\text{g/L} * 0.321 = 1.9 \mu\text{g/L} \\ \text{LTA chronic} &= 3.7 \mu\text{g/L} * 0.527 = 2.0 \mu\text{g/L}\end{aligned}$$

The MDEL and AMEL will be based on the most limiting of the acute and chronic LTA, in the case for copper it will be LTA acute of 1.9  $\mu\text{g/L}$ .

Water quality-based effluent limits are calculated by multiplying the most limiting LTA with a factor (multiplier) that adjusts for the averaging periods and exceedance frequencies of the criteria and the effluent limitations. The multiplier can be found in Table 2 of the SIP. Since this is a WDR without existing data points, the CV will be set equal to 0.6 and since sampling frequency is four times a month or less, n shall be set equal to 4 per SIP (n=4).

Table 2. Long-Term Average (LTA) Multipliers for Calculating Effluent Limitations

| Coefficient of Variation | MDEL Multiplier                                    | AMEL Multiplier                                    |       |        | MDEL/AMEL Multiplier  |       |        |
|--------------------------|--|--|-------|--------|---|-------|--------|
|                          | 99 <sup>th</sup> Percentile Occurrence Probability | 95 <sup>th</sup> Percentile Occurrence Probability |       |        | MDEL = 99 <sup>th</sup> Percentile<br>AMEL = 95 <sup>th</sup> Percentile Occurrence Probability |       |        |
| (CV)                     |  | n = 4  | n = 8 | n = 30 | n = 4   | n = 8 | n = 30 |
| 0.1                      | 1.25   | 1.08   | 1.06  | 1.03   | 1.16  | 1.18  | 1.22   |
| 0.2                      | 1.55   | 1.17   | 1.12  | 1.06   | 1.33  | 1.39  | 1.46   |
| 0.3                      | 1.90   | 1.26   | 1.18  | 1.09   | 1.50  | 1.60  | 1.74   |
| 0.4                      | 2.27   | 1.36   | 1.25  | 1.12   | 1.67  | 1.82  | 2.02   |
| 0.5                      | 2.68   | 1.45   | 1.31  | 1.16   | 1.84  | 2.04  | 2.32   |
| 0.6                      | 3.11   | 1.55   | 1.38  | 1.19   | 2.01  | 2.25  | 2.62   |

Therefore, from Table 2 of the SIP, the LTA multipliers will be as follows:

$$\text{MDEL Multiplier} = 3.11$$

$$\text{AMEL Multiplier} = 1.55$$

The MDEL and AMEL limits are calculated by multiplying the LTA with an LTA multiplier for each limit:

$$\text{Maximum Daily Effluent Limit (MDEL)} = 1.9 \mu\text{g/L} * 3.11 = 5.8 \mu\text{g/L}$$

$$\text{Average Monthly Effluent Limit (AMEL)} = 1.9 \mu\text{g/L} * 1.55 = 2.9 \mu\text{g/L}$$

#### I. Whole Effluent Toxicity (WET)

Whole effluent toxicity (WET) tests measure the aggregate toxic effect of a mixture of pollutants that may be present in a waste stream and provides information on potential toxic impacts to receiving waters from the

discharge of wastes. WET tests measure the degree of response of exposed aquatic test organisms to an effluent. The WET approach provides a means of assessing compliance with the narrative toxicity water quality objective for aquatic life protection of the Basin Plan while implementing numeric criteria for toxicity. There are two types of WET tests: acute and chronic. An acute toxicity test is conducted over a short time period and measures mortality. A chronic toxicity test is conducted over a longer period of time and may measure mortality, reproduction, and development.

The SIP requires that a Toxicity Reduction Evaluation (TRE) be conducted if a discharge causes or contributes to chronic toxicity in a receiving water body. This WDR requires the Discharger to periodically monitor the toxicity of its discharge and to develop a TRE Workplan if the toxicity effluent limitations are exceeded.

#### J. Anti-Backsliding Effluent Limitations

Sections 402(o)(2) and 303(d)(4) of the CWA and 40 CFR section 122.44(l) prohibit backsliding in NPDES permits. The following limits designated with AB in the Final Effluent Limitations table below have the same limit as the previous permit.

#### K. Final Effluent Limitations

### Summary of Water Quality-Based Effluent Limitations Discharge Point

#### Summary of Water Quality-based Effluent Limitations Table

##### Mass Limits

All permit limitations, standards or prohibitions shall be expressed in terms of mass except for pH, or other pollutants which cannot appropriately be expressed by mass or under certain circumstances including "when applicable standards and limitations are expressed in terms of other units of measurement." (40 CFR § 122.45(f)(1)). Therefore, all concentration limits stated above except for Settleable Solids, Acute Toxicity, Chronic Toxicity, Total Coliform, Fecal Coliform, pH, and Dissolved Oxygen shall also have a mass limit based on its concentration limit times the discharge flow limit in the Notice of Enrollment expressed in pounds per day (lbs/d) as shown in the equations below:

Concentration Limit \* Flow Limit \* Conversion Factor = Mass Limit

(mg/l) \* (MGD) \* 8.34 [lb\*L/(Million Gallons\*mg)] = lbs/day

(µg/l) \* (MGD) \* 0.00834 [lb\*L/(Million Gallons\*µg)] = lbs/day

(mg/l) \* (gpd) \* 0.00000834 [lb\*L/(Gallons\*mg)] = lbs/day

(µg/l) \* (gpd) \* 0.0000000834 [lb\*L/(Million Gallons\*µg)] = lbs/day

## B. DISCHARGE SPECIFICATIONS

### 1. DISCHARGES TO BAYS AND HARBORS

The discharge of groundwater extraction waste to Mission Bay, Oceanside Harbor, Del Mar Boat Basin, or Dana Point Harbor shall not contain pollutants in excess of the following effluent limitations:

#### General / Inorganic / Biological

| Parameter               | Units      | Effluent Limitations                                  |                   |                   |                       |                 |

## 2. DISCHARGES TO LAGOONS/ESTUARIES

The discharge of groundwater extraction waste discharges to saline lagoons (only Buena Vista Lagoon is fresh water) and estuaries of the region shall not contain pollutants in excess of the following effluent limitations:

Includes limits to the Bays and Harbors Limitations

| Parameter   | Units | Effluent Limitations                                  |      |                       |                   |
|---|-------|---|------|-----------------------|-------------------|
|   |       | AMEL  | MDEL | Instantaneous Maximum | 6-Month Median    |
| Total Nitrogen  | mg/L  | -   | -    | 2.0 <sup>AB</sup>     | 1.0 <sup>AB</sup> |
| Total Phosphorus  | mg/L  | -   | -    | .02 <sup>AB</sup>     | 0.1 <sup>AB</sup> |
| pH  | Units | Within limit of 7.0 to 8.5 at all times <sup>AB</sup> |      |                       |                   |
| All Parameters and Effluent Limitations from “Bays and Harbors” |       |   |      |                       |                   |

### 3. DISCHARGES TO THE SURF ZONE

The discharge of groundwater extraction waste to the surf zone (3:1 dilution factor) shall not contain pollutants in excess of the following effluent limitations:

#### Discharges to the Surf Zone Calculation

The formula used to calculate effluent limits for constituents discharged to the surf zone is from Table B in the Ocean Plan except for Toxicity and Radioactivity.

$$C_e = C_o + D_m(C_o - C_s)$$

$C_e$  = the effluent concentration limit, ug/L

$C_o$  = the concentration (water quality objective) to be met at the completion of initial dilution, ug/L

$D_m$  = minimum probable initial dilution expressed as parts seawater per part wastewater  
 $D_m = 3$  from findings from the 2001-96 Order.

$C_s$  = background seawater concentration (see Table C), ug/L

| Table C<br>BACKGROUND SEAWATER CONCENTRATIONS ( $C_s$ ) |              |
|---|--------------|
| Waste Constituent                                       | $C_s$ (ug/L) |
| Arsenic   | 3            |
| Copper  | 2            |
| Mercury   | 0.0005       |
| Silver  | 0.16         |
| Zinc  | 8            |
| For all other Table B parameters                        | 0            |

### DISCHARGES TO THE SURF ZONE (3:1 DILUTION FACTOR)<sup>AB</sup>

| Parameter             | Units | Effluent Limitations |                    |                       |                    |
|-----------------------|-------|----------------------|--------------------|-----------------------|--------------------|
|                       |       | AMEL                 | MDEL               | Instantaneous Maximum | 6-Month Median     |

#### 4. DISCHARGES TO INLAND SURFACE WATERS

The discharge of groundwater extraction waste to inland surface waters (including Buena Vista Lagoon) shall not contain pollutants in excess of the following effluent limitations:

##### GENERAL CONSTITUENTS

| Constituent                         | Unit      | AMEL  | Daily<br>Maximum | Instantaneous<br>Maximum | Basis |
|-------------------------------------|-----------|---|------------------|--------------------------|-------|
| Settleable Solids                   | ml/L      | 0.1   | ---              | 0.2                      | AB    |

| 126 Priority Pollutants<br>(Including metals) | 40 CFR 131.38 - Water Quality Standards; Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California. |                          |       |                           |                          | See Below |

## 126 Priority Pollutants - 40 CFR 131.38 - Water Quality Standards; Establishment of Numeric Criteria for Priority Toxic Pollutants for the State of California.

The effluent limits for eight priority pollutants will be developed on a case-by-case basis because the freshwater criteria are based on site-specific water quality data.

Seven metals are dependent on water hardness, Cadmium, Copper, Chromium (III), Lead, Nickel, Silver, and Zinc [See Table 1 to 40 CFR 131.38(b)(2)], and the "Conversion Factors" for Cadmium and Lead are also water hardness dependent. [See Table 3 of 40 CFR 131.38(b)(2)]

In order to calculate the effluent limits for these seven metals the following equations from 40 CFR 131.38(b)(2) will be needed:

$$\begin{aligned} \text{Cd CFa} &= 1.136672 - ((\text{LN}(\text{hardness})) * 0.041838) \\ \text{Cd CFc} &= 1.101672 - ((\text{LN}(\text{hardness})) * 0.041838) \\ \text{Pb CFa\&c} &= 1.46203 - ((\text{LN}(\text{hardness})) * 0.145712) \\ \text{Criterion} &= \text{WER} * \text{CFx} * (\exp(\text{mA} * \text{LN}(\text{hardness})) + \text{bA}) \end{aligned}$$

Pentachlorophenol is dependent on the pH value. [See Footnote "f" to Table in 40 CFR 131.38(b)(1)]

To calculate the effluent limit for Pentachlorophenol use this equation:  
 $\text{CMC} = \exp(1.005(\text{pH}) - 4.869)$ .  $\text{CCC} = \exp(1.005(\text{pH}) - 5.134)$

The remainder of the criteria is not water quality dependent and the effluent limits can be calculated. However, not all the effluent limits will apply to all sites because of the Beneficial use designation for "Municipal" may not apply to all sites.

These priority pollutant effluent limits were calculated the same way as the effluent limits for the bays and harbors.

### Effluent Limitations calculated from CTR and SIP

#### Effluent Limits for Human Health Municipal and Non-Municipal

|    |                | Human Health |        |         |        |
|----|----------------|--------------|--------|---------|--------|
|    |                | MUN          |        | NON-MUN |        |
|    |                | AMEL         | MDEL   | AMEL    | MDEL   |
|    |                | (µg/L)       | (µg/L) | (µg/L)  | (µg/L) |
| A  |                |              |        |         |        |
| 1  | Antimony       | 14           | 28     | 4300    | 8600   |
| 2  | Arsenic        |              |        |         |        |

\* Use equations from 40 CFR 131.38(b)(2)

\*\* Use equations from 40 CFR 131.38(b)(1) footnote "F"

5. Groundwater extraction waste discharged to surface waters must be essentially free of:
  - a. Material that is floatable or will become floatable upon discharge.
  - b. Settleable material or substances that form sediments which degrade<sup>23</sup> benthic communities or other aquatic life.
  - c. Substances which will accumulate to toxic levels in aquatic sediments or biota.
  - d. Substances that significantly<sup>24</sup> decrease the natural light to benthic communities and other aquatic life.
  - e. Materials that result in aesthetically undesirable discoloration of surface waters.
6. Groundwater extraction waste discharged to surface waters shall not cause natural water quality conditions to be altered in areas designated as being of special biological significance or areas that existing marine laboratories use as a source of seawater.
7. Groundwater extraction waste discharged to surface waters shall be discharged in such a manner as to provide maximum protection to aquatic environments.
8. Groundwater extraction waste that contains pathogenic organisms or viruses shall be discharged a sufficient distance from shellfishing and water-contact sports areas to maintain applicable bacterial standards without disinfection. Where conditions are such that an adequate distance cannot be attained, reliable disinfection in conjunction with a reasonable separation of the discharge point from the area must be provided. Disinfection procedures that do not increase effluent toxicity and that constitute the least environmental and human hazard shall be used.
9. The Enrollee shall comply with all items of the "40 CFR Standard Provisions References" that are part of this Order (Attachment B).

#### **IV. Rationale for Receiving Water Limitations**

- A. Surface Water  
Receiving Water Limitations are based upon water quality objectives contained in the Basin Plan. The discharge of groundwater extraction waste from any site shall not, separately or jointly with any other discharge, cause violations of the following water quality objectives in the surface waters of the San Diego Region.
  1. Bacterial Characteristics

a. Water-Contact Standards

Within a zone bounded by the shoreline and a distance of 1,000 feet from the shoreline or the 30-foot depth contour, whichever is further from the shoreline, and in areas outside this zone used for water-contact sports, as determined by the Regional Board, the following bacterial objectives shall be maintained throughout the water column:

- (1) Samples of water from each sampling station shall have a density of total coliform organisms less than 1,000 per 100 ml (10 per ml); provided that not more than 20 percent of the samples at any sampling station, in any 30-day period, may exceed 1,000 per 100 ml (10 per ml), and provided further that no single sample when verified by a repeat sample taken within 48 hours shall exceed 10,000 per 100 ml (100 per ml).
- (2) The fecal coliform density based on a minimum of not less than five samples for any 30-day period shall not exceed a geometric mean of 200 per 100 ml nor shall more than 10 percent of the total samples during any 60-day period exceed 400 per 100 ml.

b. Shellfish Harvesting Standards

At all areas where shellfish may be harvested for human consumption, as determined by the Regional Board, the following bacterial objectives shall be maintained throughout the water column:

- 1) The median total coliform density shall not exceed 70 per 100 ml; and
- 2) Not more than 10 percent of the samples shall exceed 230 per 100 ml.

2. Physical Characteristics

- a. Floating particulates and grease and oil shall not be visible.
- b. The discharge of waste shall not cause aesthetically undesirable discoloration of the surface waters.
- c. Natural light shall not be significantly reduced.
- d. The rate of deposition of solids and the characteristics of inert solids in the sediments shall not be changed such that benthic communities are degraded.

3. Chemical Characteristics

- a. The dissolved oxygen concentration shall not at any time be depressed more than 10 percent from that which occurs naturally, as a result of the discharge of oxygen demanding waste materials.
- b. The pH shall not be changed at any time more than 0.2 units from that which occurs naturally.

- c. The dissolved sulfide concentration of waters in and near sediments shall not be significantly increased above that present under natural conditions.
- d. The concentration of substances set forth in the Discharge Specifications in marine sediments shall not be increased to levels which would degrade indigenous biota.
- e. The concentration of organic materials in the sediments shall not be increased to levels which would degrade marine life.
- f. Nutrient materials shall not cause objectionable aquatic growth or degrade indigenous biota.

4. Biological Characteristics

- a. Marine communities, including vertebrate, invertebrate, and plant species, shall not be degraded.
- b. The natural taste, odor, and color of fish, shellfish, or other aquatic resources used for human consumption shall not be altered.
- c. The concentration of organic materials in fish, shellfish or other aquatic resources used for human consumption shall not bioaccumulate to levels that are harmful to human health.

5. Radioactivity

Discharge of radioactive waste shall not degrade marine life.

6. Toxic Materials Limitations

Since there is no dilution, toxic materials limits are the same as the effluent limits.

**V. Rationale for Monitoring and Reporting Requirements**

Section 122.48 of 40 CFR requires all NPDES permits to specify recording and reporting of monitoring results. Sections 13267 and 13383 of the CWC authorize the Regional Board to require technical and monitoring reports. The MRP, Attachment E of this WDR, establishes monitoring and reporting requirements to implement federal and state requirements. The following provides the rationale for the monitoring and reporting requirements contained in the MRP for this permit.

A. Influent Monitoring (Not applicable)

B. Effluent Monitoring

In reviewing the monitoring reports, the State Board found that although Dischargers were reporting Total Petroleum Hydrocarbons (TPH), a distinction between diesel and gasoline was not always made. Results for TPH should be reported as total TPH, TPH diesel (TPH-d), and TPH gasoline (TPH-g). Also, for detections of TPH-g, the amount of benzene, ethylbenzene, toluene, and xylene

should be reported. Benzene, ethylbenzene, and toluene are priority pollutants. (40 CFR § 131).

C. Whole Effluent Toxicity (WET) Testing Requirements

A WET Limit is required if a discharge causes, has a reasonable potential to cause, or contributes to an exceedance of applicable water quality standards, including numeric and narrative. Since these types of discharges are prohibited under this WDR, WET limits are not applicable.

D. Receiving Water Monitoring

States are required to adopt numeric criteria where they are necessary to protect designated uses. (CWA §§ 303(a) – 303(c)). The Regional Board adopted numeric criteria in the Basin Plan. The Basin Plan is a regulatory reference for meeting the State and Federal requirements for water quality control. (40 CFR 131.20). State Board Resolution 68-16, the Antidegradation Policy, does not allow changes in water quality less than that prescribed in Water Quality Control Plans (Basin Plans). The Basin Plan states that; "The numerical and narrative water quality objectives define the least stringent standards that the Regional Water Board will apply to regional waters in order to protect the beneficial uses." This WDR contains Receiving Water Limitations based on the Basin Plan numerical and narrative water quality objectives for Biostimulatory Substances, Chemical Constituents, Color, Dissolved Oxygen, Floating Material, Oil and Grease, pH, Pesticides, Radioactivity, Salinity, Sediment, Settleable Material, Suspended Material, Tastes and Odors, Temperature, Toxicity and Turbidity.

Section 13267 of the California Water Code states, in part,

(a) A regional board, in establishing ... waste discharge requirements ... may investigate the quality of any waters of the state within its region" and "(b) (1) In conducting an investigation ... the regional board may require that any person who ... discharges ... waste ... that could affect the quality of waters within its region shall furnish, under penalty of perjury, technical or monitoring program reports which the regional board requires. The burden, including costs, of these reports shall bear a reasonable relationship to the need for the report and the benefits to be obtained from the reports.

The attached Monitoring and Reporting Program is issued pursuant to CWC section 13267. The groundwater extraction waste discharge monitoring and reporting program required by this WDR and the attached Monitoring and Reporting Program are necessary to determine compliance with these waste discharge requirements. The Discharger is responsible for the discharges of waste at the facility subject to this WDR.

E. Other Monitoring Requirements (Not Applicable)

## **VI. Rationale for Provisions**

### **A. Standard Provisions**

Standard Provisions, which in accordance with 40 CFR sections 122.41 and 122.42, apply to all NPDES discharges and must be included in every NPDES permit, are provided in Attachment D.

### **B. Special Provisions**

1. Reopener Provisions (Not Applicable)
2. Special Studies and Additional Monitoring Requirements (Not Applicable)
3. Best Management Practices and Pollution Prevention Plan (Not Applicable)
4. Compliance Schedules (Not Applicable)
5. Construction, Operation, and Maintenance Specifications (Not Applicable)
6. Special Provisions for Municipal Facilities (POTWs Only) (Not Applicable)
7. Other Special Provisions

The Dischargers shall dispose of solids removed from liquid wastes in a manner that is consistent with Title 27 of the CCR and approved by the Regional Board.

## **VII. Public Participation**

In considering the re-issuance and adoption of this WDR the Regional Board has developed a draft WDR. The Regional Board encouraged public participation in the WDR adoption process.

### **A. Notification of Interested Parties**

The Regional Board notified interested agencies and persons of its intent to prescribe waste discharge requirements in this WDR and provided them with an opportunity to submit their written comments and recommendations. Notification was posted on the Regional Board's webpage on February 5, 2008, and published in the San Diego Union Tribune, The Riverside Press-Enterprise, and The Orange County Register newspapers on February 8, 2008. On March 12, 2008, the Regional Board sent out notification through the Regional Board Agenda by an electronic mail list.

**B. Written Comments**

Interested persons were invited to submit written comments concerning the tentative WDR. Comments were to be submitted in person, by fax, email, or mail to the Executive Officer at the Regional Board at the address on the cover page of this Permit.

To be fully addressed and considered by the Regional Board, written comments must have been received at the Regional Board office by 5 p.m. on March 5, 2008.

**C. Public Hearing**

The Regional Board held a public hearing on the tentative WDR during its regular meeting on the following date and at the following location:

Date: **March 12, 2008**  
Location: **California Regional Water Quality Control Board  
San Diego Region  
Regional Board Meeting Room  
9174 Sky Park Court, Suite 100  
San Diego, California 92123**

Interested persons were invited to attend. At the public hearing, the Regional Board heard testimony pertinent to the discharge and WDR.

**D. Information and Copying**

WDR-related documents, tentative effluent limitations and special provisions, comments received, and other information are on file and may be inspected at the address above at any time between 8:30 a.m. and 4:45 p.m., Monday through Friday. A partial list of these items are on the Regional Board's web site at: [www.waterboards.ca.gov/sandiego](http://www.waterboards.ca.gov/sandiego)

Copying of documents may be arranged through the Regional Board by calling (858) 467-2952.

**E. Register of Interested Persons**

Any person interested in being placed on the mailing list for information regarding the WDR was invited to contact the Regional Board, reference this WDR, and provide a name, address, and telephone number.

**F. Additional Information**

Requests for additional information or questions regarding this WDR may be directed to Vicente Rodriguez at (858) 627-3940 or at: [VRodriguez@waterboards.ca.gov](mailto:VRodriguez@waterboards.ca.gov)

This WDR will expire on March 12, 2012. Enrollees covered under this WDR at the time of expiration will be required to re-enroll under the reissued permit.

**CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD  
SAN DIEGO REGION**

**RESOLUTION NO. R9-2007-0104**

AMENDMENT TO THE  
*WATER QUALITY CONTROL PLAN FOR THE  
SAN DIEGO BASIN (9)* TO INCORPORATE THE REVISED  
CONDITIONAL WAIVERS OF WASTE DISCHARGE REQUIREMENTS  
FOR SPECIFIC TYPES OF DISCHARGE WITHIN THE SAN DIEGO REGION

WHEREAS, the California Regional Water Quality Control Board, San Diego Region (hereinafter San Diego Water Board), finds that:

1. Section 13260(a)(1) of the Water Code requires that any person (including any city, county, district, or other entity) discharging, or proposing to discharge, wastes within the San Diego Region that could affect the quality of waters of the state, other than into a community sewer system, must file a report of waste discharge (RoWD) with the San Diego Water Board.
2. Section 13050 of the Water Code defines waters of the state as any surface or groundwater, including saline waters, within the boundaries of the state.
3. Section 13263(a) of the Water Code requires that the San Diego Water Board prescribe discharge requirements for any existing or proposed waste discharges within its area of jurisdiction, except discharges into a community sewer system, even if no RoWD has been filed.
4. Section 13269 of the Water Code gives the San Diego Water Board the authority to conditionally waive the provisions of sections 13260(a)(1) and/or 13263(a) for a specific discharge or specific type of discharge where such a waiver is consistent with the Basin Plan and in the public interest and the following conditions are met: 1) the waiver is conditional, 2) waiver conditions include performance of individual, group, or watershed-based monitoring, except for discharges that the State Water Resources Control Board (State Water Board) or a Regional Water Quality Control Board (Regional Water Board) determines not to pose a significant threat to water quality, 3) compliance with waiver conditions by the discharger, and 4) a public hearing is held.
5. According to Water Code section 13350(a)(2), any person who discharges waste in violation of any waiver condition shall be liable civilly, and remedies may be proposed, in accordance with Water Code section 13350(d) or (e).
6. Section 13269 of the Water Code does not give the San Diego Water Board the authority to issue conditional waivers of waste discharge requirements for

discharges subject to federal regulation under Chapter 5.5, commencing with section 13370, Division 7 of the Water Code, implementing the federal Clean Water Act and the Federal National Pollutant Discharge Elimination System (NPDES) regulations.

7. A conditional waiver for a specific discharge or specific type of discharge may be terminated at any time by the State Water Board or San Diego Water Board. A conditional waiver is not required to be used by the San Diego Water Board. Even if a discharger complies with all the conditions of a conditional waiver, the San Diego Water Board may choose to regulate any specific discharge with waste discharge requirements.
8. Nevertheless, there are several types or categories of discharge for which waivers are desirable. Conditional waivers allow the San Diego Water Board to utilize fewer resources, allowing it to focus on discharges that have a higher potential threat to water quality in the Region. Dischargers also benefit from fewer resource requirements when discharging in compliance with a conditional waiver. Therefore, issuing conditional waivers for discharges, whenever possible, is in the best interest of the San Diego Water Board, the dischargers, and the public.
9. The 26 existing conditional waivers renewed by Resolution No. R9-2002-0186 became effective January 1, 2003 and will expire December 31, 2007.
10. When the existing 26 waivers were originally adopted in either 1983, 1993, and/or 1995, the San Diego Water Board acted as lead agency for the projects under the California Environmental Quality Act (CEQA) [Public Resources Code section 21000 et seq.] and adopted Negative Declarations concurrently with the resolutions adopting those conditional waivers. Because the proposed conditions in this Basin Plan amendment for the 26 existing waivers do not differ significantly from the current waiver conditions, the CEQA does not require additional environmental analysis of these waivers in order to renew them with this Resolution.
11. The San Diego Water Board, in compliance with Water Code section 13269, reviewed the waiver conditions for the specific types of discharge eligible for the existing conditional waivers and determined that the waiver conditions should be revised to improve the protection of water quality in the San Diego Region. The existing conditional waivers and proposed revisions to the waiver conditions are reviewed and discussed in Appendix A of the Technical Report entitled *Basin Plan Amendment to Renew and Issue Revised Conditional Waivers of Waste Discharge Requirements for Specific Types of Discharge within the San Diego Region*.
12. The San Diego Water Board also reviewed other specific types of discharge in the San Diego Region that should be allowed to be eligible for conditional waivers. Nine (9) additional specific types of discharge were identified that could be allowed to be eligible for conditional waivers, which include the following:
  - a) *“Low threat” discharges to land.*
  - b) *Discharges from on-site graywater systems.*
  - c) *Discharges from grazing lands.*

- d) *Wildfire suppression and fuels management activities.*
- e) *Discharge/reuse of soils characterized as inert from known contaminated sites.*
- f) *Concrete grinding residues.*
- g) *Temporary waste piles and surface impoundments for disaster related wastes.*
- h) *Temporary waste piles and emergency landfills for mass mortality wastes.*
- i) *Discharges of wastes related to fireworks displays.*

These new types of discharge and proposed waiver conditions are reviewed and discussed in Appendix B of the Technical Report entitled *Basin Plan Amendment to Renew and Issue Revised Conditional Waivers of Waste Discharge Requirements for Specific Types of Discharge within the San Diego Region*.

13. In order to simplify the use of the conditional waivers and waiver conditions, the types of discharge with similar discharge properties, locations, and/or waiver conditions were grouped according to discharge classifications, as shown in Table D-1 in Attachment A. General waiver conditions were developed for a discharger or discharge operation, or all specific types of discharge within a discharge classification. Specific waiver conditions were developed for specific types of discharge within a discharge classification, as applicable.
14. The conditional waivers in the Basin Plan should be amended and issued in accordance with the revisions proposed in section 7 of the Technical Report to allow the certain specific types of discharge to be eligible for conditional waivers. Discharges that can comply with waiver conditions are not expected to pose a significant threat to the quality or beneficial uses of waters in the San Diego Region.
15. Because the conditional waivers are part of the Basin Plan, renewing and issuing the conditional waivers with the proposed revisions require a Basin Plan amendment.
16. Pursuant to Public Resources Code section 21080.5, the Resources Agency has approved the California Regional Water Quality Control Boards' basin planning process as a "certified regulatory program" that adequately satisfies the CEQA (Public Resources Code, section 21000 et seq.) requirements for preparing environmental documents [California Code of Regulations Title 14 section 15251(g) and Title 23 section 3782]. As such, the documents supporting the San Diego Water Board's proposed basin planning action contain the required environmental documentation, including an environmental checklist, under the CEQA and serve as "substitute documents" [California Code of Regulations Title 23 section 3777]. The substitute documents for this project include the environmental checklist, the detailed Technical Report, the Resolution and Basin Plan amendment, and responses to comments submitted during the public participation phase in the development of this Resolution.
17. Because the San Diego Water Board already approved and adopted Negative Declarations for the specific types of discharge adopted by Resolution No. R9-2002-0186, the scope of the environmental analysis required to satisfy CEQA for this Basin Plan amendment was limited to the 9 specific types of discharge added to the revised conditional waivers.

18. The San Diego Water Board circulated a draft Technical Report and environmental checklist and analysis describing the proposed activity to interested individuals and public agencies for review and comment.
19. The accompanying substitute environmental documents satisfy the requirements of substitute documents for a Tier 1 environmental review under CEQA, pursuant to Public Resources Code section 21159 and California Code of Regulations Title 14 section 15187. Project level impacts will need to be considered in any subsequent environmental analysis performed by other entities implementing projects to comply with waiver conditions pursuant to Public Resources Code section 21159.2.
20. The Basin Plan amendment and conditional waivers are consistent with State Water Board Resolution No. 68-16 (*Statement of Policy with Respect to Maintaining High Quality Waters in California*), the state's "Antidegradation Policy." Likewise, the Basin Plan amendment and conditional waivers are consistent with the federal Antidegradation Policy [Code of Federal Regulations Title 40 section 131.12]. The San Diego Water Board must maintain high quality waters of the state unless it is demonstrated that any degradation will be consistent with the maximum benefit to the people of the state, will not unreasonably affect beneficial uses, and will not result in water quality worse than that described in the San Diego Water Board's policies. The conditional waivers in the Basin Plan amendment include conditions that require dischargers to minimize or eliminate discharges of pollutants that can have adverse impacts on the water quality that supports beneficial uses of waters of the state. Conditional waivers for specific discharges can be terminated if waiver conditions are not met.
21. The San Diego Water Board has notified all known interested persons and the public of its intent to consider adoption of the proposed Basin Plan amendment in accordance with Water Code section 13244. Interested persons and the public have had reasonable opportunity to participate in review of the proposed Basin Plan amendment. Efforts to solicit public review and comment have included a public workshop and CEQA scoping meeting held on April 5, 2007; a public review and comment period beginning at least 30-days preceding the public hearing; and a public hearing held on August 8, 2007.
22. The San Diego Water Board has considered all comments pertaining to this Basin Plan amendment submitted to the San Diego Water Board in writing, or by oral presentations at the public hearing held on August 8, 2007. Detailed responses to relevant comments have been incorporated into a Response to Comments document (Appendix E to the Technical Report).
23. The San Diego Water Board has considered the costs of implementing the proposed Basin Plan amendment. The proposed amendment will not result in any additional economic burden for dischargers, except for dischargers that would like to be eligible for Conditional Waiver No. 4, which is for discharges from agricultural and nursery operations. Agricultural and nursery operations that would like to be enrolled under Conditional Waiver No. 4 must prepare a Monitoring and Reporting Program Plan

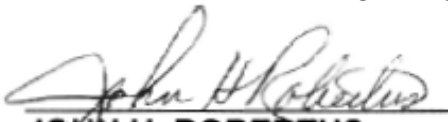

(MRPP) and Quality Assurance Project Plan (QAPP), conduct monitoring, and submit a Monitoring Program Report (MPR).

24. This Basin Plan amendment will result in no adverse effect, either individually or cumulatively, on wildlife.

NOW, THEREFORE, BE IT RESOLVED THAT:

1. The San Diego Water Board hereby adopts the Amendment to the *Water Quality Control Plan for the San Diego Basin (9)* to Incorporate the Revised Conditional Waivers of Waste Discharge Requirements for Specific Types of Discharge within the San Diego Region as set forth in Attachment A to this Resolution.
2. The San Diego Water Board hereby approves the Technical Report entitled *Basin Plan Amendment to Renew and Issue Revised Conditional Waivers of Waste Discharge Requirements for Specific Types of Discharge within the San Diego Region*, dated October 10, 2007.
3. The substitute environmental documents prepared pursuant to Public Resources Code section 21080.5 are hereby certified, and the Executive Officer is directed to file a Notice of Decision with the Resources Agency after State Water Board and Office of Administrative Law approval of the Basin Plan amendment, in accordance with Public Resources Code section 21080.5(d)(2)(E) and California Code of Regulations Title 23 section 3781.
4. The Executive Officer is authorized to sign a Certificate of Fee Exemption for a no adverse impact finding and shall submit this Certificate *in lieu* of payment of the California Department of Fish and Game (CDFG) filing fee.
5. The Executive Officer is directed to submit this Basin Plan amendment to the State Water Board for approval in accordance with Water Code section 13245.
6. If, during the approval process for this amendment, the San Diego Water Board, State Water Board, or Office of Administrative Law determines that minor, non-substantive corrections to the language of the amendment are needed for clarity or consistency, the Executive Officer may make such changes, and shall inform the San Diego Water Board of any such changes.

*I, John H. Robertus, Executive Officer, do hereby certify that the foregoing is a full, true and correct copy of a resolution adopted by the California Regional Water Quality Control Board, San Diego Region, on October 10, 2007.*

## TO RESOLUTION NO. R9-2007-0104

### AMENDMENT TO THE WATER QUALITY CONTROL PLAN FOR THE SAN DIEGO BASIN (9) TO INCORPORATE THE REVISED CONDITIONAL WAIVERS OF WASTE DISCHARGE REQUIREMENTS FOR SPECIFIC TYPES OF DISCHARGE WITHIN THE SAN DIEGO REGION

This Basin Plan amendment incorporates and authorizes the revised conditional waivers of waste discharge requirements for specific types of discharge within the San Diego Region. Chapter 4, Table 4-4, the Table of Contents for the Appendices, and Appendix D of the Basin Plan are amended as follows with revisions shown in ~~red strikeout~~ text for deletions, and blue underlined text for additions:

#### CHAPTER 4 – IMPLEMENTATION

##### CONDITIONAL WAIVERS OF WASTE DISCHARGE REQUIREMENTS ~~WAIVER POLICY~~

The Regional Board may waive issuance of waste discharge requirements and/or the requirement to file reports of waste discharge for a specific discharge or specific types of discharge pursuant to ~~California~~ Water Code Section 13269 if such waiver is determined ~~not~~ to be ~~against consistent with~~ the Basin Plan and in the public interest.

The waiver of adoption of waste discharge requirements is not applicable to discharges subject to federal NPDES ~~permit~~ regulations. The federal Clean Water Act does not provide for a waiver of the need to obtain an NPDES permit for point source discharges of pollutants to surface waters.

Amendments to ~~California~~ Water Code Section 13269, effective January 1, 2003 provided that waivers may not exceed five years duration and must be conditional. Under these amendments the regional boards were required to:

- Renew waivers every five years;
- Review the terms, conditions and effectiveness of each ~~type-of~~ waiver ~~included in their waiver policies~~ at a

public hearing;

- Determine if general or individual waste discharge requirements should be issued for ongoing discharges where waivers have been terminated; and,
- Require compliance with waiver conditions.

~~The~~A waiver of waste discharge requirements is conditional and may be terminated at any time by the Regional Board for any specific discharge or any specific type of discharge. A conditional waiver is not required to be used by the Regional Board. Even if a discharger complies with all the conditions of a conditional waiver, the Regional Board may still choose to regulate any specific discharge with waste discharge requirements.

The Regional Board has determined that a waiver of adoption of waste discharge requirements for a specific type of discharge would not be against the public interest under one or more of the following circumstances:

- The type of discharge is effectively regulated by other public agencies; or
- The type of discharge does not adversely affect the quality or the

## ATTACHMENT A TO RESOLUTION NO. R9-2007-0104

beneficial uses of the waters of the state; or

- The type of discharge is not readily amenable to regulation through adoption of waste discharge requirements but warrants Regional Board oversight to insure compliance with mandated conditions.

On ~~September 11, 2002~~October 10, 2007, the Regional Board conditionally waived adoption of waste discharge requirements for certain specific types of discharges described in Table 4-4. ~~This~~These conditional waivers took effect on January 1, ~~2003~~2008 and expires on January 1, ~~2008~~2013, ~~except for discharges for which Table 4-4 specifies an earlier expiration date.~~

The following general conditions apply to all discharges ~~types~~ described in Table 4-4:

- The discharge shall not create a nuisance or pollution as defined in the ~~California~~ Water Code; and
- The discharge shall not cause a violation of any applicable water quality standard for the receiving waters adopted by the Regional Board, or the State Water Resources Control Board, as required by the Clean Water Act; and
- The discharge of any substance in concentrations toxic to animal or plant life is prohibited.

In addition, the discharges must satisfy the specific conditions described in Table 4-4 and Appendix D.

~~The discharges in Table 4-4 have been assigned to either Category 1 or Category 2, for purpose of Regional Board oversight for determination of compliance with waiver conditions. Discharges covered by Category 1 waivers pose a greater potential threat to water quality than those in Category 2.~~

~~For Category 1 waivers, waste discharge requirements for a specific discharge shall be considered waived only after enrollment in accord with procedures established by the Regional Board. For most of the discharges~~

~~in Category 1, programs administered by the Regional Board or other public agencies will provide the information necessary to satisfy the enrollment requirements. No additional enrollment procedures will be necessary for these discharges.~~

~~An enrollment process has been established for the remaining discharges. Dischargers may contact the Regional Board office to determine if enrollment is necessary for a specific discharge. The Regional Board will determine compliance with Category 1 waiver conditions using a program that includes on-site inspections and/or review of the records of other public agencies that regulate these discharges.~~

~~For Category 2 waivers, enrollment is not necessary. The Regional Board will assess compliance with Category 2 waiver conditions by means of surveys or other indirect methods.~~

**APPENDIX D**  
**CONDITIONS FOR**  
**CONDITIONAL WAIVERS OF WASTE DISCHARGE REQUIREMENTS**  
**IN TABLE 4-4**

In order for the conditional waivers to be consistent with the *Water Quality Control Plan for the San Diego Basin (9)* (Basin Plan), the following general overall conditions apply to each specific type of discharge to be eligible for a conditional waiver:

- The discharge shall not create a nuisance<sup>1</sup> or pollution<sup>2</sup> as defined in the Porter-Cologne Water Quality Control Act (Water Code);
- The discharge shall not cause a violation of any applicable water quality standard for receiving waters adopted by the California Regional Water Quality Control Board, San Diego Region (San Diego Water Board), or the State Water Resources Control Board (State Water Board), as required by the Federal Water Pollution Control Act (Clean Water Act); and
- The discharge of any substance in concentrations toxic to animal or plant life is prohibited.

In addition to the general overall conditions listed above, the San Diego Water Board determined that it is consistent with the Basin Plan and in the public interest to issue conditional waivers under one or more of the following circumstances:

- The type of discharge is effectively regulated by other public agencies; or
- The type of discharge does not adversely affect the quality or the beneficial uses of the waters of the state; or
- The type of discharge is not readily amenable to regulation through adoption of waste discharge requirements (WDRs), but warrants San Diego Water Board oversight to ensure compliance with the mandated conditions (e.g., Basin Plan water quality objectives).

There are 35 specific types of discharge that are eligible for a conditional waiver of waste discharge requirements. However, in examining the specific types of discharge that are eligible for a conditional waiver, several of the discharge types are similar and/or related in terms of discharge setting, discharge source, and/or waiver conditions.

Instead of developing conditional waivers for each specific type of discharge, an integrated approach was employed to simplify the conditional waivers. Types of discharge that are similar in nature or originate from a common setting or operation were grouped together into a

---

<sup>1</sup> "Nuisance" is defined by Water Code section 13050(m) as anything which meets all of the following requirements: (1) Is injurious to health, or is indecent or offensive to the senses, or an obstruction to the free use of property, so as to interfere with the comfortable enjoyment of life or property; (2) Affects at the same time an entire community or neighborhood, or any considerable number of persons, although the extent of the annoyance or damage inflicted upon individuals may be unequal; and (3) Occurs during, or as a result of, the treatment or disposal of wastes.

<sup>2</sup> "Pollution" is defined by Water Code section 13050(l)(1) as an alteration of the quality of the waters of the state by waste to a degree which unreasonably affects waters for beneficial uses or facilities which serve these beneficial uses. Pollution may include contamination.

“discharge classification,” as shown in Table D-1. The grouping allows dischargers to easily identify all the waiver conditions that may apply to their operations.

For example, discharge types that typically require a Clean Water Act section 401 Water Quality Certification (401 Certification) were grouped together in Conditional Waiver No. 6. A type of discharge that typically requires a 401 Certification is one where dredged and/or fill material may be discharged to land and/or surface waters. These types of discharge include sand and gravel mining operations, dredging project wastes, and stream channel alterations. All of these types of discharge have similar waiver conditions.

There are several types of discharge classified as discharges from agricultural and/or nursery operations in Conditional Waiver No. 4. Discharges of plant crop residues, storm water runoff from agricultural lands, mulches and/or amendment applied to soil, agricultural return water or nursery irrigation return water, and green wastes for composting can all occur on the same site. Many of the proposed waiver conditions are similar, and many, if not all, of these types of discharge are found on nursery or agricultural operations.

Therefore, as in the examples above, the types of discharge eligible for conditional waivers were grouped into 11 discharge classifications. One type of discharge may be included in more than one discharge classification. For example, discharges of plant crop residues are included in both Conditional Waiver No. 4 for discharges from agricultural and nursery operations, and Conditional Waiver No. 8 for discharges/disposal of solid wastes to land.

Table D-1 lists the discharge classifications and associated conditional waiver identification number, and groups the specific types of discharge according to those discharge classifications.

| <u>7</u>                      | <u>Discharges of recycled water to land</u>                                    | a) <u>Discharges from short-term recycled water projects (without permanent recycled water delivery and/or distribution systems, not to exceed 365 days)</u><br>b) <u>Discharges from permanent recycled water projects (with permanent recycled water delivery and/or distribution systems, limited to the period prior to the discharge being authorized and regulated under WDRs, WRRs, and/or MRPs, not to exceed 365 days)</u> |
| <u>8</u>                      | <u>Discharges/disposal of solid wastes to land</u>                             | a) <u>Discharges of plant crop residues to land</u><br>b) <u>Discharge/application of amendments and mulches to soil</u><br>c) <u>Discharges of inert wastes to solid waste disposal facilities only accepting inert wastes</u><br>d) <u>Discharges of soils containing wastes to temporary waste piles</u><br>e) <u>Discharge/disposal/reuse of soils characterized as inert from contaminated sites to land</u>                   |
| <u>9</u>                      | <u>Discharges of slurries to land</u>  | a) <u>Discharges of on-site drilling mud to land</u><br>b) <u>Discharges of concrete grinding residues to land</u>  |
| <u>10</u>                     | <u>Discharges of emergency/disaster related wastes</u>                         | a) <u>Incidental discharges of oil and oily water within a response area during an oil spill response in marine waters</u><br>b) <u>Discharges of disaster related wastes to temporary waste piles and surface impoundments</u><br>c) <u>Discharges of mass mortality waste to temporary waste piles and emergency landfills</u><br>d) <u>Other discharges of emergency/disaster related wastes</u>                                 |
| <u>11</u>                     | <u>Aerially discharged wastes over land</u>                                    | a) <u>Discharges of wastes related to fireworks displays over land</u><br>b) <u>Other wastes discharged aerially over land that may adversely affect the quality of the groundwaters of the state, but determined to be "low threat" by the San Diego Water Board</u>   |

For each conditional waiver, General Waiver Conditions were developed that are applicable to a discharger or discharge operation, or all specific types of discharge within a discharge classification. Specific Waiver Conditions were developed that are applicable to specific types of discharge within a discharge classification, when specific conditions were determined to be necessary. The General and Specific Waiver Conditions for Conditional Waiver Nos. 1 through 11 are given in the following pages.

This page left intentionally blank

**CONDITONAL WAIVER NO. 1 – DISCHARGES FROM ON-SITE DISPOSAL SYSTEMS**

Conditional Waiver No. 1 is for discharges of effluent from on-site disposal systems which are a source of pollutants that can infiltrate to groundwater. Discharges of effluent from on-site disposal systems include domestic wastewater (sewage) and graywater, but not industrial wastewater, which is discharged to the subsurface, located within the property that generated the waste stream.

The following types of discharge not regulated or authorized under waste discharge requirements (WDRs) may be eligible for Conditional Waiver No. 1:

- Discharges from conventional septic tank/subsurface disposal systems for residential units
- Discharges from conventional septic tank/subsurface disposal systems for commercial/industrial establishments
- Discharges from alternative individual sewerage systems
- Discharges from conventional septic tank/subsurface disposal systems for campgrounds
- Discharges from on-site graywater disposal systems

In order to be eligible for Conditional Waiver No. 1, discharges must comply with certain conditions to be protective of water quality. Waiver conditions applicable to discharges from on-site disposal systems include the following:

1.I.A. General Waiver Conditions for On-site Disposal Systems

1.II.A. Specific Waiver Conditions for On-site Septic and Sewerage Systems

1.II.B. Specific Waiver Conditions for On-site Graywater Systems

Discharges from on-site disposal systems that comply with the general and specific waiver conditions in Conditional Waiver No. 1 are not expected to pose a significant threat to the quality of waters of the state.

**1.I.A. General Waiver Conditions for On-site Disposal Systems**

1. Prevent the direct or indirect discharge of effluent from on-site disposal systems to any surface waters of the state (including ephemeral streams and vernal pools).
2. Effluent from on-site disposal systems must be discharged to the subsurface and cannot surface or pond.
3. Effluent from on-site disposal systems must not adversely affect the quality or beneficial uses underlying groundwater.
4. Effluent from on-site disposal systems must not cause or threaten to cause a condition of contamination, pollution, or nuisance.
5. Effluent from on-site disposal systems must be discharged at least 5 feet above highest known historical or anticipated groundwater level.
6. Effluent from on-site disposal systems must be discharged at least 100 feet away from any surface water body.
7. Effluent from on-site disposal systems must not adversely impact the quality or beneficial uses of groundwater in any water wells.

8. On-site disposal systems must be designed and operated in accordance with applicable regulatory requirements and/or standards as provided in the Specific Conditions.
9. The owner/operator of an on-site disposal system must comply with local, state, and federal ordinances and regulations and obtain any required approvals, permits, certifications, and/or licenses from authorized local agencies. Copies of any approvals, permits, certifications, and/or licenses must be available on site for inspection.
10. The owner/operator of an on-site disposal system must maintain and operate the system in accordance with the design approved by the authorized local agencies.
11. The San Diego Water Board and/or other local regulatory agencies must be allowed reasonable access to the site in order to perform inspections and conduct monitoring.
12. On-site disposal systems can only accept domestic wastes and/or wastewater.

#### **1.II.A. Specific Waiver Conditions for On-site Septic and Sewerage Systems**

1. For existing on-site septic or sewerage systems, the following conditions apply:
  - a) Existing on-site septic or sewerage systems serving campgrounds must not allow connections from recreational vehicles.
  - b) Owners/operators of existing on-site septic or sewerage systems that cause a condition of contamination, pollution, or nuisance must cease the use of the system and repair or replace it with a compliant system, or permanently remove the system from operation.
  - c) After adoption of State Water Board on-site wastewater treatment system (OWTS) regulations, any existing on-site septic or sewerage systems that is replaced, requires major repair, pools or discharges to the surface of the ground, or has the reasonable potential to cause a violation of water quality objectives, to impair present or future beneficial uses of water, to cause pollution, nuisance, or contamination of waters of the state must be brought into compliance with new OWTS regulations. Owners/operators of on-site septic or sewerage systems that cannot bring their system into compliance must cease the use of the system and replace it with a compliant system, or permanently remove the system from operation.
2. For new on-site septic or sewerage systems, the following conditions apply:
  - a) New on-site septic or sewerage systems installed at campgrounds must not allow connections from recreational vehicles.
  - b) New on-site septic or sewerage systems must comply with the conditions set forth in the section entitled *Guidelines for New Community and Individual Sewerage Facilities* in Chapter 4 (Implementation) of the Basin Plan.
  - c) New on-site septic or sewerage systems proposed to be constructed in areas where groundwater water quality objectives have been exceeded must be evaluated for potential adverse effects on groundwater quality and beneficial uses to determine if regulating the system with individual WDRs is more appropriate.
  - d) New on-site septic or sewerage systems proposed to be constructed within areas designated as Zone A, as defined by the California Department of Public Health's Drinking Water Source Assessment and Protection Program, must be

constructed with an adequate setback from the drinking water supply source that will be protective of drinking water quality.

- e) Six (6) months after adoption of State Water Board OWTS regulations, applications received by the authorized local agency for the construction of new on-site septic or sewerage systems must be in compliance with new OWTS regulations for design and installation.

**1.II.B. Specific Waiver Conditions for On-site Graywater Systems**

1. An on-site graywater system must be permitted by the city, county, or other authorized local agency that has jurisdiction over the installation. The on-site graywater system must be designed and installed, at a minimum, according to the California Plumbing Code (CPC) Graywater Standards.<sup>3</sup> If the city, county, and/or other authorized local agencies have additional requirements, the graywater system must be designed and installed to comply with those requirements.
2. On-site graywater systems proposed to be constructed in areas where groundwater water quality objectives have been exceeded must be evaluated for potential adverse effects on groundwater quality and beneficial uses to determine if regulating the system with individual WDRs is more appropriate.
3. New on-site graywater systems proposed to be constructed within areas designated as Zone A, as defined by the California Department of Public Health's Drinking Water Source Assessment and Protection Program, must be constructed with an adequate setback from the drinking water supply source that will be protective of drinking water quality.

## **CONDITIONAL WAIVER NO. 2 – “LOW THREAT” DISCHARGES TO LAND**

Conditional Waiver No. 2 is for “low threat” discharges to land, which can percolate to groundwater. “Low threat” discharges include liquid wastes containing pollutant concentrations that are not expected to adversely impact the quality of waters of the state under ambient conditions. “Low threat” discharges may include potable water or uncontaminated groundwater. Potable water and uncontaminated groundwater are not considered waste when initially discharged. However, when this water comes into contact with pollutants and transports those pollutants in surface runoff or leaches those pollutants into the soil and groundwater, it becomes a waste. “Low threat” discharges to land are not expected to contain significant concentrations of pollutants that can adversely affect the quality of underlying groundwater.

The following types of discharge not regulated or authorized under waste discharge requirements (WDRs) may be eligible for Conditional Waiver No. 2:

- Discharges from the construction and test pumping of water wells to land
- Discharges of air conditioner condensate or non-contact cooling water to land
- Swimming pool discharges to land
- Discharges from short-term construction dewatering operations to land
- “Low Threat” discharges to land and/or groundwater, which may including the following:
  - Groundwater pumped from drinking water wells
  - Groundwater from foundation drains, crawl space pumps, and footing drains
  - Discharges from flushing water lines
  - Discharges from washing vehicles, pavement, buildings, etc.
  - Infiltration from residential/commercial/industrial/recreational facility landscape and lawn irrigation using groundwater or municipal supply water
  - Infiltration from structural infiltration-based best management practices (BMPs)

In order to be eligible for Conditional Waiver No. 2, discharges must comply with certain conditions to be protective of water quality. Waiver conditions applicable to “low threat” discharges to land include the following:

- 2.I.A. General Waiver Conditions for “Low Threat” Discharges of Water to Land
- 2.II.A. Specific Waiver Conditions for Air Conditioner Condensate and Non-contact Cooling Water Discharges to Land
- 2.II.B. Specific Waiver Conditions for Swimming Pool Discharges to Land
- 2.II.C. Specific Waiver Conditions for Pumping of Groundwater from Wells to Land
- 2.II.D. Specific Waiver Conditions for Dewatering Operations Discharged to Land
- 2.II.E. Specific Waiver Conditions for Discharges from Washing Vehicles, Pavement, Buildings, etc. to Land
- 2.II.F. Specific Waiver Conditions for Discharges from Irrigated Lawns and Landscaping Using Groundwater or Municipal Supply Water
- 2.II.G. Specific Waiver Conditions for Discharges from Structural BMPs that Require Infiltration

“Low threat” discharges to land that comply with the general and specific waiver conditions in Conditional Waiver No. 2 are not expected to pose a threat to the quality of waters of the state.

**2.I.A. General Waiver Conditions for “Low Threat” Discharges of Water to Land**

1. Prevent the direct or indirect discharge of “low threat” discharges to any surface waters of the state (including ephemeral streams and vernal pools).
2. “Low threat” discharges must not cause the migration of contaminants such as chlorinated solvents, hydrocarbons, or other toxic or hazardous substances to groundwater.
3. “Low threat” discharges must not come in contact with any material that consists of or is contaminated with chlorinated solvents, hydrocarbons, or other toxic or hazardous substances prior to discharge to land.
4. Any products used to condition or treat “low threat” discharges prior to discharging to land must be in accordance with manufacturer’s instructions and guidelines, and must reliably attenuate before infiltrating to underlying groundwater.
5. “Low threat” discharges to land must not adversely affect the quality or beneficial uses of underlying groundwater.
6. “Low threat” discharges to land must not cause or threaten to cause a condition of contamination, pollution, or nuisance.
7. “Low threat” discharges to land must not adversely impact the quality or beneficial uses of groundwater in any water wells.
8. The San Diego Water Board and/or other local regulatory agencies must be allowed reasonable access to the site in order to perform inspections and conduct monitoring.
9. Discharger must submit a Notice of Intent or technical and/or monitoring program reports when directed by the San Diego Water Board.

**2.II.A. Specific Waiver Conditions for Air Conditioner Condensate and Non-contact Cooling Water Discharges to Land**

1. Discharges must not contain contact cooling water.
2. Discharges of air conditioner condensate and non-contact cooling water to land must not exceed an average of 1,200 gallons per day for any continuous 365-day period, unless the discharger has filed a Notice of Intent containing information about the operator, location, and planned period of and average daily volume of discharge.

**2.II.B. Specific Waiver Conditions for Swimming Pool Discharges to Land**

1. Discharges of water from each swimming pool to land must not exceed 50,000 gallons during any continuous 365-day period, unless the discharger has filed a Notice of Intent containing information about the swimming pool location and volume, planned period of and frequency of discharge.

**2.II.C. Specific Waiver Conditions for Pumping of Groundwater from Wells to Land**

1. The discharge of groundwater pumped from any well that is used in a soil and/or groundwater contamination investigation or corrective action may not be discharged to land, unless the discharger has filed a Notice of Intent containing monitoring data demonstrating that the quality of the proposed discharge would not cause the groundwater at the disposal site to exceed water quality objectives.

2. For multiple applications of groundwater from wells pumped to land over a 365-day period, or a continuous 24-hour (or longer) application of groundwater from wells pumped to land within a 365-day period, the discharger must file a Notice of Intent containing information about the operator, location, planned period of and frequency of discharge, and measures that will be taken to minimize or eliminate the discharge of pollutants that might affect surface water and groundwater quality. Sufficient information demonstrating compliance with waiver conditions must be submitted before the discharge may begin.
3. Groundwater cannot originate from an area that contains any contaminated soil or groundwater.

**2.II.D. Specific Waiver Conditions for Dewatering Operations Discharged to Land**

1. The discharge of groundwater pumped from any well or excavation that is used in a soil and/or groundwater contamination investigation or corrective action may not be discharged to land, unless the discharger has filed a Notice of Intent containing monitoring data demonstrating that the quality of the proposed discharge would not cause the groundwater at the disposal site to exceed water quality objectives.
2. For dewatering operations that discharge an average of 5,000 gallons per day for any continuous 180-day period, the discharger must file a Notice of Intent containing information about the operator, location, planned period and rate of discharge, and measures that will be taken to minimize or eliminate the discharge of pollutants that might affect groundwater quality. Sufficient information demonstrating compliance with waiver conditions must be submitted before the discharge may begin.
3. Groundwater cannot originate from an area that contains any contaminated soil or groundwater.

**2.II.E. Specific Waiver Conditions for Discharges from Washing Vehicles, Pavement, Buildings, etc. to Land**

1. Discharges of wash water and similar intermittent discharges must not exceed an average of 1,200 gallons per day for any continuous 30-day period, unless the discharger has filed a Notice of Intent containing information about the operator, location, and planned period of and average daily volume of discharge.

**2.II.F. Specific Waiver Conditions for Discharges from Irrigated Lawns and Landscaping Using Groundwater or Municipal Supply Water**

1. Products applied to lawns and landscaping must be in accordance with manufacturer's instructions and guidelines, and must reliably attenuate before infiltrating to underlying groundwater.

**2.II.G. Specific Waiver Conditions for Discharges from Structural BMPs that Require Infiltration.**

1. Installation of structural BMP that utilizes infiltration must comply with the design criteria of the municipality regulated by MS4 WDRs (NPDES storm water permit), or, for any discharge that exceeds an average of 1,200 gallons per day for any continuous 365-day period, the discharger must file a Notice of Intent containing documentation demonstrating that the quality of the proposed discharge from infiltration will not cause the groundwater at the disposal site to exceed water quality objectives.

**ATTACHMENT A TO RESOLUTION NO. R9-2007-0104**

2. Installation of structural BMPs that require infiltration must comply with local, state, and federal ordinances and regulations and obtain any required approvals, permits, certifications, and/or licenses from authorized local agencies.

### **CONDITIONAL WAIVER NO. 3 – DISCHARGES FROM ANIMAL OPERATIONS**

Conditional Waiver No. 3 is for discharges from animal operations, which contain pollutants that can percolate to groundwater or runoff to surface waters. Discharges from animal operations include discharges resulting from animal activities and wastes, and storm water runoff which can also transport pollutants from animal operations to surface waters and groundwater.

The following types of discharge not regulated or authorized under waste discharge requirements (WDRs) may be eligible for Conditional Waiver No. 3:

- Discharges from small animal feeding operations (less than 300 animal units, where 1 animal unit is equivalent to one cow or 1,000 animal pounds)
- Discharges from medium animal feeding operations (300 to 999 animal units)
- Discharges of storm water runoff
- Discharges of manure to compost operations
- Discharge/application of manure to soil as an amendment or mulch
- Discharges from grazing lands

In order to be eligible for Conditional Waiver No. 3, discharges must comply with certain conditions to be protective of water quality. Waiver conditions applicable to discharges from animal operations include the following:

- 3.I.A. General Facility Design and Management Waiver Conditions
- 3.I.B. General Manure Management Waiver Conditions
- 3.I.C. General Waiver Conditions for Application of Manure from Animal Operations as a Fertilizer, Amendment, or Mulch to Soil
- 3.I.D. General Inspection and Reporting Waiver Conditions
- 3.II.A. Specific Waiver Conditions for Small Animal Feeding Operations
- 3.II.B. Specific Waiver Conditions for Medium Animal Feeding Operations
- 3.II.C. Specific Waiver Conditions for Grazing Operations

Discharges from animal operations that comply with the general and specific waiver conditions in Conditional Waiver No. 3 are not expected to pose a threat to the quality of waters of the state.

#### **3.I.A. General Facility Design and Management Waiver Conditions**

1. Animal operations must comply with any local, state, and federal ordinances and regulations and obtain any required approvals, permits, certifications, and/or licenses from authorized local agencies.
2. Animal operations must implement management measures (MMs) and/or best management practices (BMPs) to minimize or eliminate the discharge of pollutants that may adversely impact the quality or beneficial uses of waters of the state. Recommended MMs/BMPs are provided in *Equestrian-Related Waste Quality Best Management Practices* available from the County of San Diego Department of Agriculture, Weights and Measures, and/or the *Field Office Technical Guide*

available from the Natural Resource Conservation Service (NRCS), or other sources.

3. Animal operations must prevent direct contact of animals with surface water bodies. Animals should not be allowed to graze directly adjacent to or within stream banks. Animal operations should maintain a buffer zone or riparian filter strip between the animals and any surface waters of the state. The buffer zone must adequately minimize the discharge of pollutants from an animal operation. There should be no direct exposure of a surface water body to an animal.

### **3.I.B. General Manure Management Waiver Conditions**

1. Animal operations must prevent the direct or indirect discharge of animal wastes (manure, urine, soiled bedding) to any surface waters of the state (including ephemeral streams and vernal pools).
2. Animal operations must properly manage the wastes (i.e., manure, urine, soiled bedding) generated by the animals at the facility in accordance with the following guidelines:
  - a) Animal wastes should be collected and disposed of regularly (at least once every two weeks).
  - b) Animal wastes can be stored temporarily (no longer than two weeks) on site until disposal, unless animal wastes are composted on site. The amount of animal wastes stored in temporary storage area must not exceed the capacity of the storage area. If animal wastes exceed, or threaten to exceed the capacity of the temporary storage area, the animal wastes should be disposed of immediately.
  - c) Areas adjacent to temporary storage area for animal wastes should be graded to prevent storm water and surface runoff from reaching the storage area.
  - d) Temporary storage area should be on an impervious surface (e.g., concrete pad or plastic tarp) to prevent leaching of pollutants to groundwater.
  - e) Temporary storage area should be protected with a roof or cover, or at a minimum be covered with plastic sheeting if precipitation is forecast within the next 24 hours, to prevent direct contact between precipitation and animal wastes.
  - f) A buffer zone of at least 100 feet should be maintained between the temporary storage area for animal wastes and any surface water body unless sufficient information is provided to demonstrate that a proposed alternative is protective of water quality.
  - g) If animal wastes are used as a fertilizer, soil amendment, or mulch on grazing lands, application of animal wastes to soil must comply with the conditions in 3.I.C.

### **3.I.C. General Waiver Conditions for Application of Manure from Animal Operations as a Fertilizer, Amendment, or Mulch to Soil**

1. If fresh and/or uncomposted manure is applied as a fertilizer, amendment, or mulch to soil, manure must be applied to the same property where the manure was generated.
2. Dried, processed, or composted manure may be applied as a fertilizer, amendment, or mulch to soil on sites other than the property where the manure was generated. Dried, processed, or composted manure may also be applied as a fertilizer, amendment, or mulch to soil on the same property where the manure was

- generated. Use of dried, processed, or composted manure on or off the property where the manure was generated must comply with the waiver conditions in 3.I.D.
3. A buffer zone of at least 100 feet should be maintained between the manure applied to soil and any surface waters of the state, unless sufficient information is provided to demonstrate that a proposed alternative is protective of water quality.
  4. The amount of soil amendment or mulch materials that can be applied to soil must be reasonable for the crop or plant, soil, climate, special local situations, management system, and type of soil amendment or mulch. Application rates must take into account storm events during the rainy season (October-May). Application rates must not allow soil amendment or mulch materials to be transported off the property in storm water runoff during the rainy season. Resources are available from the NRCS, University of California Cooperative Extension (UCCE), and other organizations. A copy of the calculations and/or estimate of the application rate must be available on site for inspection.
  5. Apply amendment or mulch materials to soil at site-specific rates appropriate to the season (i.e., dry vs. rainy).
  6. Implement MMs/BMPs in areas with soil amendment or mulch materials to minimize or eliminate runoff and leachate to surface waters and groundwater.

**3.I.D. General Inspection and Reporting Waiver Conditions**

1. The San Diego Water Board and/or other local regulatory agencies must be allowed reasonable access to the site in order to perform inspections and conduct monitoring.
2. Animal operations must submit a Notice of Intent or technical and/or monitoring program reports when directed by the San Diego Water Board.

**3.II.A. Specific Waiver Conditions for Small Animal Feeding Operations**

1. Small animal feeding operations (AFOs) must not discharge any pollutants to waters of the United States through any man-made conveyance, or directly to waters of the United States which originate outside of and pass over, across or through the facility or otherwise come into direct contact with the animals confined in the operation.
2. Small AFOs must be operated and maintained in accordance with the regulations in California Code of Regulations Title 27 sections 22562 through 22565.

**3.II.B. Specific Waiver Conditions for Medium Animal Feeding Operations**

1. Medium AFOs must not discharge any pollutants to waters of the United States through any man-made conveyance, or directly to waters of the United States which originate outside of and pass over, across or through the facility or otherwise come into direct contact with the animals confined in the operation.
2. Medium AFOs must be operated and maintained in accordance with the regulations in California Code of Regulations Title 27 sections 22562 through 22565.
3. Medium AFO facility owners or operators must file a Notice of Intent with the San Diego Water Board containing, at a minimum, the following information:
  - a) Property owner name and address
  - b) AFO owner/operator name and address
  - c) Number and types of animals
  - d) Map of the AFO facility showing the locations of manure stockpiles, nearby surface water bodies, and/or water wells

- e) Description of existing and planned MMs/BMPs for the prevention of erosion and discharges of animal wastes that could affect the quality of waters of the state. Sufficient information demonstrating compliance with general and specific waiver conditions must be submitted in order for the medium AFO facility to be eligible for a conditional waiver.

**3.II.C. Specific Waiver Conditions for Grazing Operations**

1. Grazing operations must manage grazing fields to allow lands to revegetate and minimize topsoil erosion.
2. Owners of pasture and range lands used for grazing, must implement MMs/BMPs to minimize or eliminate any discharge that could adversely affect the quality or beneficial uses of waters of the state.

**List of References**

The following list of references provides additional information that is available regarding appropriate MMs/BMPs for minimizing pollutants in runoff and other discharges from animal operations.

## **CONDITIONAL WAIVER NO. 4 – DISCHARGES FROM AGRICULTURAL AND NURSERY OPERATIONS**

Conditional Waiver No. 4 is for discharges from agricultural and nursery operations, which contain pollutants that can percolate to groundwater or runoff to surface waters. Discharges from agricultural and nursery operations include discharges resulting from growing operations, irrigation return flows, and storm water runoff which can also transport pollutants from agricultural and nursery operations to surface waters and groundwater.

The following types of discharge not regulated or authorized under waste discharge requirements (WDRs) may be eligible for Conditional Waiver No. 4:

- Discharges of plant crop residues to land
- Discharges of storm water runoff
- Discharge/application of amendments or mulches to soil
- Discharges of agricultural irrigation return water
- Discharges of nursery irrigation return water

In order to be eligible for Conditional Waiver No. 4, discharges must comply with certain conditions to be protective of water quality. Waiver conditions applicable to discharges from agricultural and nursery operations include the following:

4.I.A. General Facility Design and Management Waiver Conditions

4.I.B. General Enrollment and Education Waiver Conditions

4.I.C. General Waiver Conditions for Application of Compost as a Fertilizer, Amendment, or Mulch to Soil

4.I.D. General Waiver Conditions for Application of Products Used in Agricultural and Nursery Operations

4.I.E. General Inspection and Reporting Requirements

4.II.A. Specific Waiver Conditions for Agricultural Operations

4.II.B. Specific Waiver Conditions for Nursery Operations

Discharges from agricultural and nursery operations that comply with the general and specific waiver conditions in Conditional Waiver No. 4 are not expected to pose a threat to the quality of waters of the state.

### **4.I.A. General Facility Design and Management Waiver Conditions**

1. Agricultural and nursery operations must comply with any local, state, and federal ordinances and regulations and obtain any required approvals, permits, certifications, and/or licenses.
2. Agricultural and nursery operations must implement management measures (MMs) and/or best management practices (BMPs) to minimize or eliminate the discharge of pollutants that may adversely impact the quality or beneficial uses of waters of the state. Recommended MMs/BMPs are available in the State Water Board's Nonpoint Source (NPS) Program Plan and/or available from University of California

Cooperative Extension (UCCE), Natural Resources Conservation Service (NRCS), and/or regional resource conservation districts (RCDs).

**4.I.B. General Enrollment and Education Waiver Conditions**

1. Agricultural and nursery operators must perform a self assessment to identify the pollutants present on the site and assess the potential for runoff and/or infiltration to adversely affect the quality or beneficial uses of the waters of the state. Annual self assessments must be available on site for inspection. If an agricultural or nursery operator does not have proof available during an inspection, the operator must submit proof to the inspecting agency and the San Diego Water Board within 45 days from the date of inspection. Self assessment questionnaires are available from the UCCE.
2. Agricultural and nursery operators must complete at least 2 hours of water quality management related training annually. Training may include formal classroom training or meetings with a training component. Proof of training must be available on site for inspection. Agricultural and nursery operators who do not have proof available during an inspection must submit proof to the inspecting agency and the San Diego Water Board within 45 days from the date of inspection.
3. Agricultural and nursery operators must be in regular contact with the local Farm Bureau, UCCE, NRCS, and/or regional RCDs so they can be informed of the latest MMs/BMPs and developments with water quality issues. Proof of contact (e.g., newsletter addressed to facility, NRCS conservation plan, UCCE self assessment) must be available on site for inspection. Agricultural and nursery operators who do not have proof available during an inspection must submit proof to the inspecting agency and the San Diego Water Board within 45 days from the date of inspection.
4. Agricultural and nursery operations must implement MMs/BMPs to minimize or eliminate the discharge of pollutants that may adversely impact the quality or beneficial uses of waters of the state. Recommended MMs/BMPs are available in the State Water Board's NPS Program Plan and/or available from UCCE, NRCS, and/or regional RCDs.
5. Agricultural and nursery operators shall maintain records pertaining to the water quality management efforts for the operation. The records shall include the following information:
  - a) Site map showing locations of MMs/BMPs and nearby surface water bodies and/or water wells
  - b) List of hazardous materials kept on the property
  - c) Location and amount of waste materials (e.g., green wastes, trash) generated and composted and/or reused on site, or disposed of off site
  - d) Pesticide use reports and records
  - e) Fertilizer, soil amendment, and mulch use records
  - f) Irrigation management records (i.e., water use, irrigation system, irrigation schedule, etc.)
  - g) Equipment maintenance records
  - h) List of MMs/BMPs implemented to minimize and/or eliminate runoff to surface waters and/or infiltration to groundwater
  - i) Owner, operator, and employee education and training records
  - j) Inspection reports
  - k) Self assessments

- l) Contacts with Farm Bureau, UCCE, NRCS, regional RCDs, and/or other organizations
  - m) Copies of any permits, licenses, and certifications required for the operation
  - n) Water quality monitoring data (if any)
- Recommended water quality record keeping documentation is available from the UCCE. Water quality management records must be available on site for inspection.
- 6. **No later than December 31, 2010**, agricultural and nursery operations must form or join a monitoring group. The function of the monitoring group is to perform water quality monitoring and report the results to the San Diego Water Board. Monitoring groups will be allowed to divide the costs associated with the water quality monitoring and reporting requirements in 4.I.F among its members. Individual operations not in a monitoring group will be solely responsible for the costs associated with the water quality monitoring and reporting requirements in 4.I.F.
  - 7. **No later than January 1, 2011**, owners/operators of agricultural and nursery operations must file a Notice of Intent, as either an individual operation or as part of a monitoring group, with the San Diego Water Board.
  - 8. A Notice of Intent submitted by a monitoring group on behalf of its members must contain the following information:
    - a) Identify the representative(s) authorized to sign reports submitted on behalf of the group.
    - b) An electronic list of landowners and/or operators participating in the monitoring group including: (a) assessor parcel number(s), (b) parcel size, (c) parcel owner or operator name, (d) types of crops grown on each parcel, (e) number of irrigated acres, and (f) parcel owner or operator mailing address.
    - c) A detailed map of the area included within the monitoring group, preferably in GIS format, identifying individual parcels and/or districts that are participating in the monitoring group.
    - d) A detailed description of irrigation, storm water runoff, nutrient, pesticide, erosion control, composting, and other site-specific MMs/BMPs that have been implemented by each participant in the monitoring group, which must be provided as a written description, on a map, and/or using pictures.

Monitoring group members are not eligible for this waiver until a complete Notice of Intent is filed. The monitoring group must inform the San Diego Water Board when any member ceases to participate in the monitoring group within 30 days of the cessation of participation. Any member who ceases to participate in a monitoring group must file a Notice of Intent as an individual agricultural or nursery operation, in accordance with waiver condition 4.I.B.9, within 30 days of ceasing to participate in the monitoring group.
  - 9. A Notice of Intent filed by an individual agricultural or nursery operation must contain the following information:
    - a) Information about the agricultural or nursery operation including: (a) assessor parcel number(s), (b) parcel size, (c) parcel owner and operator name(s), (d) types of crops grown on each parcel, (e) number of irrigated acres, and (f) parcel owner and operator mailing address(es).
    - b) A detailed map of the operation, preferably in GIS format, with locations of operation boundaries, nearby surface waters and water wells.
    - c) A detailed description of irrigation, storm water runoff, nutrient, pesticide, erosion control, composting, and other site-specific MMs/BMPs that have been

implemented by the operation, which must be provided as a written description, on a map, and/or using pictures.  
An individual agricultural or nursery operation is not eligible for this waiver until a complete Notice of Intent is filed.

**4.I.C. General Waiver Conditions for Application of Compost as a Fertilizer, Amendment, or Mulch to Soil**

1. Prevent the direct or indirect discharge of amendments or mulches to any surface waters of the state (including ephemeral streams and vernal pools).
2. Plant crop residues may be utilized as soil amendment or mulch.
3. Amendments or mulches applied to soil cannot include any of the following additives, unless sufficient information is provided to demonstrate that the waste does not pose a potential threat to water quality: (a) municipal solid wastes; (b) sludges, including sewage sludge, water treatment sludge, and industrial sludge; (c) septage; (d) liquid wastes; (e) oil and grease; and (f) hazardous, designated, and any other wastes determined by the San Diego Water Board to pose a potential threat to water quality.
4. The amount of soil amendment or mulch materials that can be applied to soil must be reasonable for the crop or plant, soil, climate, special local situations, management system, and type of soil amendment or mulch. Application rates must take into account storm events during the rainy season (October-May). Application rates must not allow soil amendment or mulch materials to be transported off the property in storm water runoff during the rainy season. Resources are available from the NRCS, UCCE, and other organizations. A copy of the calculations and/or estimate of the application rate must be available on site for inspection.
5. Apply amendment or mulch materials to soil at site-specific rates appropriate to the season (i.e., dry vs. rainy).
6. Implement MMs/BMPs in areas with soil amendment or mulch materials to minimize or eliminate runoff and leachate to surface waters and groundwater.

**4.I.D. General Waiver Conditions for Application of Products Used in Agricultural and Nursery Operations**

1. Prevent the direct or indirect discharge of products used in agricultural or nursery operations to any surface waters of the state (including ephemeral streams and vernal pools).
2. The application of any products used in agricultural or nursery operations that contain pollutants that may be transported in surface runoff to surface waters or may infiltrate to groundwater must be applied in accordance with manufacturer instructions and guidelines, and must not have an adverse effect on the quality of any waters of the state.
3. Excessive amounts of any products used in agricultural or nursery operations spilled to land must be contained and properly disposed.
4. Any products used in agricultural or nursery operations applied to land must not adversely impact the quality or beneficial uses of groundwater in any water wells.

**4.I.E. General Inspection and Reporting Waiver Conditions**

1. The San Diego Water Board and/or other local regulatory agencies must be allowed reasonable access to the site in order to perform inspections and conduct monitoring.
2. Owners/operators must submit a Notice of Intent or technical and/or monitoring program reports when directed by the San Diego Water Board.
3. By March 31, 2011, each monitoring group and each individual operation not participating in a monitoring group must contact the San Diego Water Board to begin developing a Monitoring and Reporting Program Plan (MRPP) and a Quality Assurance Project Plan (QAPP).
4. By January 1, 2012, each monitoring group and each individual operation not in a monitoring group must submit one MRPP/QAPP to the San Diego Water Board. The MRPP/QAPP must include the monitoring locations, frequency of monitoring, constituents of concern to be monitored, documentation of monitoring protocols, and sufficient information about the agricultural and/or nursery operations to demonstrate that the proposed MRPP/QAPP will adequately document water quality and pollutant loadings, and demonstrate compliance with waiver conditions.
5. By December 31, 2012, each monitoring group and each individual operation not participating in a monitoring group must submit one Monitoring Program Report (MRP) to the San Diego Water Board consistent with the MRPP/QAPP.

**4.II.A. Specific Waiver Conditions for Agricultural Operations**

1. Minimize or eliminate the discharge of any pollutants that could adversely affect the quality or beneficial uses of any waters of the state.
2. Agricultural operators cannot alter surface waters of the state on or off the property, unless the proposed alteration has received a Clean Water Act section 401 Water Quality Certification, individual WDRs, or individual waiver from the San Diego Water Board.

**4.II.B. Specific Waiver Conditions for Nursery Operations**

1. Prevent the direct or indirect discharge of nursery irrigation return water to any surface waters of the United States.
2. Nursery operations must minimize or eliminate the discharge of any pollutants that could adversely affect the quality or beneficial uses of any waters of the state.
3. Nursery operators cannot alter surface waters of the state on or off the property, unless the proposed alteration has received a Clean Water Act section 401 Water Quality Certification, individual WDRs, or individual waiver from the San Diego Water Board.

## **CONDITIONAL WAIVER NO. 5 – DISCHARGES FROM SILVICULTURAL OPERATIONS**

Conditional Waiver No. 5 is for discharges that originate from forest lands, which contains pollutants that can percolate to groundwater or runoff to surface waters. Discharges from forest lands include discharges resulting from timber operations, and storm water runoff which can also transport pollutants from managed forest lands and timber operations to surface waters and groundwater.

The following types of discharge not regulated or authorized under waste discharge requirements (WDRs) may be eligible for Conditional Waiver No. 5:

- Discharges of storm water runoff
- Discharges from timber harvesting projects
- Discharges from wildfire suppression and fuels management activities

In order to be eligible for Conditional Waiver No. 5, discharges must comply with certain conditions to be protective of water quality. Waiver conditions applicable to discharges from silvicultural operations include the following:

### 5.I.A. General Waiver Conditions for Silvicultural Operations

### 5.II.A. Specific Waiver Conditions for Timber Operations on Federal Lands

### 5.II.B. Specific Waiver Conditions for Timber Operations on Non-Federal Lands

Discharges from silvicultural operations that comply with the general and specific waiver conditions in Conditional Waiver No. 5 are not expected to pose a threat to the quality of waters of the state.

### **5.I.A. General Waiver Conditions for Silvicultural Operations**

1. Silvicultural operations (including timber harvesting, timber management, vegetative manipulation, fuels management, road construction, and watershed management) must minimize or eliminate the discharge of any pollutants that could adversely affect the quality or beneficial uses of waters of the state.
2. Silvicultural operations (including timber harvesting, timber management, vegetative manipulation, fuels management, road construction, and watershed management) must comply with any federal, state, or local, state, and federal permitting, licensing, or certification requirements and applicable regulations and ordinances.
3. The San Diego Water Board and/or other local regulatory agencies must be allowed reasonable access to the site in order to perform inspections and conduct monitoring.

**5.II.A. Specific Waiver Conditions for Timber Operations on Federal Lands**

1. The State Water Board and US Environmental Protection Agency (USEPA) must continue to certify the *Water Quality Management Plan for National Forest System Lands in California*.
2. The US Forest Service (USFS) must maintain: (a) a water quality program consistent with the Basin Plan, and (b) a program to monitor the implementation and effectiveness of management measures (MMs) and/or best management practices (BMPs).
3. The USFS must provide the San Diego Water Board copies of the environmental and decision documents containing information documenting that a multi-disciplinary review of the timber harvest proposal has been conducted, and the proposed MMs/BMPs and additional control measures that will be implemented to protect water quality.
4. The USFS must submit a Notice of Intent or technical and/or monitoring program reports when directed by the San Diego Water Board.

**5.II.B. Specific Waiver Conditions for Timber Operations on Non-Federal Lands**

1. The State Water Board must continue to certify the *Water Quality Management Plan for Timber Operations on Nonfederal Lands*.
2. Timber operations within 150 feet of existing structures (i.e., "FireSafe" treatments) that are conducted pursuant to a Notice of Exemption approved by the California Department of Forestry (CDF) are not required to provide notice to the San Diego Water Board, but must keep a copy of the approved Notice of Exemption for at least one year (from the approval date) on site for inspection.
3. For timber operations approved by the CDF pursuant to a Notice of Exemption or Notice of Emergency, a copy of the notice must be provided to the San Diego Water Board.
4. For timber operations with a Timber Harvest Plan (THP) or Non-industrial Timber Management Plan (NTMP) approved by the CDF, a copy of the Plan must be provided to the San Diego Water Board.
5. Owners/operators of non-federal forest lands must submit a Notice of Intent or technical and/or monitoring program reports when directed by the San Diego Water Board.

## **CONDITIONAL WAIVER NO. 6 – DISCHARGES OF DREDGED OR FILL MATERIALS NEARBY OR WITHIN SURFACE WATERS**

Conditional Waiver No. 6 is for discharges of dredged or fill materials nearby or within surface waters of the state. Dredged or fill materials are sources of pollutants that can adversely affect the quality of waters of the state.

The following types of discharge not regulated or authorized under waste discharge requirements (WDRs) may be eligible for Conditional Waiver No. 6:

- Discharges from sand and gravel mining operations
- Discharges from dredging projects
- Discharges from stream channel alteration projects
- Other projects proposing to discharge dredged or fill materials nearby or within surface waters of the state.

In order to be eligible for Conditional Waiver No. 6, discharges must comply with certain conditions to be protective of water quality. Waiver conditions applicable to discharges of dredged or fill materials nearby or within surface waters include the following:

6.I.A. General Waiver Conditions for Projects that Discharge Dredged or Fill Material Nearby or Within Surface Waters Required to Obtain a Surface Mining Permit and/or Federal Permit (River and Harbors Act Section 10 or Clean Water Act Section 404 Permit), and Clean Water Act Section 401 Water Quality Certification

6.II.A. Specific Waiver Conditions for Sand and Gravel Mining Operations

Discharges of dredged or fill materials nearby or within surface waters that comply with the general and specific waiver conditions in Conditional Waiver No. 6 are not expected to pose a threat to the quality of waters of the state.

### **6.I.A. General Waiver Conditions for Projects that Discharge Dredged or Fill Material Nearby or Within Surface Waters Required to Obtain a Surface Mining Permit and/or Federal Permit (River and Harbors Act Section 10 or Clean Water Act Section 404 Permit) and Clean Water Act Section 401 Water Quality Certification<sup>4</sup>**

1. Operators must comply with measures included in the Surface Mining Permit and/or Federal Permit and Clean Water Act section 401 Water Quality Certification to protect surface water and groundwater quality.
2. The San Diego Water Board and/or other local regulatory agencies must be allowed reasonable access to the site in order to perform inspections and conduct monitoring.
3. At least one copy of any permits, licenses, and certifications must be available for on site inspection.

---

<sup>4</sup> For projects that discharge dredged or fill material nearby or within surface waters NOT required to obtain a Surface Mining Permit or Federal Permit (River and Harbors Act section 10 or Clean Water Act section 404 Permit) and Clean Water Act section 401 Water Quality Certification, the discharger must file a Report of Waste Discharge (RoWD) with the San Diego Water Board.

4. Operators must minimize or eliminate the discharge of any pollutants that could adversely affect the quality or beneficial uses of waters of the state.

**6.II.A. Specific Waiver Conditions for Sand and Gravel Mining Operations**

1. Sand and gravel mining operations cannot be conducted in flowing streams or other water bodies.

**CONDITONAL WAIVER NO. 7 – DISCHARGES OF RECYCLED WATER TO LAND**

Conditional Waiver No. 7 is for discharges of recycled water to land. Discharges of recycled water may contain pollutants that can adversely affect the quality of waters of the state. The application of recycled water to land may result in pollutants being concentrated in soils, which may adversely impact the quality of the waters of the state when those concentrated pollutants are leached out during rainfall events and/or overuse of irrigation water. This waiver is not available or applicable to recycled water projects and users subject to rules and regulations established by master reclamation permits (MRPs), issued pursuant to Water Code section 13523.1, or otherwise regulated under waste discharge requirements (WDRs) or water reclamation requirements (WRRs), issued pursuant to Water Code sections 13260 and 13523, respectively.

The following types of discharge not regulated or authorized under WDRs, WRRs, and/or MRP may be eligible for Conditional Waiver No. 7:

- Discharges to land from short-term recycled water projects (without permanent recycled water delivery and/or distribution systems, not to exceed 365 days)
- Discharges to land from permanent recycled water projects (with permanent recycled water delivery and/or distribution systems, limited to the period prior to the discharge being authorized and regulated under WDRs, WRRs, and/or MRP, not to exceed 365 days)

In order to be eligible for Conditional Waiver No. 7, discharges must comply with certain conditions to be protective of water quality. Waiver conditions applicable to discharges of recycled water to land include the following:

7.I.A. General Waiver Conditions for Recycled Water Projects

7.II.A. Specific Waiver Conditions for Short-term Recycled Water Projects

7.II.B. Specific Waiver Conditions for Permanent Recycled Water Projects

Discharges of recycled water to land that comply with the general and specific waiver conditions in Conditional Waiver No. 7 are not expected to pose a threat to the quality of waters of the state.

**7.I.A. General Waiver Conditions for Recycled Water Projects**

1. Prevent all windblown spray and surface runoff of recycled water on to property not owned or controlled by the discharger by implementation of management measures (MMs) and/or best management practices (BMPs).
2. Recycled water discharged to land must not adversely affect the quality or beneficial uses of underlying groundwater.
3. The San Diego Water Board and/or other local regulatory agencies must be allowed reasonable access to the site in order to perform inspections and conduct monitoring.
4. The use of recycled water must comply with the requirements of California Code of Regulations Title 22 section 60310(a) through (j), unless sufficient information is

provided to demonstrate that a proposed alternative is protective of water quality and human health.

5. Recycled water cannot be used for groundwater recharge unless sufficient information is provided to demonstrate that it will be protective of water quality and human health.

#### **7.II.A. Specific Waiver Conditions for Short-term Recycled Water Projects**

1. The operator of a short-term project proposing to discharge recycled water must file a Notice of Intent containing information about the operator, location of the project, source of the recycled water, planned period of and frequency of discharge of recycled water, and the MMs/BMPs or other measures that will be taken to eliminate or minimize the discharge of pollutants that might affect surface water and groundwater quality.
2. The Notice of Intent must include a letter from the permitted recycled water agency supplying the recycled water stating that the project will comply with recycled water regulations in California Code of Regulations Title 22, Division 4, Chapter 3, Articles 1 through 10. The letter shall also specify any monitoring and/or reporting required by the recycled water agency to demonstrate compliance with California Code of Regulations Title 22, Division 4, Chapter 3, Reclamation Criteria, Articles 2, 3, 4, 5, and 5.1.
3. Sufficient information demonstrating that the operator will comply with waiver conditions and applicable recycled water regulations must be submitted before the discharge may begin.
4. The Notice of Intent is valid for 365 days after the submittal of a complete Notice of Intent. A new Notice of Intent must be filed with the San Diego Water Board if the short-term project will exceed 365 days. A new Notice of Intent must be received by the San Diego Water Board at least 60 days prior to the expiration of the previous Notice of Intent. If no new Notice of Intent is received 60 days prior to the expiration of the previous Notice of Intent, the short-term recycled water project must cease operation 365 days after a complete Notice of Intent has been submitted.

#### **7.II.B. Specific Waiver Conditions for Permanent Recycled Water Projects**

1. A recycled water agency proposing to supply and/or distribute recycled water through permanently installed facilities or structures before receiving WDRs must file a Report of Waste Discharge (RoWD) pursuant to Water Code sections 13260 and 13522.5 containing the following:
  - a) Sufficient information for the San Diego Water Board to determine that the project will be consistent with the Water Quality Control Plan for the San Diego Basin and any State Water Resources Control Board recycled water policies, and will comply with all applicable recycled water regulations.
  - b) A letter from the California Department of Public Health (CDPH) stating that the project will comply with recycled water regulations in California Code of Regulations Title 22, Division 4, Chapter 3, Articles 1 through 10. The letter shall also specify any provisions, monitoring, and/or reporting required by the CDPH to demonstrate compliance with California Code of Regulations Title 22, Division 4, Chapter 3, Reclamation Criteria, Articles 2, 3, 4, 5, and 5.1.
  - c) A list of recycled water end users that will be regulated by the recycled water agency, and the proposed monitoring and reporting program the recycled water

- agency will implement to demonstrate that the end users are complying with the waiver conditions and applicable recycled water regulations.
2. The recycled water agency must submit sufficient information demonstrating that the recycled water agency and its end users will comply with waiver conditions and applicable recycled water regulations before the discharge may begin.
  3. The conditional waiver issued to the recycled water agency is valid for 365 days after a completed RoWD has been submitted, or until WDRs are adopted for the project, whichever occurs first. The San Diego Water Board will adopt WDRs at the earliest possible opportunity. If the WDRs cannot be adopted within 365 days after the completed RoWD has been submitted, the recycled water agency must request an extension of the conditional waiver at least 60 days prior to the expiration of the previous conditional waiver. If no request for an extension is received 60 days prior to the expiration of the previous conditional waiver, the permanent recycled water project must cease the discharge of recycled water 365 days after the completed RoWD was submitted.
  4. If a recycled water agency that obtains a waiver in accordance with the waiver conditions in 7.II.B proposes to significantly add to or modify the treatment process (e.g., change the disinfection or filtration processes), then the discharger shall submit a new RoWD containing the information listed in 7.II.B.1 above.

This page left intentionally blank

**CONDITIONAL WAIVER NO. 8 – DISCHARGES/DISPOSAL OF SOLID WASTES TO LAND**

Conditional Waiver No. 8 is for discharges of solid wastes to land, which may be a source of pollutants that can adversely affect the quality of waters of the state.

The following types of discharge not regulated or authorized under waste discharge requirements (WDRs) may be eligible for Conditional Waiver No. 8:

- Discharges of plant crop residues to land
- Discharge/application of amendments and/or mulches to soil
- Discharges/disposal of inert wastes to solid waste disposal facilities only accepting inert wastes
- Discharges of soils containing wastes to temporary waste piles
- Discharges/disposal/reuse of soils characterized as inert from known contaminated sites to land

In order to be eligible for Conditional Waiver No. 8, discharges must comply with certain conditions to be protective of water quality. Waiver conditions applicable to discharges of solid wastes to land include the following:

- 8.I.A. General Waiver Conditions for Discharges of Solid Wastes to Land
- 8.II.A. Specific Waiver Conditions for Discharges of Plant Crop Residues to Land
- 8.II.B. Specific Waiver Conditions for Application of Amendments and Mulches to Soil
- 8.II.C. Specific Waiver Conditions for the Discharge of Soils Containing Wastes to Temporary Waste Piles
- 8.II.D. Specific Waiver Conditions for Discharges of Inert Wastes to Solid Waste Disposal Facilities Only Accepting Inert Wastes
- 8.II.E. Specific Waiver Conditions for the Discharge/Disposal/Reuse of Inert Soils and Materials from Contaminated Sites to Land

Discharges of solid wastes to land that comply with the general and specific waiver conditions in Conditional Waiver No. 8 are not expected to pose a threat to the quality of waters of the state.

**8.I.A. General Waiver Conditions for Discharges of Solid Wastes to Land**

1. Prevent the direct or indirect discharge of solid wastes to any surface waters of the state (including ephemeral streams and vernal pools).
2. Operations or facilities that accept and/or discharge solid wastes to land must comply with local, state, and federal ordinances and regulations and obtain any required permits, certifications, and/or licenses.
3. Solid wastes must not cause or threaten to cause a condition of contamination, pollution, or nuisance.
4. The discharger must minimize or eliminate the discharge of any pollutants that could adversely affect the quality or beneficial uses of waters of the state.
5. The San Diego Water Board and/or other local regulatory agencies must be allowed reasonable access to the site in order to perform inspections and conduct monitoring.

6. Discharger must submit a Notice of Intent or technical and/or monitoring program reports when directed by the San Diego Water Board.

**8.II.A. Specific Waiver Conditions for Discharges of Plant Crop Residues to Land**

1. Plant crop residues must be managed to prevent transport of pollutants to waters of the state.
2. Plant crop residues may be used as feedstock for composting.
3. Plant crop residues cannot be burned and applied to land.
4. Application of any products (e.g., fertilizers, pesticides) to plants or soil must be used in accordance with manufacturer's guidelines and must not have an adverse effect on the quality of any waters of the state.
5. Concentrations of pesticides and/or herbicides or any other pollutants associated with the plant crop residues must not adversely affect the quality or beneficial uses of underlying groundwater.
6. Implement management measures (MMs) and/or best management practices (BMPs) around areas where plant crop residues have been discharged to land to minimize or eliminate runoff and leachate to surface waters and groundwater.

**8.II.B. Specific Waiver Conditions for Application of Amendments and Mulches to Soil**

1. Amendments or mulches applied to soil cannot include any of the following additives, unless sufficient information is provided to demonstrate that the waste does not pose a potential threat to water quality: (a) municipal solid wastes; (b) sludges, including sewage sludge, water treatment sludge, and industrial sludge; (c) septage; (d) liquid wastes; (e) oil and grease; and (f) hazardous, designated, and any other wastes determined by the San Diego Water Board to pose a potential threat to water quality.
2. The amount of soil amendment or mulch materials that can be applied to soil must be reasonable for the crop or plant, soil, climate, special local situations, management system, and type of soil amendment or mulch. Application rates must take into account storm events during the rainy season (October-May). Application rates must not allow soil amendment or mulch materials to be transported off the property in storm water runoff during the rainy season. Resources are available from the Natural Resource Conservation Service (NRCS), University of California Cooperative Extension (UCCE), and other organizations. A copy of the calculations and/or estimate of the application rate must be available on site for inspection.
3. Apply amendment or mulch materials to soil at site-specific rates appropriate to the season (i.e., dry vs. rainy).
4. Implement MMs/BMPs in areas with soil amendment or mulch materials to minimize or eliminate runoff and leachate to surface waters and groundwater.

**8.II.C. Specific Waiver Conditions for the Discharge of Soils Containing Wastes to Temporary Waste Piles**

1. For **any soils containing wastes** temporarily stored in waste piles, the following conditions apply:
  - a) The discharger must submit a signed/completed Section A of the Temporary Waste Pile Certification form within 30 days of the initial discharge of any waste piles to be eligible for this waiver. The property owner must approve and acknowledge the placement of the waste at the site.

- b) The discharger must submit a signed/completed Section B of the Temporary Waste Pile Certification form within 10 working days of completing removal of all waste and restoring the site to its original condition.
- c) Unless otherwise specified in the applicable conditions, no temporary waste piles may remain on a site for longer than 6 months or 180 days.
- d) The temporary discharge of waste must not (a) cause the occurrence of coliform or pathogenic organisms in waters pumped from the basin; (b) cause the occurrence of objectionable tastes and odors in water pumped from basin; (c) cause waters pumped from the basin to foam; (d) cause the presence of toxic materials in waters pumped from the basin; (e) cause the pH of waters pumped from the basin to fall below 6.0 or rise above 9.0; (f) cause pollution, contamination or nuisance or adversely affect the quality or beneficial uses of groundwater or surface waters of the hydrologic subareas established in the Basin Plan; and/or, (g) cause a violation of any discharge prohibitions in the Basin Plan for the San Diego Region.
- e) The discharger must conduct regular inspections of temporary waste piles and associated MMs/BMPs at least once per week. Corrective actions must be taken as necessary to ensure compliance with the conditions of this waiver.
- f) Surface drainage must be diverted away from the temporary waste piles. For all temporary waste piles, the discharger must implement effective MMs/BMPs to prevent surface water runon and runoff from contacting wastes and to prevent erosion and transport of wastes by surface runoff.
- g) Temporary waste piles must be placed at least 5 feet above the highest historically known or anticipated level of groundwater, and more than 100 feet from any surface water of the state, unless sufficient information is provided to demonstrate that a proposed alternative is protective of water quality.
- h) Temporary waste piles must be protected against 100-year peak stream flows as defined by the County flood control agency.
- i) Temporary waste piles must be covered by plastic sheeting (not less than 10 mils thick, unless otherwise specified under the applicable Special Conditions) to adequately prevent rainwater infiltration, control fugitive dust, and other nuisances.
- j) Temporary waste piles must be underlain by either plastic sheeting (not less than 10 mils thick, unless otherwise specified under the applicable conditions) or a liner of low permeability that will prevent leachate from infiltrating to groundwater.
- k) Solid wastes discharged to temporary waste piles, together with any containment materials used at the temporary waste pile, and any underlying geologic materials impacted by the discharge, shall be removed within 180 days, unless otherwise specified under the applicable Special Conditions. Subsequently, the discharger must remove all wastes, treatment facilities, related equipment, and dispose of those items in accordance with applicable regulations. The site must be restored to its original state within 30 days after the temporary waste pile is removed, unless otherwise specified under the applicable Special Conditions.
- l) The discharger must post at least one clearly visible sign listing the following minimum information: a) project name, b) name and address of discharger, c) brief project description, and d) 24-hour contact information – name, address, facsimile, and telephone number for the project for as long as the temporary waste pile remains on the site.

2. For **soils containing petroleum hydrocarbons** temporarily stored in waste piles, the following conditions apply:
  - a) Soils and associated solid waste containing petroleum hydrocarbons discharged into temporary waste piles shall be limited to a maximum time period of 3 months or 90 days on a site.
  - b) Soils and associated solid waste containing petroleum hydrocarbons discharged into temporary waste piles under an initial certification report must be derived from only one source (e.g., one unauthorized release site).
  - c) Temporary waste piles must be covered by plastic sheeting (not less than 10 mils thick) to adequately prevent rainwater infiltration, control fugitive dust, and other nuisances.
  - d) Temporary waste piles must be underlain by either plastic sheeting (not less than 10 mils thick) or a liner of low permeability that will prevent leachate from infiltrating to groundwater.
  - e) In addition to the conditions stated herein, temporary waste piles must conform to applicable provisions in the state's local oversight program (LOP) for Orange, Riverside, or San Diego Counties.
  - f) The site must be restored to its original state within 30 days after removal of the temporary waste pile from the site.
3. For **dredged spoils containing heavy metals** temporarily stored in waste piles, the following conditions apply:
  - a) Dredged spoils and associated solid waste containing heavy metals discharged into temporary waste piles shall be limited to a maximum time period of 9 months or 270 days on a site.
  - b) Temporary waste piles must be covered by either a plastic sheeting to adequately prevent rainwater infiltration, control fugitive dust, and other nuisances. Alternative control methods may be utilized if sufficient information is provided to demonstrate that the proposed alternative is protective of water quality and human health.
  - c) Temporary waste piles must be underlain by plastic sheeting (not less than 20 mils thick) or a liner of lower permeability that will prevent leachate from infiltrating to groundwater. Sufficient information must be provided to the San Diego Water Board demonstrating that the liner and containment facility has been designed to contain all solid wastes and fluids.
  - d) Materials used in containment structures must have the appropriate chemical and physical properties to ensure that such structures do not fail to contain waste because of: the stress of installation, pressure gradients, physical contact with the waste or leachate, or chemical reactions with soil and rock.
  - e) The site must be restored to its original state within 60 days after removal of the temporary waste pile from the site.

**8.II.D. Specific Waiver Conditions for Solid Waste Disposal Facilities Accepting Only Inert Wastes<sup>5</sup>**

1. Inert solid waste must not contain hazardous waste, or soluble or decomposable constituents to be considered inert waste.

---

<sup>5</sup> According to California Code of Regulations Title 27 section 20230(a) "Inert waste" is defined as "that subset of solid waste that does not contain hazardous waste or soluble pollutants at concentrations in excess of applicable water quality objectives, and does not contain significant quantities of decomposable waste."

2. Inert waste cannot contain any “free liquids.”<sup>6</sup>
3. Owner/operator of disposal facility must secure the disposal site and prevent unauthorized disposal by the public.
4. Inert wastes exclude any wastes determined by the San Diego Water Board to potentially have an adverse affect on the quality or beneficial uses of waters of the state, even if classified as inert waste.

**8.II.E. Specific Waiver Conditions for the Discharge/Reuse of Inert Soils and Materials from Contaminated Sites**

1. For **all waste soils characterized as inert (Tier 1 or Tier 2)**, the following conditions apply:
  - a) Inert waste soils from known contaminated sites cannot be transported off site and discharged/disposed/reused directly or indirectly to any surface waters of the state (including ephemeral streams and vernal pools).
  - b) Inert waste soils from known contaminated sites cannot contain significant quantities of decomposable waste.
  - c) Inert waste soils from known contaminated sites cannot contain any “free liquids.”<sup>7</sup>
  - d) Inert waste soils that are discharged/disposed/reused at any site cannot have any hydrocarbon, chlorinated solvent, or other contaminant-based odor.
  - e) Sites that export or import soils characterized as inert from known contaminated sites for use as fill material or any other purpose must comply with an applicable federal, state, or local permitting requirements, regulations, and/or ordinances pertaining to the use of imported soil.
  - f) Sites that export or import soils characterized as inert from known contaminated sites for use as fill material or any other purpose must implement MMs/BMPs to eliminate the potential for erosion and transport of sediment off the site.
  - g) This conditional waiver does not authorize the discharge/disposal/reuse of soil characterized as inert from known contaminated sites outside the boundaries of the San Diego Region.
  - h) Prior to exporting soil characterized as inert from a known contaminated site, the owner/operator of the export site must file a Notice of Intent with the San Diego Water Board. The Notice of Intent must be filed no less than 3 days prior to the beginning of export shipments. The Notice of Intent must include information about the site owner/operator, map of the site showing the locations of excavations, borings and/or stockpiles, MMs/BMPs that will be taken to prevent discharges of waste soil that could affect surface water and groundwater quality, estimated volumes (can be a range of volumes) of inert waste soil that will be generated for use off the site, estimated number (can be a range) and locations of samples that will be collected for characterization, and name of the certified environmental analytical laboratory that will perform the analysis.
  - i) Waste soils from a site with a known or discovered unauthorized release must be characterized and certified as inert in order for the soil to be reused off site. Characterization and certification must include the following minimum requirements:

<sup>6</sup> “Free liquids” defined by California Code of Regulations Title 27 section 20164 as “liquid which readily separates from the solid portions of waste under ambient temperature and pressure.”

<sup>7</sup> “Ibid.”

- i) All waste soils generated during remediation or corrective action must be stockpiled on the site in accordance with the waiver conditions for the discharge of specified soils containing wastes to temporary waste piles. Or, waste soils may be sampled and characterized in-situ prior to transport and disposal or reuse off site
- ii) Waste soil must be segregated into 2 categories:
  - (A) Soil that is impacted by the unauthorized release must be characterized as hazardous, designated, and/or non-hazardous waste and handled in accordance with regulatory requirements for the disposal of solid wastes. Waste soils that do not visually appear impacted, but smells impacted, must be treated as impacted soil and cannot be characterized as inert.
  - (B) Soil that does not appear to be impacted by the unauthorized release, by visual inspection and odor, must be sampled and analyzed to confirm the soil can be characterized as inert waste soil.
- iii) Samples must be collected from the waste soil suspected to be inert for laboratory analysis. The minimum number of samples required to characterize the soil is as follows:

| <u>Volume of Soil</u>      | <u>Required Number of Samples Analyzed</u>                     |
|----------------------------|--|
| <u>0 to &lt;500 cy</u>     | <u>4 samples per 100 cy (12 minimum)</u>                       |
| <u>500 to &lt;5,000 cy</u> | <u>1 additional sample per additional 500 cy</u>               |
| <u>5,000 cy or more</u>    | <u>1 additional sample per additional 1,000 cy<sup>8</sup></u> |

cy = cubic yards

- iv) Samples must be analyzed by a state-certified analytical laboratory using USEPA approved analytical methods for the following constituents:
  - (A) Total concentrations of those Title 22 metals identified as contaminants of concern for the export site. For sites identified with burn ash (i.e., a site where solid waste has been burned at low temperature and the residual burn ash pits and burn ash layers are present in soil), the site shall be investigated and the burn ash will be characterized for disposal purposes according to the protocol established by the lead regulatory agency (e.g., Department of Toxic Substances Control, California Integrated Waste Management Board, or others) to identify contaminants of concern at the site. The soil outside of the area of impact of the burn ash shall be tested for the total concentration of those metals identified as contaminants of concern based on the findings of the burn ash investigation technical study.
  - (B) Total petroleum hydrocarbons (by USEPA Method 8015 – full scan if export site includes oil or fuel as potential or actual contaminants of concern)
  - (C) Polychlorinated biphenyls (if export site includes PCBs as potential or actual contaminants of concern)

<sup>8</sup> Volumes greater than 10,000 cubic yards may rely on fewer samples than 1 per each additional 1,000 cubic yards if characterization complies with SW846 methods for selecting appropriate numbers of samples for waste characterization and statistical analyses. The appropriate number of samples is the least number of samples required to generate a sufficiently representative estimate of the true mean concentration of a chemical contaminant of a waste.

- (D) Volatile and semi-volatile organic compounds (if export site includes volatile and semi-volatile organic compounds as potential or actual contaminants of concern)
  - (E) Pesticides (if export site includes a known agricultural area, or pesticides as potential or actual contaminants of concern)
  - (F) Other constituents (if contaminated portion of the export site is found to contain other pollutants or contaminants)
  - j) If analytical results indicate detectable concentrations of constituents other than Title 22 metals, waste soil cannot be characterized as inert.
2. For reuse of **Tier 1 inert waste soils (full unrestricted reuse within the San Diego Region)**, the following conditions apply:
- a) Soil cannot contain any detectable concentrations of contaminants other than Title 22 metals.
  - b) For those Title 22 metals that have been identified as contaminants of concern for the export Site, samples shall be analyzed by an SW846 method using the reporting limits set forth in the Table provided in Attachment 1. From these data, the 90 percent upper confidence level (UCL) shall be determined. Prior to calculating the 90 percent UCL, one must determine whether the sample set is normally, lognormally or non-normally distributed. If lognormally distributed, one must determine the 90 percent UCL on the lognormal mean. If non-normally distributed, but sufficiently symmetrical, calculate the 90 percent UCL on the median (50<sup>th</sup> percentile), instead of the mean. See USEPA SW846 Chapter 9 and the USEPA Guidance for Data Quality Assessment for a discussion of waste characterization and statistical analysis; in particular the guidance on testing for normality, calculating a 90 percent UCL, and handling of non-detected values.<sup>9</sup>

a. Calculated using Central Valley Water Board Designated Level Methodology, where the Water Quality Goal is the lower value of the Federal or State drinking water primary maximum contaminant level, the Environmental Attenuation Factor is 10, and the Leachability Factor is 100.

b. Values taken from the California Environmental Protection Agency's *Use of California Human Health Screening Levels (CHHSLs) in Evaluation of Contaminated Properties* (CalEPA 2005).

c. Taken from Oak Ridge National Laboratory's *Preliminary Remediation Goals for Ecological Endpoints* (Efroymson, et al 1997).

d. Taken from Kearney Foundation of Soil Science Division of Agriculture and Natural Resources, University of California *Background Concentrations of Trace and Major Elements in California Soil – Special Report* (Bradford, et al 1996).

e. Tier 1 Soil Screening Level for inert waste soils that can be reused without restriction. Tier I SSLs selected based on the following steps: Step 1) Select lower value of Residential CHHSL or e-PRG; Step 2) Select lower value of Step 1 or Inert Waste Target; and, Step 3) Select higher value of Step 2 and Arithmetic Mean Background.

f. These values are not intended to provide clean up levels for soil remaining on-site. Such values should be established based on the contaminants of concern, the site use, and in conjunction with the regulatory agency providing oversight for the remediation effort.

- c) An Inert Waste Certification must be filed with the San Diego Water Board by the owner/operator of the export site within 30 days following completion of export activities. The Inert Waste Certification must include the following information:
- i) Generator name and contact information
  - ii) Export site location, owner name and contact information
  - iii) Map of the export site showing the location of the excavation, borings, stockpiles, and/or samples collected
  - iv) Approximate volume of inert waste soil exported from the site
  - v) Description of BMPs implemented to prevent discharge of waste soil off the export site during excavation and transport.
  - vi) Laboratory analytical data, including number of samples collected, EPA approved analytical methods used, the 90 percent UCL of the data for the contaminants of concern, and name of certified environmental analytical laboratory that performed the analysis.
  - vii) The export site owner, principal executive officer, or authorized representative, and a California registered professional engineer or geologist must sign and certify the Inert Waste Certification. The Inert Waste Certification must include the statement, “*I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.*”
3. For reuse of **Tier 2 inert waste soils (only for commercial or industrial development purposes within the San Diego Region)**, the following conditions apply:
- a) Soil cannot contain any detectable concentrations of contaminants other than Title 22 metals.
  - b) Samples shall be analyzed by an SW846 method using the reporting limits set forth in the Table provided in Attachment 1. From these data, the 90 percent UCL shall be determined. Prior to calculating the 90 percent UCL, one must determine whether the sample set is normally, lognormally or non-normally distributed. If lognormally distributed, one must determine the 90 percent UCL on the lognormal mean. If non-normally distributed, but sufficiently symmetrical, calculate the 90 percent UCL on the median (50<sup>th</sup> percentile), instead of the mean. See USEPA SW846 Chapter 9 and the USEPA Guidance for Data Quality Assessment for a discussion of waste characterization and statistical analysis; in particular the guidance on testing for normality, calculating a 90 percent UCL, and handling of non-detected values.<sup>10</sup>

\* None of the analytical results from any samples collected to characterize the waste soil can exceed the Tier 2 Soil Screening Level for this pollutant.

a. Calculated using Central Valley Water Board Designated Level Methodology, where the Water Quality Goal is the lower value of the Federal or State drinking water primary maximum contaminant level, the Environmental Attenuation Factor is 10, and the Leachability Factor is 100.

b. Values taken from the California Environmental Protection Agency's *Use of California Human Health Screening Levels (CHHSLs) in Evaluation of Contaminated Properties* (CalEPA 2005).

c. Taken from Oak Ridge National Laboratory's *Preliminary Remediation Goals for Ecological Endpoints* (Efroymson, et al 1997).

d. Taken from Kearney Foundation of Soil Science Division of Agriculture and Natural Resources, University of California *Background Concentrations of Trace and Major Elements in California Soil – Special Report* (Bradford, et al 1996).

e. Total Threshold Limit Concentration. Concentrations above the TTL would be classified as hazardous waste.

f. Tier 2 Soil Screening Level for inert waste soils that can be reused only for commercial or industrial land use designation. Tier II SSLs selected based on the following steps: Step 1) Select lower value of Industrial CHHSL or Inert Waste Target; Step 2) Select higher value of Step 1 or ½ Maximum Background; and, Step 3) Select lower value of Step 2 and Total Threshold Limit Concentration.

g. These values are not intended to provide clean up levels for soil remaining on-site. Such values should be established based on the contaminants of concern, the site use, and in conjunction with the regulatory agency providing oversight for the remediation effort.

- c) An Inert Waste Certification must be filed with the San Diego Water Board by the owner/operator of the export site within 30 days following export and placement of the soil. The Inert Waste Certification must include the following information:
- i) Generator name and contact information
  - ii) Export site location, owner name and contact information
  - iii) Approximate volume of inert waste soil exported from the site
  - iv) Description of BMPs implemented to prevent discharge of waste soil off the export site during excavation and transport.
  - v) Laboratory analytical data, including number of samples collected, EPA approved analytical methods used, the 90 percent UCL of the data for the contaminants of concern, and name of certified environmental analytical laboratory performing analysis
  - vi) Import site owner name and contact information, with a map of the site location showing nearby surface water bodies, approximate depth to groundwater, and BMPs that will be implemented to eliminate the potential for discharge of inert waste soils to surface waters.
  - vii) The import site owner, principal executive officer, or authorized representative must provide a signature acknowledging the receipt or planned receipt of the inert waste soil.
  - viii) The export site owner, principal executive officer, or authorized representative, and a California registered professional engineer or geologist must sign and certify the Inert Waste Certification. The Inert Waste Certification must include the statement, "*I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.*"
- d) Tier 2 inert waste soil reused at commercial or industrial development sites must comply with the following conditions:
- i) Tier 2 inert waste soil may only be reused on commercial or industrial sites. It may not be reused at residential, school, or park sites.
  - ii) Tier 2 inert waste soil must be placed at least 5 feet above the highest historically known or anticipated level of groundwater. The soil that separates the inert waste soil from groundwater shall have a significant clay content (greater than 5 percent clay material) or an in-situ permeability of less than  $10^{-5}$  cm/sec.
  - iii) Tier 2 inert waste shall be placed at least 100 feet from the nearest surface water body.
  - iv) Tier 2 inert waste shall be protected against 100-year peak stream flows as defined by the County flood control agency.
  - v) Tier 2 inert waste shall be covered by either: 1) engineered materials (e.g. used as road base, fill beneath buildings, bridge abutments), or 2) not less than 2 feet of noncontaminated, clean fill. The cover shall have a permeability of no more than  $10^{-5}$  cm/sec. Placement of a cover on the inert waste soils shall be completed with 30 days of discharging the final load of inert waste soils at the import site.

**CONDITONAL WAIVER NO. 9 – DISCHARGES OF SLURRIES TO LAND**

Conditional Waiver No. 9 is for discharges of slurries to land, which may be a source of pollutants that can adversely affect the quality of waters of the state. A slurry typically consists of water and some material to form a liquid mixture.

The following types of discharge not regulated or authorized under waste discharge requirements (WDRs) may be eligible for Conditional Waiver No. 9:

- Discharges of drilling muds to land
- Discharges of concrete grinding residues to land

In order to be eligible for Conditional Waiver No. 9, discharges must comply with certain conditions to be protective of water quality. Waiver conditions applicable to discharges of slurries to land include the following:

9.I.A. General Waiver Conditions for Slurries Discharged to Land

9.II.A. Specific Waiver Conditions for Discharges of Drilling Mud to Land

Discharges of slurries to land that comply with the general and specific waiver conditions in Conditional Waiver No. 9 are not expected to pose a threat to the quality of waters of the state.

**9.I.A. General Waiver Conditions for Slurries Discharged to Land**

1. Prevent the direct or indirect discharge of slurries to any surface waters of the state (including ephemeral streams and vernal pools).
2. Slurries must be contained to eliminate the potential for runoff from the site.
3. If slurries are discharged to land for storage, the storage area or sump must be designed to be fully contained and ensure no overflow during discharge with at least 2 feet of freeboard.
4. The floor of the storage area or sump must be at least 5 feet above the highest known historical or anticipated groundwater level.
5. The walls of the storage area or sump must be at least 100 feet away from any surface water body or municipal water well.
6. Slurries cannot contain any toxic or hazardous constituents.
7. Slurries discharged to land must not adversely affect the quality or beneficial uses of underlying groundwater.
8. Slurries must be removed and disposed of at an appropriate disposal facility prior to restoring the storage area or sump to pre-discharge conditions.
9. The storage area or sump must be filled in and restored to pre-discharge conditions.
10. Discharger must submit a Notice of Intent or technical and/or monitoring program reports when directed by the San Diego Water Board.

**9.II.A. Specific Waiver Conditions for Discharge of Drilling Muds**

1. Drilling mud cannot be from borings advanced for a soil or groundwater contamination investigation.

This page left intentionally blank

## **CONDITIONAL WAIVER NO. 10 – DISCHARGES OF EMERGENCY/DISASTER RELATED WASTES**

Conditional Waiver No. 10 is for discharges of wastes resulting from an emergency or disaster, which may be a source of pollutants that can adversely affect the quality of waters of the state.

The following types of discharge not regulated or authorized under waste discharge requirements (WDRs) may be eligible for Conditional Waiver No. 10:

- Incidental discharges of oil and oily water within a response area during an oil spill response in marine waters
- Discharges of disaster related wastes to temporary waste piles and surface impoundments
- Discharges of mass mortality wastes temporary waste piles and emergency landfills
- Other discharges of emergency/disaster related wastes

In order to be eligible for Conditional Waiver No. 10, discharges must comply with certain conditions to be protective of water quality. Waiver conditions applicable to emergency/disaster related waste discharges include the following:

- 10.I.A. General Waiver Conditions for Discharges of Emergency/Disaster Related Wastes
- 10.II.A. Specific Waiver Conditions for Incidental Discharges During an Oil Spill Response
- 10.II.B. Specific Waiver Conditions for Disaster Related and Mass Mortality Wastes Disposed at Regulated Waste Disposal Facilities
- 10.II.C. Specific Waiver Conditions for Disaster Related and Mass Mortality Wastes Discharged to Temporary Waste Piles Located at Regulated Waste Disposal Facilities
- 10.II.D. Specific Waiver Conditions for Disaster Related Wastes Discharged to Temporary Waste Piles NOT Located at Regulated Waste Disposal Facilities
- 10.II.E. Specific Waiver Conditions for Disaster Related Wastes Discharged to Temporary Surface Impoundments NOT Located at Regulated Waste Disposal Facilities
- 10.II.F. Specific Waiver Conditions for Mass Mortality Wastes Discharged to Emergency Landfills NOT Located at Regulated Waste Disposal Facilities

Discharges of emergency/disaster related wastes that comply with the general and specific waiver conditions in Conditional Waiver No. 10 should minimize the potential impact and should not pose a significant threat to the quality of waters of the state.

### **10.I.A. General Waiver Conditions for Discharges of Emergency/Disaster Related Wastes**

1. This conditional waiver does not become active and available until one of the following occurs:
  - a) The Governor of California issues a proclamation, pursuant to Government Code sections 8625 and 8558(b), identifying a portion of the San Diego Region as being in a state of emergency, and applies only to disaster related waste streams from disaster-impacted areas; or

- b) An oil spill incident occurs in the marine waters of the San Diego Region requiring a response authorized by the Administrator of the Office of Spill Prevention and Response; or
  - c) A discharge occurs resulting from emergency activities that are waived of the requirements of Water Code sections 13260(a) and (c), 13263(a), and 13264(a), which are described in Water Code section 13269(c)(1) and (2).
2. This conditional waiver is only in effect temporarily and shall expire under the following conditions:
- a) The state of emergency declared by the Governor expires, or
  - b) The San Diego Water Board takes action to terminate enrollment of individual or all dischargers/Units temporarily granted a waiver, or
  - c) Six (6) months has elapsed since the Governor issued a declaration of the State of emergency for any portion of the San Diego Region, or the oil spill incident occurred, or emergency activities began, unless otherwise directed by the San Diego Water Board.
3. Emergency/disaster related waste management and cleanup activities must minimize or eliminate the discharge of any pollutants that could adversely affect the quality or beneficial uses of the waters of the state.
4. For all temporary waste piles and surface impoundments used to manage emergency/disaster related waste, the following conditions apply:
- a) Prevent the direct or indirect discharge of emergency/disaster related wastes to any surface waters of the state (including ephemeral streams and vernal pools).
  - b) Emergency/disaster related waste management operations shall not be performed in a manner that creates, or contributes to a condition of pollution or nuisance.
  - c) Emergency/disaster related waste management operations shall not be performed in a manner that creates, or contributes to conditions which violate the waste discharge prohibitions promulgated in the Basin Plan.
  - d) Emergency/disaster related wastes shall not be managed in a manner that causes corrosion, decay, or otherwise reduces or impairs the integrity of containment structures at any waste management unit.<sup>11</sup>
  - e) Emergency/disaster related wastes shall not be managed in a manner that mixes or commingles other wastes that can produce a violent reaction (including heat, pressure, fire or explosion), that can produce toxic byproducts, or that can produce any reaction products requiring a higher level of containment, or results in the mixture being classified as a restricted waste.<sup>12</sup>
  - f) Liquid hazardous wastes or "restricted hazardous wastes"<sup>13</sup> cannot be discharged to municipal solid waste (MSW) landfills, temporary waste piles, or temporary surface impoundments.
  - g) Temporary waste piles must be covered to adequately prevent rainwater infiltration and runoff, and control fugitive dust, vectors, odors, blowing litter and scavenging. The cover shall not consist of or contain material classified as a designated waste.<sup>14</sup>

---

<sup>11</sup> Pursuant to California Code of Regulations Title 27 section 20200(b)(1)

<sup>12</sup> Pursuant to California Code of Regulations Title 27 section 20200(b)(2)

<sup>13</sup> Defined in California Health and Safety Code section 25122.7

<sup>14</sup> Defined in California Code of Regulations Title 27 section 20210

- h) Inert wastes<sup>15</sup> that are suitable for reuse or recycling do not require permanent disposal at a classified waste management or disposal facility (i.e., permitted landfill).
- i) Waste streams must only originate from disaster-impacted areas of the San Diego Region. These waste streams shall be discharged for treatment and permanent disposal **only** into:
  - i) Waste management or treatment units (e.g., liquid wastes into wastewater treatment plants) as allowed by waste discharge requirements (WDRs) issued by the San Diego Water Board, or
  - ii) Solid waste management units or disposal facilities (e.g., solid wastes into Class III MSW landfills underlain with engineered composite liners and leachate collection systems and that satisfy the requirements of State Water Board Resolution No. 93-62); or
  - iii) Emergency landfills established in accordance with the conditions of this waiver; and
  - iv) As allowed by valid WDRs issued by the San Diego Water Board for other categories of waste management units.

**10.II.A. Specific Waiver Conditions for Incidental Discharges During an Oil Spill Response**

- 1. Incidental discharges<sup>16</sup> are confined to the response area which is defined by the daily work plan approved under the Incident Command System or Unified Command Structure by the Administrator, Federal On-Scene Coordinator, or State On-Scene Coordinator.
- 2. Oil spill response must be in marine waters.<sup>17</sup>

**10.II.B. Specific Waiver Conditions for Disaster Related and Mass Mortality Wastes Disposed at Regulated Waste Disposal Facilities**

- 1. Waste (not otherwise suitable for recycling or reuse) derived from cleanup of emergency/disaster-impacted areas in the San Diego Region and managed under provisions of this waiver shall only be discharged *for permanent disposal into units that are underlain with an engineered composite liner system and a leachate collection meeting the requirements of State Water Board Resolution No. 93-62.*
- 2. Wastes derived from cleanup of disaster-impacted areas in the San Diego Region and discharged into regulated waste disposal facilities must be isolated, to the extent practicable, from areas of the facility that are not lined.
- 3. Food wastes, animal carcasses, and other putrescible wastes derived from cleanup of disaster-impacted areas in the San Diego Region shall be discharged for disposal in compliance with conditions of this waiver and covered expeditiously.
- 4. Inert wastes contained in mixed emergency wastes derived from cleanup of disaster-impacted areas in the San Diego Region, shall be separated and recycled when appropriate and practicable.

<sup>15</sup> Defined in California Code of Regulations Title 27 section 20230

<sup>16</sup> "Incidental discharge" is defined as "the release of oil and/or oily water within the response area in or proximate to the area in which the oil recovery activities are taking place during and attendant to oil spill response activities. Incidental discharges include, but are not limited to, the decanting of oily water; in order to conserve oil storage capacity, and the wash down of vessels, facilities, and equipment used in the response."

<sup>17</sup> "Marine waters" defined in Government Code section 8670.3(i) as "those waters subject to tidal influence"

5. The discharger is responsible for accurately classifying disaster related waste streams in accordance with the applicable regulatory requirements.<sup>18</sup>
6. The regulated waste disposal facility owner/operator is responsible for properly identifying disaster related waste streams<sup>19</sup> and identifying wastes that may be suitable for use as alternative daily cover (ADC). Solid wastes that may be used as ADC at a regulated disposal facility are as follows:
  - a) Solid wastes that are classified as inert wastes.
  - b) Solid wastes that meet the criteria for ADC as prescribed in California Code of Regulations Title 27 sections 20690 to 20705, and.
  - c) Other solid wastes identified by the Local Enforcement Agency (LEA) as being suitable for use as ADC; so long as the waste could be accepted at a Class III MSW landfill without special permission from the San Diego Water Board.
7. Disposal of large numbers of animal carcasses, and other high moisture waste streams from mass mortality (e.g., natural disaster, agricultural disease, etc.), may cause wastes to exceed moisture holding capacity at regulated MSW landfills. To limit the impacts from such a large an additional moisture content associated with a mass mortality waste load, the owner/operator responsible for the regulated waste disposal facility should implement the following procedures:
  - a) Discharge high-moisture wastes (animal carcasses, animal related wastes, etc.) only in areas of the composite lined unit with a considerable thickness of other waste.
  - b) Owner/operator must limit the thickness of the high-moisture waste stream (e.g., animal carcasses, animal related wastes, etc.) to no more than 2 feet.
  - c) Owner/operator must cover each layer of high-moisture wastes (e.g., animal carcasses, animal related wastes, etc.) with an even thicker layer of absorbent wastes or soil.
  - d) For disaster related mass mortality wastes streams that are in a liquid form (e.g. raw eggs, etc.) reduce the moisture content prior to discharge by mixing with an absorbent material (e.g., saw dust, mulch, soil, etc.).
8. Within 60 days after the expiration of this waiver (see 10.I.A) the owner/operator of the a regulated waste disposal facility that accepted waste from disaster-impacted areas in the San Diego Region must submit an amendment to their Report of Waste Discharge (RoWD) (Joint Technical Document) describing the material change to their discharge, pertaining to the temporary acceptance, management, and disposal of waste derived from cleanup of disaster-impacted areas of the San Diego Region.

**10.II.C. Specific Waiver Conditions for Disaster Related and Mass Mortality Wastes Discharged to Temporary Waste Piles Located at Regulated Waste Disposal Facilities**

1. Owners/operators of regulated waste management or disposal facilities proposing to accept discharges of waste from disaster-impacted areas in the San Diego Region to a temporary waste staging area located at a regulated facility must submit a Notice of Intent to the San Diego Water Board within 30 days of the initial discharge of any disaster related wastes. The Notice of Intent must contain the name and contact information of the owner/operator of the regulated waste management or

<sup>18</sup> Requirements are provided in California Code of Regulations Title 27, Title 23 Chapter 15, and/or Title 22 Division 4.5.

<sup>19</sup> Pursuant to California Code of Regulations Title 27 section 20200(c)

disposal facility property, facility address and contact information, description of temporary waste management unit, certification, and signature of the owner, operator, and/or authorized representative. The certification must include the statement, "I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment."

2. Owners/operators of regulated waste management or disposal facilities must prevent surface runoff/runon from contacting wastes derived from cleanup of disaster-impacted areas in the San Diego Region and shall prevent erosion and transport of soils containing disaster related wastes or waste constituents by surface runoff from all temporary waste piles. The facility owner/operator must implement management measures (MMs) and/or best management practices (BMPs) for storm water conveyance and control.
3. All wastes derived from disaster-impacted areas in the San Diego Region must be placed at least 5 feet above the highest historically known or anticipated level of groundwater, and more than 100 feet from, and at an elevation that is higher than, any surface water of the state.
4. All waste derived from disaster-impacted areas in the San Diego Region must be protected from flooding and inundation, in compliance with the current WDRs for the affected unit, or units, at the regulated facility.
5. Owners/operators of regulated waste management or disposal facilities must manage temporary waste piles for disaster related mass mortality wastes as follows:
  - a) Temporary waste piles of mass mortality wastes can only be located in areas underlain by a composite liner system (or approved engineering alternative) and a significant thickness of other types of solid wastes.
  - b) Owner/operator must implement a plan to prevent wild animals (e.g., birds, mammals, reptiles, etc.) from coming into contact with mass mortality wastes (e.g., provide and maintain adequate cover for temporary waste piles).
  - c) Owner/operator must ensure that all temporary waste piles containing mass mortality wastes are discharged into landfill prior to the end of the working day, unless sufficient information is provided to demonstrate that a proposed alternative is protective of water quality and human health for a given temporary waste pile.
  - d) Owner/operator must ensure that all mass mortality wastes are covered with soil or other waste immediately after it is discharged into the landfill.
  - e) Owner/operator must ensure that any storm water runoff that comes into contact with the disaster related wastes or containing waste constituents is managed as leachate.
6. Disaster related and mass mortality wastes discharged to temporary waste piles at regulated waste management or disposal facilities temporarily granted a waiver, together with any materials used to contain the temporary waste piles, shall be removed from the site. The site shall be restored to its original state no later than the 60 days after expiration of this waiver (see 10.I.A), or as required by the San Diego Water Board. Alternatively, the facility owner/operator must file an amended RoWD (Joint Technical Document) and obtain amended WDRs from the San Diego

Water Board for any waste piles that will continue to exist past the expiration date of this waiver.

7. Owners/operators of regulated waste management or disposal facilities must submit a Notice of Termination to the San Diego Water Board within 10 working days of completing removal of all disaster related wastes and restoring the site to its original condition. The Notice of Termination must contain the name and contact information of the owner/operator of the regulated facility property, facility address and contact information, description of waste that was temporarily stored/staged in the temporary waste management unit, the final waste disposal location, certification, and signature of the owner, operator, and/or authorized representative. The certification must include the statement, "I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment."

**10.II.D. Specific Waiver Conditions for Disaster Related Wastes Discharged to Temporary Waste Piles NOT Located at Regulated Waste Disposal Facilities**

1. Any agency, jurisdiction or person proposing to establish a temporary waste pile not located at a regulated facility must submit a Notice of Intent to the San Diego Water Board within 30 days of the initial discharge of any disaster related wastes. The Notice of Intent must contain the name and contact information of the owner/operator the property where the temporary waste pile facility is located, facility address and contact information, description of temporary waste management unit, certification, and signature of the owner, operator, and/or authorized representative. The certification must include the statement, "I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment."
2. Owners/operators of temporary waste piles not on regulated facilities must ensure that they are sited, designed, constructed, operated, and maintained to ensure compliance the following minimum prescriptive and performance standards:
  - a) The bottom of a temporary waste pile must be placed at least 5 feet above the highest historically known or anticipated level of groundwater, and more than 100 feet from, and at an elevation that is higher than, any surface water of the state.
  - b) Temporary waste piles must be protected from inundation or washout due of floods with a 100-year return period.
  - c) Temporary waste piles cannot be located on a known Holocene fault.
  - d) Temporary waste piles cannot be located in areas of potential rapid geologic change (e.g., landslides, debris flows, flashflood areas, etc.).
  - e) Temporary waste piles must be underlain by a temporary impermeable barrier (e.g., heavy gauge plastic) or located in an area covered by a relatively impermeable surface (e.g., asphalt, concrete, etc.). The liner must be installed prior to establishing a temporary waste pile to protect all natural geological materials from contact with the waste and from contact with leachate.

- f) Temporary waste piles must be covered daily with either a heavy gage plastic or material that meets the classification criteria for inert wastes. A material that would be classified as a designated waste cannot be utilized for daily cover at a temporary waste staging area. Cover on the temporary waste piles must be designed, installed and maintained to prevent rainwater infiltration and runoff, and control of fugitive dust, vectors, odors, blowing litter and scavenging.
- g) Temporary waste management operations that include wastes with a liquid content exceeding its moisture-holding capacity and/or containing free liquids, shall comply with requirements for temporary surface impoundments (see 10.II.E).
- h) Temporary waste piles must be designed, constructed and operated to limit, to the greatest extent possible, ponding, infiltration, inundation, erosion, slope failure, and washout. Surface drainage from outside of the temporary waste pile shall be diverted from the location of the temporary waste pile through implementation of MMs/BMPs for storm water control and conveyance.
- 3. Owners/operators of temporary waste piles not on regulated facilities must submit written notification to the San Diego Board at least 30 days prior to initiating the discharge of return water or ponded water contained within the temporary waste pile if the discharge is to a location other than a sanitary sewer system. Based on the San Diego Water Board determination, the discharger may receive: 1) WDRs; 2) a waiver of WDRs, or 3) written determination that the disposal of the return water or ponded water is not subject to regulation by the San Diego Water Board.
- 4. Owners/operators of temporary waste piles not on regulated facilities must post at least one clearly visible sign (in English) listing the following minimum information: a) project name, b) brief project description, and c) operator name and phone number. The discharger must post additional signs as necessary (in languages other than English) to more effectively communicate the minimum contact information (listed above) to the local community. The sign(s) shall be maintained as required to keep them legible and shall remain in place while temporary waste piles remain on site.
- 5. Solid wastes discharged to temporary waste piles not at regulated waste management or disposal facilities temporarily granted a waiver, together with any materials used to contain the temporary waste piles, shall be removed from the site. The site shall be restored to its original state no later than the 60 days after expiration of this waiver (see 10.I.A), or as required by the San Diego Water Board.
- 6. Owners/operators of temporary waste piles not on regulated facilities must submit a Notice of Termination to the San Diego Water Board within 10 working days of completing removal of all disaster related wastes and restoring the site to its original condition. The Notice of Termination must contain the name and contact information of the owner/operator the property where the temporary waste pile facility was located, facility address and contact information, description of waste that was temporarily stored/staged in the temporary waste management unit, the final waste disposal location, certification, and signature of the owner, operator, and/or authorized representative. The certification must include the statement, "*I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there*

are significant penalties for submitting false information, including the possibility of fine and imprisonment.”

**10.II.E. Specific Waiver Conditions for Disaster Related Wastes Discharged to Temporary Surface Impoundments NOT Located at Regulated Waste Disposal Facilities**

1. Any agency, jurisdiction or person proposing to establish a temporary surface impoundment not located at a regulated facility must submit a Notice of Intent to the San Diego Water Board within 30 days of the initial discharge of any disaster related wastes. The Notice of Intent must contain the name and contact information of the owner/operator the property where the temporary surface impoundment facility is located, facility address and contact information, description of temporary waste management unit, certification, and signature of the owner, operator, and/or authorized representative. The certification must include the statement, “I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.”
2. Owners/operators of temporary surface impoundments not on regulated facilities must ensure that they are sited, designed, constructed, operated, and maintained to ensure compliance the following minimum prescriptive and performance standards:
  - a) The bottom of a temporary surface impoundment must be placed at least 5 feet above the highest historically known or anticipated level of groundwater, and more than 100 feet from, and at an elevation that is higher than, any surface water of the state.
  - b) Temporary surface impoundments must be protected from inundation or washout due of floods with a 100-year return period.
  - c) Temporary surface impoundments cannot be located on a known Holocene fault.
  - d) Temporary surface impoundments cannot be located in areas of potential rapid geologic change (e.g., landslides, debris flows, flashflood areas, etc.).
  - e) Temporary surface impoundments must be underlain by a temporary impermeable barrier (e.g., heavy gauge plastic) or a relatively impermeable surface (e.g., asphalt, concrete, etc.). The liner must be installed prior to establishing a temporary surface impoundment to protect all natural geological materials from contact with the waste.
  - f) Berms and containment structures of temporary surface impoundments must be composed of inert materials that will not cause adverse reactions (e.g., corrosion, decay, or otherwise reduce or impair the integrity of the containment structure) when placed in contact with the liquid wastes stored within the temporary surface impoundment.
  - g) Temporary surface impoundments must be designed, operated and maintained to ensure that liquid wastes are at least 2 feet below the top of the impoundment (measured vertically from the surface of the liquid up to the point on the surrounding lined berm or dike having the lowest elevation), and must be designed and constructed to prevent overtopping as a results of wind conditions likely to accompany precipitation conditions.

- h) Direct pipeline discharges of liquid can occur only into temporary surface impoundments with automatic or manually operated fail-safe systems to prevent overfilling.
- i) Temporary surface impoundments must be designed and constructed to prevent scouring of containment structures at points of liquid discharge into the impoundments.
- j) Temporary surface impoundments must be designed, constructed and operated to limit, to the greatest extent possible, inundation, erosion, slope failure, and washout. Surface drainage from outside of the temporary surface impoundments shall be diverted from the location of the temporary waste pile through implementation of MMs/BMPs for storm water control and conveyance.
- 3. Owners/operators of temporary surface impoundments not on regulated facilities must submit written notification to the San Diego Board at least 30 days prior to initiating the discharge of return water or ponded water contained within the temporary waste pile if the discharge is to a location other than a sanitary sewer system. Based on the San Diego Water Board determination, the discharger may receive: 1) WDRs; 2) a waiver of WDRs, or 3) written determination that the disposal of the return water or ponded water is not subject to regulation by the San Diego Water Board.
- 4. Owners/operators of temporary surface impoundments not on regulated facilities must ensure that only disaster related waste streams are discharged into temporary surface impoundments.
- 5. All visible portions of synthetic liner systems in temporary surface impoundments must be inspected weekly, or daily as necessary, until all free liquid is removed from the surface impoundment as part of closure.<sup>20</sup> If, during the active life of the temporary surface impoundment, the wastes are removed and the bottom of the impoundment is cleaned down to the liner, an inspection shall be made of the bottom of the liner prior to refilling the impoundment.
- 6. Owners/operators of temporary surface impoundments not on regulated facilities must post at least one clearly visible sign (in English) listing the following minimum information: a) project name, b) brief project description, and c) operator name and phone number. The facility owner/operator must post additional signs as necessary (in languages other than English) to more effectively communicate the minimum contact information (listed above) to the local community. The sign(s) shall be maintained as required to keep them legible and shall remain in place while temporary surface impoundments remain on site.
- 7. Solid wastes discharged to temporary surface impoundments not at regulated waste management or disposal facilities, together with any materials used to contain the temporary surface impoundments, shall be removed from the site. The site shall be restored to its original state no later than the 60 days after expiration of this waiver (see 10.I.A), or as required by the San Diego Water Board.
- 8. Owners/operators of temporary surface impoundments not on regulated facilities must submit a Notice of Termination to the San Diego Water Board within 10 working days of completing removal of all disaster related wastes and restoring the site to its original condition. The Notice of Termination must contain the name and contact information of the owner/operator the property where the temporary

---

<sup>20</sup> Pursuant to California Code of Regulations Title 27 section 21400(a)

surface impoundment facility was located, facility address and contact information, description of waste that was temporarily stored/staged in the temporary waste management unit, the final waste disposal location, certification, and signature of the owner, operator, and/or authorized representative. The certification must include the statement, "I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment."

**10.II.F. Specific Waiver Conditions for Mass Mortality Wastes Discharged to Emergency Landfills NOT Located at Regulated Waste Disposal Facilities**

1. Any agency, jurisdiction or person proposing to establish an emergency landfill not located at a regulated facility must submit a Notice of Intent to the San Diego Water Board within 30 days of the initial discharge of any disaster related wastes. The Notice of Intent must contain the name and contact information of the owner/operator the property where the emergency landfill facility is located, facility address and contact information, description of emergency waste management unit, certification, and signature of the owner, operator, and/or authorized representative. The certification must include the statement, "I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment."
2. Owners/operators of emergency landfills not on regulated facilities must ensure that they are sited, designed, constructed, operated, and maintained to ensure compliance the following minimum prescriptive and performance standards:
  - a) The bottom of an emergency landfill must be placed at least 10 feet above the highest historically known or anticipated level of groundwater, and more than 500 feet from any surface water of the state.
  - b) Emergency landfills must be protected from inundation or washout due of floods with a 100-year return period.
  - c) Emergency landfills cannot be located on a known Holocene fault.
  - d) Emergency landfills cannot be located in areas of potential rapid geologic change (e.g., landslides, debris flows, flashflood areas, etc.).
  - e) Emergency landfills cannot be located in areas underlain by fractured bedrock aquifer or highly permeable soils (e.g., gravels, sands, and loamy sands) or in facilities that are characterized by such deposits (e.g., gravel quarry).
  - f) For disaster related mass mortality wastes streams that are in a liquid form (e.g. raw eggs, etc.) reduce the moisture content prior to discharge by mixing with an absorbent material (e.g., saw dust, mulch, soil, etc.).
  - g) The thickness of each layer of mass mortality wastes must be limited to less than 2 feet.
  - h) Lime (or another liquid abatement material) must be added to each layer to help reduce the generation of liquid by the mass mortality wastes.

- i) Each layer of lime-covered mass mortality wastes must be covered by at least 3 feet of soil before adding another layer of mass mortality wastes.
  - j) Mass mortality wastes must be discharged for disposal in compliance with the conditions of this waiver and covered at the end of each working day
  - k) The final layer of disaster related mass mortality wastes discharged into the emergency landfill must be overlain by a final layer of not less than 3 feet of soil; or alternatively the unit may be covered by a relatively impermeable engineered surface (e.g., asphalt, concrete, etc.). The final soil layer shall be placed in a mound configuration so that the final soil layer: 1) Overlaps the mass mortality wastes by several feet on each edge of the emergency landfill; 2) is at least 3 feet thick over all portions of the mass mortality wastes; and 3) is sloped to provide good drainage that does not impair the integrity of the emergency landfill.
  - l) Owner/operator should also evaluate, implement, and document other effective waste isolation (and waste moisture reducing methods) in conjunction with the procedures identified above
3. The emergency landfill must be designed, constructed and operated to limit, to the greatest extent possible, ponding, infiltration, inundation, erosion, slope failure, and washout. The owner/operator must protect the integrity of the final cover from adverse impacts by erosion by installing and maintaining MMs/BMPs, including:
- a) Installation of runoff control features on the upgradient side of the emergency landfill to divert offsite storm water from the emergency landfill.
  - b) Installation of an effective runoff collection and conveyance ditch.
  - c) Grading and maintenance of the final cover to eliminate ponding of water over the emergency landfill.
  - d) Installation and maintenance of erosion control measures on the cover of the emergency landfill (e.g., install straw mulch and/or a vegetative cover).
  - e) Installation of a deer fence around the perimeter of the emergency landfill to discourage access by digging of carnivores.
4. Owners/operators of emergency landfills not on regulated facilities must post at least one clearly visible sign (in English) listing the following minimum information: a) clearly identify the area as an emergency landfill for animal and agricultural wastes, b) a warning against trespass, c) a description of the reason for the emergency landfill (e.g., Exotic Newcastle, Avian Flu, etc.), the type(s) of waste buried at the site (e.g., types of carcasses, egg wastes, manure, etc.), and d) the name and telephone number of the current property owner. The facility owner/operator must post additional signs as necessary (in languages other than English) to more effectively communicate the minimum contact information (listed above) to the local community. The sign(s) shall be maintained as required to keep them legible and shall remain in place while the emergency landfill remains on site.
5. Owners/operators of emergency landfills not on regulated facilities must submit Notice of Termination to the San Diego Water Board within 10 working days of completing removal of all disaster related wastes and restoring the site to its original condition. The Notice of Termination must contain the name and contact information of the owner/operator the property where the temporary waste pile facility was located, facility address and contact information, description of waste that was temporarily stored/staged in the temporary waste management unit, the final waste disposal location, certification, and signature of the owner, operator, and/or authorized representative. The certification must include the statement, "I certify

under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.”

6. Owners/operators of emergency landfills not on regulated facilities must submit a RoWD to the San Diego Water Board and apply for WDRs (using Form 200). The RoWD and application for WDRs must be provided to the San Diego Water Board within 6 months of creating the emergency landfill for disposal of disaster related mass mortality wastes. At a minimum, the RoWD shall include the following information:
- a) A short description of the emergency conditions that made the emergency landfill necessary.
  - b) The identity, physical address, mailing address and telephone number of the current land owner.
  - c) Photographs taken to document the location of the emergency landfill, practices used for placement of wastes and soil layers, and the appearance of the emergency landfill after installation of the final cover.
  - d) A map showing the location and perimeter of the emergency landfill, its location relative to local topographical, geographical, biological, and cultural features (e.g. roads, streams, etc.), and provide Geographical Information System (GIS) data as available.
  - e) A simple cross section of the emergency landfill and a description of the construction (depth, thickness of layers and final cover).
  - f) An estimate of the amount of wastes (e.g., in pounds or tons) discharged into the emergency landfill.
  - g) A description of measures taken to ensure that wastes and waste constituents do not migrate outside the emergency landfill.
  - h) Any other site-specific or discharger related information requested by the San Diego Water Board.

**CONDITIONAL WAIVER NO. 11 – AERIALLY DISCHARGED WASTES OVER LAND**

Conditional Waiver No. 11 is for discharges of wastes that have been discharged aerially over land, which may be a source of pollutants that can adversely affect the quality of waters of the state.

The following types of discharge not regulated or authorized under waste discharge requirements (WDRs) may be eligible for Conditional Waiver No. 11:

- Discharges of wastes related to fireworks displays over land
- Other wastes discharged aerially over land that may adversely affect the quality of the waters of the state, but determined to be “low threat” by the San Diego Water Board

In order to be eligible for Conditional Waiver No. 11, discharges must comply with certain conditions to be protective of water quality. Waiver conditions applicable to wastes discharged aerially over land include the following:

11.I.A. General Waiver Conditions for Aerially Discharged Wastes Over Land

11.II.A. Specific Waiver Conditions for Discharges of Waste Related to Fireworks Displays Over Land

Wastes discharged aerially over land that comply with the general and specific waiver conditions in Conditional Waiver No. 11 are not expected to pose a threat to the quality of waters of the state.

**11.I.A. General Waiver Conditions for Aerially Discharged Wastes Over Land**

1. Aerially discharged wastes cannot be discharged directly over and/or into surface waters of the state (including ephemeral streams and vernal pools).
2. Aerially discharged wastes must not cause or threaten to cause a condition of contamination, pollution, or nuisance.
3. Aerially discharged wastes must not impact the quality of groundwater in any water wells or surface water in any drinking water reservoirs.
4. Dischargers must comply with any local, state, and federal ordinances and regulations and obtain any required approvals, permits, certifications, and/or licenses from authorized local agencies.
5. Discharger must submit a Notice of Intent or technical and/or monitoring program reports when directed by the San Diego Water Board.

**11.II.A. Specific Waiver Conditions for Discharges of Waste Related to Fireworks Displays Over Land**

1. No more than one fireworks display may be conducted from a launch site or within 1.0 mile of another launch site within a 48-hour period.<sup>21</sup> If the organizer will have more than one fireworks display within a 48-hour period, the organizer must file a Notice of Intent containing information about the fireworks to be used, location of launch area and nearby water bodies and groundwater basins, surrounding land

---

<sup>21</sup> This condition is intended to alleviate spatial and temporal accumulation of fireworks-related chemical contaminants.

- uses, planned period of and frequency of discharge, copies of any permits obtained from other public agencies, and measures that will be taken to minimize or eliminate the discharge of pollutants that might affect surface water and groundwater quality. Sufficient information must be submitted before the discharge may begin.
2. All fireworks-related debris must be cleaned up from land surface areas.
  3. Launch areas and deposition areas of fireworks displays may not be located within areas designated as Zone A for groundwater source area protection, as defined by the California Department of Public Health's Drinking Water Source Assessment Protection Program. This condition may be waived if the owner or operator of a groundwater drinking water source, through a permit, specifically allows the fireworks display launch area and/or deposition area within an area designated as Zone A for groundwater source area protection.
  4. Launch areas and deposition areas of fireworks displays may not be located within areas designated as Zone A for surface water source protection, as defined by the California Department of Public Health's Drinking Water Source Assessment Protection Program. This condition may be waived if the owner or operator of a surface water source reservoir or intake structure, through a permit, specifically allows the fireworks display launch area and/or deposition area within an area designated as Zone A for surface water protection.
  5. The fireworks display must be permitted by all relevant public agencies that require permits for fireworks displays (e.g., fire departments, municipal governments, law enforcement, water supply agencies). Copies of any permits must be available on site for inspection.
  6. The San Diego Water Board and/or other local regulatory agencies must be allowed reasonable access to the site in order to perform inspections and conduct monitoring

**V. DESCRIPTION OF DISCHARGE**

Describe the discharge (i.e., source(s) of discharge, pollutants of concern, period and frequency, etc.). Use additional pages as needed. Provide a map of the property/facility if necessary.

**VI. DESCRIPTION OF MANAGEMENT MEASURES AND BEST MANAGEMENT PRACTICES**

Describe what management measures (MMs) and best management practices (BMPS) will be implemented to minimize or eliminate the discharge of pollutants to waters of the state. Use additional pages as needed. Provide a map of the property/facility showing locations of MMs/BMPs if necessary.

**VII. ADDITIONAL INFORMATION**

Please provide additional information, as needed or required, about the discharge and/or how the discharger intends to comply with the waiver conditions of the conditional waiver. Use additional pages as needed.

**VIII. CERTIFICATION**

I certify under penalty of law that I have personally examined and am familiar with the information submitted in this document and all attachments and that, based on my inquiry of those individuals immediately responsible for obtaining the information, I believe that the information is true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment.

## NOTICE OF TERMINATION

# Title

**V. INERT WASTE SOIL CHARACTERIZATION**

|   |  |  |
|---|--|--|
| <u>Name of Certified Analytical Laboratory:</u>   |  |  |
| <u>Certified Analytical Laboratory Contact:</u>   |  |  |
| <u>Certified Analytical Laboratory Address:</u>   |  |  |
| <u>City:</u>  | <u>County:</u>                                   | <u>State:</u> <u>Zip:</u>                        |
| <u>Telephone:</u>   | <u>Fax:</u>                                      | <u>Email:</u>                                    |
| <u>Number of samples collected for characterization:</u>  |  |  |
| <input type="checkbox"/> <u>Mark the box (☒) to confirm that no samples collected to characterize waste soil as inert contained detectable concentrations of constituents other than Title 22 metals, as required by waiver condition 8.II.F.1.i.</u> |  |  |
| <b><u>Title 22 Metals<br/>Contaminant of Concern</u></b>  | <b><u>EPA Approved<br/>Analytical Method</u></b> | <b><u>90% UCL Concentration<br/>(mg/kg)*</u></b> |
|   |  |  |
|   |  |  |
|   |  |  |
|   |  |  |
|   |  |  |
|   |  |  |

*Use additional pages if there are additional contaminants of concern. Attach copy of laboratory analytical report.*

*\* If molybdenum, silver, and/or zinc exceed the Tier 2 SSLs, then the waiver does not apply and a Report of Waste Discharge (RoWD) must be submitted to the San Diego Water Board.*

**VI. ENROLLMENT FOR REUSE OF TIER 1 or TIER 2 INERT WASTE SOIL**

Mark the box (☒) next to the tier that the inert waste soil has been characterized, as supported with data provided in section V.

|   |  |
|---|--|
| <input type="checkbox"/> <b><u>Tier 1 (Complete section X)</u></b><br><u>Management of Tier 1 inert waste soils must comply with waiver conditions 8.II.F.1 and 8.II.F.2.</u> | <input type="checkbox"/> <b><u>Tier 2 (Complete sections VII through X)</u></b><br><u>Management of Tier 2 inert waste soils must comply with waiver conditions 8.II.F.1 and 8.II.F.3.</u> |
|---|--|

**VII. TIER 2 INERT WASTE SOIL IMPORT SITE INFORMATION**

|   |  |
|---|--|
| <u>Import Site Property Owner Name:</u>   |  |
| <u>Import Site Address:</u>   |  |
| <u>City:</u>  | <u>County:</u> <u>State:</u> <u>Zip:</u> |
| <u>Telephone:</u>   | <u>Fax:</u> <u>Email:</u>                |
| <u>Assessor Parcel Number(s):</u>   | <u>Hydrologic Area/Subarea:</u>          |
| <u>Provide a map of the import site showing the location of the nearby surface water bodies and/or water wells, and approximate depth to groundwater.</u> |  |

**VIII. DESCRIPTION OF IMPORT SITE BEST MANAGEMENT PRACTICES**

Describe what management measures (MMs) and best management practices (BMPS) were implemented at the import site to minimize or eliminate the discharge of pollutants to waters of the state. Use additional pages as needed. Provide a map of the property/facility showing locations of MMs/BMPs if necessary.

**IX. PROPERTY OWNER ACKNOWLEDGMENT**

Mark all the boxes (☒) to acknowledge that the applicable Tier 2 inert waste soil waiver conditions have been or will be met:

- ☐ Import site is designated for commercial or industrial land use.
- ☐ Inert waste soil placed at least 5 feet above highest historically known or anticipated level of groundwater.
- ☐ Soil that separates inert waste soil from groundwater has clay content greater than 5 percent and/or in situ permeability of less than  $10^{-5}$  cm/sec.
- ☐ Inert waste soil placed at least 100 feet from the nearest surface water body.
- ☐ Inert waste soil is protected against 100-year peak storm flows as defined by the county flood control agency.
- ☐ Inert waste soil covered by either: 1) engineered materials (e.g. used as road base, fill beneath buildings, bridge abutments), or 2) not less than 2 feet of noncontaminated, clean fill. The cover has a permeability of no more than  $10^{-5}$  cm/sec.
- ☐ Placement of a cover on the inert waste soils completed within 30 days of discharging the final load of inert waste soils at the import site.

I acknowledge the receipt or planned receipt of the waste soil described in sections V and VI and that the soil will be managed pursuant to the restrictions set forth in waiver conditions 8.II.F.3.

**~~APPENDIX D~~**

**~~CONDITION(S) FOR CONDITIONAL WAIVER OF WASTE DISCHARGE REQUIREMENTS OF ITEMS IN TABLE 4-4~~**

**~~CONDITIONS FOR ITEM 21. SHORT-TERM USE OF RECLAIMED WATER:~~**

- ~~1. Short-term water reclamation projects are projects that last one year or less. Short-term projects can include temporary use of reclaimed water for dust control, soil compaction, green belt irrigation, or any other temporary reuse project authorized by the Executive Officer, for which no permanent physical reclaimed water facilities or structures are installed; and~~
- ~~2. The reclaimed water producer must submit a written request for a waiver to the Regional Board. This request must include written notification from the local health department or the State Department of Health Services that the proposed project complies with all local and State health requirements for reclaimed water use and Title 22, Division 4, Chapter 3, Reclamation Criteria, Articles 1 – 10. This written notification shall also specify any monitoring required to demonstrate compliance with Title 22, Division 4, Chapter 3, Articles 2, 3, 4, 5, and 5.1. A new written request for a waiver must be submitted to the Regional Board if the temporary project exceeds one year. New written requests must be received 60 days prior to expiration of the one year project. If no new request is received the short-term project must cease immediately.~~

**~~CONDITIONS FOR ITEM 19. TEMPORARY DISCHARGE OF SPECIFIED CONTAMINATED SOILS:~~**

~~a. General Conditions for All Temporary Waste Piles~~

- ~~(1) **Required Notification of the Regional Board:** The discharger shall send the Regional Board a signed/completed certification report (Section A: Temporary Waste Pile Waiver Certification Form), **within 30 days** of the initial discharge of any waste piles established under this waiver. The discharger shall send the Regional Board a signed/completed certification report (Section B: Temporary Waste Pile Waiver Certification Form) **within 10 working days** of completing removal of all waste and restoring the site to its original condition.~~
- ~~(2) This waiver specifically does not apply to hazardous waste, as defined in Section 66261.3, Division 4.5, Title 22 of the California Code of Regulations, or as amended.~~
- ~~(3) **Prohibitions:** The discharge of waste shall not:~~
  - ~~a. Cause the occurrence of coliform or pathogenic organisms in waters pumped from the basin;~~

- ~~b. Cause the occurrence of objectionable tastes and odors in water pumped from basin;~~
- ~~c. Cause waters pumped from the basin to foam;~~
- ~~d. Cause the presence of toxic materials in waters pumped from the basin;~~
- ~~e. Cause the pH of waters pumped from the basin to fall below 6.0 or rise above 9.0;~~
- ~~f. Cause pollution, contamination or nuisance or adversely affect beneficial uses of ground or surface waters of the hydrologic subareas established in the Basin Plan.~~
- ~~g. Cause a violation of any discharge prohibitions in the Basin Plan for the San Diego Region.~~

~~(4) **Site Conditions:** All parcels of land/property containing a temporary discharge of solid wastes, temporary waste piles as identified in the specific conditions of this waiver, shall meet the following minimum general site conditions:~~

- ~~a. Runon/Runoff Protection: Surface drainage shall be diverted from the temporary waste piles. For all waste piles, the dischargers shall implement effective Best Management Practices (BMPs) to prevent surface water runon and runoff from contacting wastes and to prevent erosion and transport of wastes by surface runoff.~~
- ~~b. Groundwater Protection: All waste piles shall be placed at least five feet above the highest anticipated level of groundwater.~~
- ~~c. Surface Water Protection: All waste piles established under this waiver shall be located not less than 100 feet from any surface water identified in the Basin Plan.~~
- ~~d. Flood Plain Protection: All waste piles shall be protected against 100-year peak stream flows as defined by the County flood control agency.~~

~~(5) **Inspection and Maintenance:** Wastes discharged to waste piles established under this waiver, together with any containment materials used at the temporary waste pile, and any underlying geologic materials contaminated by the discharge, shall be removed within the maximum time period allowed under the applicable Special Conditions. Subsequently the site shall be restored to its original state within 30 days following the removal of all treatment facilities, related equipment, etc. and shall be disposed of or stored in accordance with applicable regulations.~~

~~(6) **Clean Closure Required:** Wastes discharged to waste piles established under this waiver, together with any containment materials used at the temporary waste pile, and any underlying geologic materials contaminated by the discharge, shall be removed within the~~

~~maximum time period allowed under the applicable special conditions. Subsequently, the discharger shall remove all wastes, treatment facilities, related equipment, and dispose of those items in accordance with applicable regulations. The site shall be restored to its original state within maximum time period allowed under the applicable special conditions.~~

~~(7) **Management of Return or Ponded Water:** If return water or ponded water contained within the treatment or storage area of the temporary waste pile will be disposed of at a location other than to a sanitary sewer system, then the discharger shall submit written notification to the Executive Officer prior to initiating the discharge and either: 1) obtain waste discharge requirements; 2) obtain a waiver of waste discharge requirements or 3) obtain a written determination from the Regional Board Executive Officer that the disposal of the return water or ponded water is not subject to regulation by the Regional Board.~~

~~(8) **Property Owner Acknowledgment:** By written correspondence to the Regional Board Executive Officer, the property owner shall approve the placement of the waste (temporary waste piles) at the site.~~

~~(9) **Public Notification Requirement:** The discharger shall post at least one clearly visible, sign (in english) listing the following minimum information: a.) project name, b.) name and address of discharger, c.) brief project description, and d.) 24-hour contact information — name, address, facsimile, and telephone number for the project. The discharger shall post additional signs as necessary (in languages other than english) to more effectively communicate the minimum contact information (listed above) to the local community. The sign(s) shall be maintained as required to keep them legible and remain in place while temporary waste piles remain on site.~~

~~(10) All sampling and analytical procedures, including documentation of waste characterization, shall be in accordance with the indicated methods described in *Test Methods for Evaluating Solid Waste, Physical/Chemical Methods*, SW-846, U.S. Environmental Protection Agency (current edition). Reported concentrations levels shall be mean average, with an 80% upper confidence interval, and the total range within each constituent.~~

~~(11) **Obligation to Comply:** This waiver from waste discharge requirements (WDRs) does not relieve dischargers of the obligation to comply with any other applicable local, state and federal requirements.~~

~~(12) **Relation of this Conditional Waiver to Other Authority of the RWQCB:** This action waiving the issuance of WDRs is conditional, may be terminated for any type of discharge at any time, does not permit an illegal discharge, and does not preclude the Regional Board from administering enforcement remedies pursuant to Section 13304 of the California Water Code. Where the staff of this Regional Board considers the adoption of WDRs for a specific discharge of a type identified herein to be in the public interest, staff will draft tentative waste discharge requirements for consideration by the Regional Board.~~

~~b. Special Conditions Applicable to Waste Piles for Treatment or Storage of Soils Contaminated with Petroleum Hydrocarbons~~

- ~~(1) Temporary waste piles established under this waiver shall be limited to a maximum time period of four months or 90 days.~~
- ~~(2) All solid wastes discharged into temporary waste piles established under the waiver shall be derived from only one source (e.g., unauthorized release site).~~
- ~~(3) **Cover:** All waste piles shall be overlain by plastic sheeting (not less than 10 mils thick) to adequately prevent rainwater infiltration, control fugitive dust, and other nuisances.~~
- ~~(4) All waste piles shall be underlain by either plastic sheeting (not less than 10 mils thick) or a liner of low permeability approved by the Regional Board Executive Officer.~~
- ~~(5) In addition to the general and specific conditions stated herein, waste piles shall conform to applicable provisions in the state's Local Oversight Program (LOP) for Orange, Riverside, or San Diego Counties.~~
- ~~(6) **Site Closure:** Any waste pile established under these Special Conditions for Petroleum Contaminated Soils, together with any containment materials used for the temporary waste pile and underlying geologic materials contaminated by the discharge, shall be removed and the site shall be restored to its original state within 30 days.~~

~~c. Special Conditions Applicable to Waste Piles for Treatment or Storage of Dredge Spoils Contaminated with Heavy Metals~~

- ~~(1) All temporary waste piles established under this waiver shall be limited to a maximum time period of nine months or 210 days.~~
- ~~(2) **Cover:** All waste piles shall be overlain by either a plastic sheeting to adequately prevent rainwater infiltration, control fugitive dust, and other nuisances. Alternative control methods shall be subject to approval by the Regional Board Executive Officer.~~
- ~~(3) **Liner:** All waste piles shall be underlain by plastic sheeting (not less than 20 mils thick) or a liner of lower permeability approved by the Regional Board Executive Officer. The liner and containment facility shall be designed to contain all solid wastes and fluids, and shall be subject to approval by the Regional Board Executive Officer.~~
- ~~(4) **Containment Structures:** Materials used in containment structures shall have the appropriate chemical and physical properties to ensure that such structures do not fail to contain waste because of: the stress of installation, pressure gradients, physical contact with the waste or leachate, or chemical reactions with soil and rock.~~
- ~~(5) **Site Closure:** Any waste pile established under these Special Conditions for Dredge Spoils, together with any containment materials used for the temporary waste pile~~

~~and underlying geologic materials contaminated by the discharge, shall be removed and the site shall be restored to its original state within 60 days.~~

**~~CONDITIONS FOR ITEM 20. COMPOSTING AND PROCESSING, MULCHING, OR GRINDING FACILITIES~~**

**~~A. APPLICABILITY~~**

**~~1. Types of Facilities~~**

- ~~a. Facilities composting Green Waste, Agricultural Waste, Food Processing Waste or Paper Waste~~
- ~~b. Facilities processing, mulching or grinding Green Waste, or Agricultural Waste~~

**~~2. Size of Facilities~~**

- ~~a. Composting and Processing, Mulching, or Grinding Operations Less than Five Hundred (500) Cubic Yards~~

~~The submittal of a report of waste discharge and the issuance of waste discharge requirements are waived for discharges from the following:~~

- ~~(1) Green waste, food processing waste, agricultural waste, or paper waste composting operations that do not exceed five hundred (500) cubic yards at any given time;~~
- ~~(2) Green waste or agricultural waste processing, mulching or grinding operations that do not exceed a total volume of five hundred (500) cubic yards at any given time.~~

- ~~b. Composting and Processing, Mulching, or Grinding Operations Greater than Five Hundred (500) Cubic Yards~~

~~For dischargers who comply with the following *Reporting, Site, Operational, and General Conditions*, the issuance of waste discharge requirements are waived for discharges resulting from the following:~~

- ~~(1) The storage and treatment by composting of greater than five hundred (500) cubic yards at any given time of green waste, food processing waste, agricultural waste, or paper waste, and any additives as approved by the RWQCB; or~~
- ~~(2) The storage and treatment by processing, mulching, or grinding of greater than five hundred (500) cubic yards of green waste, or agricultural waste.~~

**B. REPORTING CONDITIONS**

**1. Report of Waste Discharge**

~~The discharger shall file a report of waste discharge that includes a technical report containing a requirement-by-requirement analysis based on acceptable engineering standards and best management practices, of how the process and physical designs of the facility will ensure compliance with the conditions listed herein. The discharger shall submit a fee pursuant to CCR Title 23, Section 2200 for a Threat to Water Quality and Complexity Rating 3-C, Chapter 15.~~

**2. General Industrial Storm Water Permit**

~~The discharger shall file either a Notice of Intent to comply with the requirements set forth in State Water Resources Control Board (SWRCB) NPDES General Permit No. CAS000001 for the discharge of storm water or submit documentation that the NPDES storm water permit requirements are not applicable to the discharger's facility.~~

**3. Changes in Operation**

~~The discharger shall notify the RWQCB of:~~

- ~~a. any significant change in the nature and quantity of waste composted or processed, area of operation, or season of operation; or~~
- ~~b. termination of operation.~~

**C. SITE CONDITIONS**

**1. Control and Management**

~~All areas upon which green waste, food processing waste, agricultural waste, or paper waste and any feedstock additives are discharged for composting or processing, mulching, grinding, storing and treating shall be designed, constructed and maintained to prevent the degradation of waters of the state. Such facility operations shall be equivalent to the water quality protection achieved through the implementation of the following measures:~~

~~**a. Precipitation**~~

~~All precipitation and surface drainage from outside the compost, process, treatment or storage areas including that collected from roofed areas, and runoff from tributary areas resulting from a 25-year, 24-hour storm shall be diverted away from the such areas.~~

~~**b. Runoff**~~

~~The discharger shall develop and implement a plan to reduce or eliminate the discharge of pollutants into surface waters including storm water. The plan shall describe measures taken to prevent contaminated process water and reduce or eliminate contaminated storm water from being discharged from the site.~~

~~**c. Water Quality Protection**~~

~~All compost, process and storage areas shall be sited where soil characteristics, distance from waste to ground water, and other factors will ensure no impairment of beneficial uses of surface waters or ground waters beneath or adjacent to the facility.~~

~~d. *Stream Flow*~~

~~The facilities shall be protected from inundation or washout by overflow from any stream channel during a 25-year peak stream flow.~~

~~e. *Surface Maintenance*~~

~~If the equipment operating near or on compost, process, storage, or treatment areas produces subsidence, cracking, or otherwise compromises any surface, the discharger shall repair any damaged areas immediately.~~

~~**D. OPERATIONAL CONDITIONS**~~

~~**1. *Additives***~~

~~Dischargers who use additives as defined in this document shall report to the RWQCB's Executive Officer for his approval the type, and quantity of the additive. The use of additives shall comply with the *CONDITIONS* listed in this document.~~

~~**2. *Discharge Specifications***~~

~~The discharge of green waste, food processing waste, agricultural waste, or paper waste for storage and treatment by composting or processing, grinding, or mulching shall not cause or threaten to cause a condition of contamination, pollution or nuisance.~~

~~**3. *Maintenance***~~

~~Containment structures such as embankments, liners or surface impoundments shall be maintained in order to ensure proper performance whenever wastes are discharged.~~

~~**4. *Wet Weather Preparations***~~

~~Prior to the rainy season, the discharger shall conduct a survey of the operation to ensure that the site has been graded and prepared to prevent erosion and to prevent ponding of waste water at any location not designed and operated to retain water.~~

~~**5. *Inspections***~~

~~The discharger shall inspect compost, process, storage and treatment areas for emergence of leachate, ponding, or surface failures such as cracking or subsidence; such inspections shall be frequent enough to ensure compliance with the Conditions of this waiver. If visible leachate, ponding, cracking, or subsidence of surfaces is observed, the discharger shall immediately take necessary measures to maintain the performance standards described in *SITE CONDITIONS C*.~~

~~**E. GENERAL CONDITIONS**~~

~~**1. *Prohibitions***~~

~~The inclusion of the following wastes for treatment by composting or processing under the conditions of this~~

~~waiver are prohibited:~~

- ~~a. municipal solid waste;~~
- ~~b. sludges (including sewage sludge, water treatment sludge, and industrial sludge);~~
- ~~c. septage;~~
- ~~d. liquid wastes, unless specifically approved by the Regional Board;~~
- ~~e. animal waste, except manure when used as an additive;~~
- ~~f. oil and grease; and~~
- ~~g. hazardous, designated, and any other wastes determined by the Regional Board to pose a potential threat to water quality.~~

## **~~2. Entry and Inspection~~**

~~The discharger shall allow the RWQCB, or an authorized representative upon the presentation of credentials and other documents as may be required by law, to:~~

- ~~a. Enter upon the discharger's premises where a conditionally waived facility or activity is located or conducted, or where records must be kept under the conditions of this waiver;~~
- ~~b. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this waiver;~~
- ~~c. Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this waiver; and~~
- ~~d. Sample or monitor at reasonable times, for the purposes of assuring compliance with this waiver or as otherwise authorized by the California Water Code, any substances or parameters at any location.~~

## **~~DEFINITION OF TERMS IN CONDITIONS FOR ITEM 20~~**

**~~GREEN WASTE:~~** Material that consists of or contains waste from plants, including leaves, clippings, cuttings, trimmings of grass, weeds, shrubbery, bushes, or trees, residential or community garden wastes, and untreated wood wastes.

**~~FOOD PROCESSING WASTE:~~** Material that consists of or contains only pre-processed and post-processed waste derived from plants, or foods processed or produced at restaurants, hospitals and food distributors.

**~~AGRICULTURAL WASTE:~~** Material that consists of the plant waste coming directly from an agricultural commodity, and is the product of farms and ranches and by-products processed from these products, as defined in Division 21, Part 2, Chapter 1 Section 58619 of the Food and Agriculture Code. Agricultural waste includes agricultural, floricultural, silvicultural, vermicultural or viticultural products.

**~~PAPER WASTE:~~** Material that consists of nonhazardous paper and paper by-products.

~~**ADDITIVE:** Material that consists of waste or products which are approved by the RWQCB's Executive Officer for mixture with feedstock or treated waste to adjust the moisture level, the carbon to nitrogen ratio, or the porosity of the wastes to create a condition favorable to the processing, or to improve the end product. Additives may include manures, fertilizers, and chemical amendments.~~

~~**DISCHARGER:** Any person who discharges waste which could affect the quality of waters of the state, and includes any person who owns a waste management unit or who is responsible for the operation of a waste management unit pursuant to Title 23, California Code of Regulations, Section 2601.~~

~~**CONDITIONS FOR ITEM 22. PERMANENT RECLAIMED WATER PROJECTS:**~~

- ~~1. The discharger shall submit a report of waste discharge pursuant to Section 13260 or 13522.5 of the California Water Code. This report shall contain sufficient technical information from which the Regional Board can determine if the proposed discharge complies with all applicable reclamation regulations; and~~
- ~~2. The proposed discharge of reclaimed water must be in compliance with the California Code of Regulations, Title 22, Division 4, Chapter 3, Articles 1—10; and~~
- ~~3. The proposed discharge of reclaimed water must be in compliance with the Water Quality Control Plan, San Diego Basin (9); and~~
- ~~4. The report of waste discharge must contain a letter from the local health department of the State Department of Health Services stating that the proposed project complies with all State and local Health requirements for the use of reclaimed water. This letter shall also specify any monitoring required to demonstrate compliance with Title 22, Division 4, Chapter 3, Reclamation Criteria, Articles 2, 3, 4, 5 and 5.1; and~~
- ~~5. Temporary waiver's of waste discharge requirements remain in effect for a project until the Regional Board is able to adopt permanent requirements. The Regional Board will adopt requirements, as appropriate, at the earliest possible opportunity, and in accordance with Regional Board priorities.~~

## **Conditional Waiver No. 2 – “Low Threat” Discharges to Land**

Conditional Waiver No. 2 is for “low threat” discharges to land, which can percolate to groundwater. “Low threat” discharges include liquid wastes containing pollutant concentrations that are not expected to adversely impact the quality of waters of the state under ambient conditions. “Low threat” discharges may include potable water or uncontaminated groundwater. Potable water and uncontaminated groundwater are not considered waste when initially discharged. However, when it comes into contact with pollutants and transports those pollutants in surface runoff or leaches those pollutants into the soil and groundwater, it becomes a waste. “Low threat” discharges to land are not expected to contain significant concentrations of pollutants that can adversely affect the quality of underlying groundwater.

The following types of discharge not regulated or authorized under WDRs may be eligible for Conditional Waiver No. 2:

- Discharges from the construction and test pumping of water wells to land
- Discharges of air conditioner condensate or non-contact cooling water to land
- Swimming pool discharges to land
- Discharges from short-term construction dewatering operations to land
- “Low Threat” discharges to land and/or groundwater, which may including the following:
  - Groundwater pumped from drinking water wells
  - Groundwater from foundation drains, crawl space pumps, and footing drains
  - Discharges from flushing water lines
  - Discharges from washing vehicles, pavement, buildings, etc.
  - Infiltration from residential/commercial/industrial/recreational facility landscape and lawn irrigation using groundwater or municipal supply water
  - Infiltration from structural infiltration-based best management practices (BMPs)

“Low threat” discharges are not expected to adversely affect the quality of groundwater. These types of discharge have similar properties, threat to water quality, and waiver conditions. Therefore, these types of “low threat” discharges to land were grouped together into one discharge classification. Discharges that comply with the waiver conditions are not expected to pose a threat to the quality of waters of the state.

Low volumes and infrequent “low threat” discharges are not expected to adversely affect the quality of groundwater because the water would likely evapotranspire before infiltrating to the underlying groundwater. However, excessive volumes or frequent “low threat” discharges could potentially infiltrate to underlying groundwater and adversely affect the quality of groundwater over time. With proper management, “low threat” discharges to land are not expected to pose a threat to the quality of waters of the state. Therefore, waiver conditions must require proper management of “low threat” discharges to land to minimize or eliminate the discharge of pollutants to waters of the state.

Waiver conditions should be developed in order for members of the public, cities, counties, local agencies and organizations, and/or the San Diego Water Board to determine if any “low threat” discharges to land pose a threat to the quality of the waters of the state. If owners/operators with “low threat” discharges are not in compliance with waiver conditions, they can be issued a Notice of Violation and required to correct deficiencies in order to be eligible for Conditional Waiver No. 2. However, if the owner/operator of a “low threat” discharge violates any waiver conditions, the San Diego Water Board has the option to terminate the conditional waiver for the discharge and begin regulating with individual WDRs and/or take other enforcement actions.

In order to be eligible for Conditional Waiver No. 2, discharges must comply with certain conditions to be protective of water quality. The waiver conditions applicable to “low threat” discharges to land include the following:

- 2.I.A. General Waiver Conditions for “Low Threat” Discharges of Water to Land
- 2.II.A. Specific Waiver Conditions for Air Conditioner Condensate and Non-contact Cooling Water Discharges to Land
- 2.II.B. Specific Waiver Conditions for Swimming Pool Discharges to Land
- 2.II.C. Specific Waiver Conditions for Pumping of Groundwater from Wells to Land
- 2.II.D. Specific Waiver Conditions for Dewatering Operations Discharged to Land
- 2.II.E. Specific Waiver Conditions for Discharges from Washing Vehicles, Pavement, Buildings, etc. to Land
- 2.II.F. Specific Waiver Conditions for Discharges from Irrigated Lawns and Landscaping Using Groundwater or Municipal Supply Water
- 2.II.G. Specific Waiver Conditions for Discharges from Structural BMPs that Require Infiltration

“Low threat” discharges to land that comply with the general and specific waiver conditions in Conditional Waiver No. 2 are not expected to pose a threat to the quality of waters of the state.

**2.I.A. General Waiver Conditions for “Low Threat” Discharges of Water to Land**

1. Prevent the direct or indirect discharge of “low threat” discharges to any surface waters of the state (including ephemeral streams and vernal pools).
2. “Low threat” discharges must not cause the migration of contaminants such as chlorinated solvents, hydrocarbons, or other toxic or hazardous substances to groundwater.
3. “Low threat” discharges must not come in contact with any material that consists of or is contaminated with chlorinated solvents, hydrocarbons, or other toxic or hazardous substances prior to discharge to land.
4. Any products used to condition or treat “low threat” discharges prior to discharging to land must be in accordance with manufacturer’s instructions and guidelines, and must reliably attenuate before infiltrating to underlying groundwater.

5. "Low threat" discharges to land must not adversely affect the quality or beneficial uses of underlying groundwater.
6. "Low threat" discharges to land must not cause or threaten to cause a condition of contamination, pollution, or nuisance.
7. "Low threat" discharges to land must not adversely impact the quality or beneficial uses of groundwater in any water wells.
8. The San Diego Water Board and/or other local regulatory agencies must be allowed reasonable access to the site in order to perform inspections and conduct monitoring.
9. Discharger must submit a Notice of Intent or technical and/or monitoring program reports when directed by the San Diego Water Board.

***2.II.A. Specific Waiver Conditions for Air Conditioner Condensate and Non-contact Cooling Water Discharges to Land***

1. Discharges must not contain contact cooling water.
2. Discharges of air conditioner condensate and non-contact cooling water to land must not exceed an average of 1,200 gallons per day for any continuous 365-day period, unless the discharger has filed a Notice of Intent containing information about the operator, location, and planned period of and average daily volume of discharge.

***2.II.B. Specific Waiver Conditions for Swimming Pool Discharges to Land***

1. Discharges of water from each swimming pool to land must not exceed 50,000 gallons during any continuous 365-day period, unless the discharger has filed a Notice of Intent containing information about the swimming pool location and volume, planned period of and frequency of discharge.

***2.II.C. Specific Waiver Conditions for Pumping of Groundwater from Wells to Land***

1. The discharge of groundwater pumped from any well that is used in a soil and/or groundwater contamination investigation or corrective action may not be discharged to land, unless the discharger has filed a Notice of Intent containing monitoring data demonstrating that the quality of the proposed discharge would not cause the groundwater at the disposal site to exceed water quality objectives.
2. For multiple applications of groundwater from wells pumped to land over a 365-day period, or a continuous 24-hour (or longer) application of groundwater from wells pumped to land within a 365-day period, the discharger must file a Notice of Intent containing information about the operator, location, planned period of and frequency of discharge, and measures that will be taken to minimize or eliminate the discharge of pollutants that might affect surface water and groundwater quality. Sufficient information demonstrating compliance with waiver conditions must be submitted before the discharge may begin.
3. Groundwater cannot originate from an area that contains any contaminated soil or groundwater.

**2.II.D. Specific Waiver Conditions for Dewatering Operations Discharged to Land**

1. The discharge of groundwater pumped from any well or excavation that is used in a soil and/or groundwater contamination investigation or corrective action may not be discharged to land, unless the discharger has filed a Notice of Intent containing monitoring data demonstrating that the quality of the proposed discharge would not cause the groundwater at the disposal site to exceed water quality objectives..
2. For dewatering operations that discharge an average of 5,000 gallons per day for any continuous 180-day period, the discharger must file a Notice of Intent containing information about the operator, location, planned period and rate of discharge, and measures that will be taken to minimize or eliminate the discharge of pollutants that might affect groundwater quality. Sufficient information demonstrating compliance with waiver conditions must be submitted before the discharge may begin.
3. Groundwater cannot originate from an area that contains any contaminated soil or groundwater.

**2.II.E. Specific Waiver Conditions for Discharges from Washing Vehicles, Pavement, Buildings, etc. to Land**

1. Discharges of wash water and similar intermittent discharges must not exceed an average of 1,200 gallons per day for any continuous 30-day period, unless the discharger has filed a Notice of Intent containing information about the operator, location, and planned period of and average daily volume of discharge.

**2.II.F. Specific Waiver Conditions for Discharges from Irrigated Lawns and Landscaping Using Groundwater or Municipal Supply Water**

1. Products applied to lawns and landscaping must be in accordance with manufacturer's instructions and guidelines, and must reliably attenuate before infiltrating to underlying groundwater.

**2.II.G. Specific Waiver Conditions for Discharges from Structural BMPs that Require Infiltration.**

1. Installation of structural BMP that utilizes infiltration must comply with the design criteria of the municipality regulated by MS4 WDRs (NPDES storm water permit), **or**, for any discharge that exceeds an average of 1,200 gallons per day for any continuous 365-day period, the discharger must file a Notice of Intent containing documentation demonstrating that the quality of the proposed discharge from infiltration will not cause the groundwater at the disposal site to exceed water quality objectives.
2. Installation of structural BMPs that require infiltration must comply with local, state, and federal ordinances and regulations and obtain any required approvals, permits, certifications, and/or licenses from authorized local agencies.

## D.10 Statewide Permits, WDRs or Waivers

WQO-2003-0003-DWQ. General Waste Discharge Requirements for Discharges to Land with a Low Threat to Water Quality

Order No. 2006-0008-DWQ NPDES CAG990002 General National Pollutant Discharge Elimination System (NPDES) Permit for Discharges from Utility Vaults and Underground Structures to Surface Waters

This Page Intentionally Left Blank.

**STATE WATER RESOURCES CONTROL BOARD  
WATER QUALITY ORDER NO. 2003 – 0003 - DWQ**

**STATEWIDE GENERAL WASTE DISCHARGE  
REQUIREMENTS (WDRs) FOR DISCHARGES TO LAND WITH  
A LOW THREAT TO WATER QUALITY (GENERAL WDRs)**

The State Water Resources Control Board (SWRCB) finds that:

1. Section 13260(a) of the California Water Code (CWC) requires that any person discharging waste or proposing to discharge waste within any region, other than to a community sewer system, which could affect the quality of the waters of the State<sup>1</sup>, file a report of waste discharge (ROWD).
2. The discharges to land with a low threat to water quality listed in Table 1 are low volume discharges with minimal pollutant concentrations and are disposed of by similar means. These discharges are appropriately regulated under General WDRs.

**Table 1. Categories of Low Threat Discharges**

| <b>CATEGORY</b>  |
|--|
| <b>Wells/Boring Waste</b>  |
| Well Development Discharge   |
| Monitoring Well Purge Water Discharge  |
| Boring Waste Discharge   |
| <b>Clear Water Discharges</b>  |
| Water Main/ Water Storage Tank/ Water Hydrant Flushing                         |
| Pipelines/Tank Hydrostatic Testing Discharge                                   |
| Commercial and Public Swimming Pools   |
| <b>Small Dewatering Projects</b>   |
| Small /Temporary Dewatering Projects (such as excavations during construction) |
| <b>Miscellaneous</b>   |
| Small Inert Solid Waste Disposal Operations                                    |
| Cooling Discharge  |

See Attachment 1 to these General WDRs for discharge category definitions.

3. All WDRs must implement the Regional Water Quality Control Board (Regional Board) Water Quality Control Plan (Basin Plan) for the Region affected by the discharge. These General WDRs require Dischargers to comply with all applicable Basin Plan provisions, including any prohibitions and water quality objectives governing the discharge.

---

<sup>1</sup> “Waters of the State” as defined in CWC Section 13050(e)

4. These General WDRs establish minimum standards for the discharges listed in Table 1. The Discharger must comply with any more stringent standards in the applicable Basin Plan. In the event of a conflict between the provisions of these General WDRs and the applicable Basin Plan, the more stringent provision prevails.
5. The beneficial uses for the groundwaters of the State include, but are not limited to: municipal supply (MUN), industrial service supply (IND), industrial process supply (PROC), fresh water replenishment (FRESH), groundwater recharge (GWR), and agricultural supply (AGR).
6. The discharges listed in Table 1 have the lowest Threat to Water Quality (TTWQ) and Complexity, as defined in Section 2200, Title 23 of the California Code of Regulations (CCR). Discharges with the lowest TTWQ are those discharges of waste that could degrade water quality without violating water quality objectives or cause a minor impairment of designated beneficial uses. Low threat discharges that do not require any chemical, biological, or physical treatment have the lowest Complexity rating.
7. Dischargers seeking coverage under these General WDRs must file with the appropriate Regional Board: (a) a Notice of Intent (NOI) to comply with the terms and conditions of these General WDRs or a ROWD<sup>2</sup>, (b) the applicable first annual fee as required by Title 23, CCR, Section 2200, (c) a project map, (d) evidence of California Environmental Quality Act (CEQA) compliance, and (e) a discharger monitoring plan. Upon review by Regional Board staff, a determination will be made as to whether or not coverage under these General WDRs is appropriate. The Discharger will be notified by a letter from the Regional Board Executive Officer<sup>3</sup> when coverage under these General WDRs has begun.
8. Dischargers with low threat discharges listed in Table 1 currently covered by waivers or individual WDRs need not apply for coverage under these General WDRs unless requested to do so by the Regional Board.
9. Although a discharge may be eligible for coverage under these General WDRs, the Regional Board may elect to regulate the discharge under other WDRs or a conditional waiver. If the Regional Board has established WDRs or a conditional waiver, these General WDRs are not applicable.
10. The following discharge categories from Table 1 are exempt from SWRCB promulgated Title 27 requirements: Wells/Boring Waste Discharges, Clear Water Discharges, Small Dewatering Projects, and Cooling Discharges (Section 20090).

---

<sup>2</sup> If a ROWD is submitted instead of an NOI, the discharger must complete Sections VII-XV and XVII of the NOI (Attachment 3) and submit them to the Regional Board.

<sup>3</sup> Regional Board Executive Officer or designee.

11. Title 27, Section 20230 of CCR exempts dischargers of inert solid wastes from the requirement to discharge at classified solid waste sites. Section 20230 also gives Regional Boards the option to assign individual or general WDRs for inert solid waste discharges.
12. Discharges to lands that have been listed as hazardous materials sites, pursuant to Government Code Section 65962.5, are not eligible for coverage under these General WDRs. Discharges that will significantly physically divide an established community, significantly conflict with any applicable land use plan/policy/regulation of an agency with jurisdiction over the project, or significantly conflict with any applicable habitat/community conservation plan are not eligible for coverage under these General WDRs.
13. Discharges that could have a significant impact on Biological Resources<sup>4</sup>, Cultural Resources<sup>5</sup>, Aesthetics<sup>6</sup>, Air Quality<sup>7</sup> or that could significantly alter the existing drainage pattern of the discharge site or surrounding area are not eligible for coverage under these General WDRs.
14. Small inert waste disposal operations and small temporary dewatering operations located on unstable geologic units/soils or expansive soils are not eligible for coverage under these General WDRs. Small inert waste disposal operations and small temporary dewatering operations that could significantly conflict with existing zoning for agriculture use or a Williamson Act contract are not eligible for coverage under these General WDRs.
15. Small inert waste disposal operations that are within the boundaries of a comprehensive airport land use plan or, if a comprehensive airport land use plan has not been adopted, within two nautical miles of a public airport or public use airport are not eligible for coverage under these General WDRs.
16. A Negative Declaration in compliance with CEQA has been adopted for these General WDRs. The environmental impacts from new discharges authorized by these General WDRs have been found to be less than significant.
17. Potential Dischargers and all other known interested parties have been notified of the intent to prescribe WDRs as described in these General WDRs.
18. All comments pertaining to the proposed discharges have been heard and considered in a public meeting.

IT IS HEREBY ORDERED, that the Discharger, in order to meet the provisions contained in Division 7 of CWC and regulations adopted thereunder, shall comply with the following:

---

<sup>4</sup> As defined by the CEQA, Environmental Checklist Form, Title 14, California Code of Regulation, Appendix G, Section IV.

<sup>5</sup> As defined by the CEQA, Environmental Checklist Form, Title 14, California Code of Regulation, Appendix G, Section V.

<sup>6</sup> As defined by the CEQA, Environmental Checklist Form, Title 14, California Code of Regulation, Appendix G, Section I.

<sup>7</sup> As defined by the CEQA, Environmental Checklist Form, Title 14, California Code of Regulation, Appendix G, Section III

## **A. PROHIBITIONS:**

1. The discharge of any waste to surface waters is prohibited.
2. The disposal of wastes shall not cause pollution, contamination, or nuisance as defined in CWC Section 13050.
3. Discharge of wastes to lands not owned or controlled by the discharger is prohibited, unless the discharger has a written lease or an agreement with the owner.
4. The discharge of waste classified as “hazardous” or “designated” as defined in Title 22 CCR, Section 66261 and CWC Section 13173, is prohibited.
5. The discharge of waste shall not cause, wholly or in combination with any other discharge(s), the applicable Regional Board’s Basin Plan objectives for ground or surface waters to be exceeded.
6. The discharge of waste causing the spread of groundwater contamination is prohibited.
7. The discharge of water main, water storage tank, water hydrant pipeline flushing, or hydrostatic testing water from tanks or pipelines that have been used to store or convey any medium other than potable water is prohibited, unless the Discharger has demonstrated to the Regional Board that all residual pollutant concentrations have been reduced to levels below Regional Board Basin Plan groundwater quality objectives.
8. The discharge of wastes at Small Inert Solid Waste Disposal Operations that are not listed in Attachment 2 to these General WDRs or approved by the Regional Board is prohibited.

## **B. DISCHARGE SPECIFICATIONS:**

Table 1 discharges, except monitoring well purge water and boring waste dischargers, shall not contain concentrations of pollutants in excess of the Basin Plan ground water quality objectives. Dischargers of boring waste shall not threaten an exceedance of applicable Basin Plan ground water quality objectives.

## **C. PROVISIONS:**

1. The following provisions apply to Small Inert Solid Waste Operations:
  - a. Inert solid waste facilities shall only accept inert solid wastes that are listed in Attachment 2 to these General WDRs or that are approved by the Regional Board.

- b. Access to the facility shall be limited to ensure that all types of inert solid wastes accepted at the site are in compliance with these General WDRs.
  - c. Inert solid waste facilities shall develop and implement a load checking program to ensure that all the types of waste accepted at the site are in compliance with these General WDRs.
- 2. Discharges of boring waste, drilling mud, and cuttings from well-drilling operations shall be discharged to on-site sumps and shall not contain halogenated solvents. At the end of drilling operations, the Discharger shall either:
  - a. Remove all wastes from the sump; or
  - b. Remove all free liquid from the sump and cover residual solid and semi-solid wastes, provided that representative sampling of the sump contents after liquid removal shows residual solid wastes to be nonhazardous. Residual wastes shall be disposed at the proper Title 27, CCR classified waste disposal facility or onsite. Residual wastes discharged onsite shall meet the following requirements: (1) the discharge must be located greater than 5 feet above local groundwater level, (2) the discharge must be covered by a minimum of 1 foot of clean soil, and (3) the discharge must be located at least 100 feet from the nearest surface water. If the sump has appropriate containment features, it may be reused.
- 3. Monitoring well purge water shall be discharged at the monitoring well facility<sup>8</sup> and shall not degrade underlying groundwater. Monitoring well purge water shall not be discharged in a manner causing ponding or threatening a discharge to surface waters.
- 4. A minimum freeboard of two feet shall be maintained at all wastewater disposal ponds and wastewater storage ponds.
- 5. All storage and disposal facilities shall be protected against erosion, overland runoff, and other impacts resulting from storm events.
- 6. Dischargers applying for coverage under these General WDRs shall submit with their NOI a discharge monitoring plan (DMP). The DMP shall include the following information:
  - a. All pollutants believed to be present in the discharge
  - b. Approximate concentration of pollutants in the discharge
  - c. Monitoring locations
  - d. Monitoring frequencies

---

<sup>8</sup> A facility where monitoring well(s) have been installed to monitor the migration or levels of a pollutant or the effects and/or migration of a particular discharge.

- e. Report schedule (dates that reports will be submitted to the Regional Board).

Material Safety Data Sheets (MSDS) and additional laboratory analysis may be required by the Regional Board to evaluate the discharge and approve the DMP.

The DMP will be subject to Regional Board Executive Officer<sup>9</sup> approval. The discharge may not be initiated until the Regional Board Executive Officer approves the DMP and sends notification of this approval by letter.

- 7. Dischargers of well development water, boring waste, and clear water discharges shall provide written notice to the Regional Board before initiating any discharge to a new site. Dischargers shall certify that the new discharge site is in compliance with these General WDRs and the requirements established by Sections VII-XVI of Attachment 3 (NOI). All other dischargers covered under these General WDRs are prohibited from discharging to sites not described in their NOI or ROWD.
- 8. Discharges of liquids derived from the purging, development, or sampling of groundwater from monitoring wells shall not contain nonaqueous phase liquids (i.e., concentrations of pollutants above the solubility limits).

#### **D. APPLICATION:**

- 1. Discharges described in the Findings are eligible for coverage under these General WDRs provided that the discharger submits to the appropriate Regional Board<sup>10</sup> the following:
  - a. An NOI to comply with these General WDRs (Attachment 3 to these General WDRs) or an ROWD<sup>11</sup>.
  - b. A project map.
  - c. Evidence of compliance with CEQA, if any other public agency has required the project to comply with CEQA.
  - d. A first annual fee as described in Finding No. 6.
  - e. A DMP, as described in Provision C.6.
  - f. Any other additional information requested by the Regional Board to evaluate the discharge.

---

<sup>9</sup> Regional Board Executive Officer or designee.

<sup>10</sup> Appropriate Regional Board is the Regional Board that regulates discharges of pollutants to waters of the State for the area that the proposed discharge will occur.

<sup>11</sup> If an ROWD is submitted instead of an NOI, the discharger must complete Sections VII-XV and XVII of the NOI (Attachment 3) and submit them to the Regional Board.

#### **E. STANDARD PROVISIONS:**

1. A copy of these General WDRs shall be kept at the discharge facility for reference by operating personnel. Key operating and site management personnel shall be familiar with its contents.
2. The Discharger shall develop a discharge management plan incorporating contingency measures, should sampling results show violation of water quality standards. In no case shall the discharge continue to impair beneficial uses or violate water quality standards or cause a possible nuisance condition.
3. The Discharger shall take all reasonable steps to prevent any discharge in violation of these General WDRs.
4. The Discharger shall properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) at all times to assure compliance with these General WDRs. Proper operation and maintenance also include adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems when necessary to assure compliance with the conditions of these General WDRs.
5. Prior to any modifications in the Discharger's facility, that would result in a material change in the quality or quantity of waste discharged or any material change in the location of the discharge, the Discharger shall report in writing to the appropriate Regional Board all pertinent information and obtain confirmation from the Regional Board that such modifications do not disqualify the Discharger from coverage under these General WDRs. Confirmation or new WDRs shall be obtained before any modifications are implemented.
6. In the event of any change in control or ownership of land or waste discharge facilities presently owned or controlled by the discharger, the discharger shall notify the succeeding owner or operator of the existence of these General WDRs by letter, a copy of which shall be immediately forwarded to the appropriate Regional Board office. The discharger shall also submit a Notice of Termination (Attachment No. 4 to these General WDRs) to the appropriate Regional Board.
7. These General WDRs do not convey any property rights or exclusive privileges. The requirements prescribed herein do not authorize the commission of any act causing injury to persons or property, do not protect the Discharger from liability under federal, State, or local laws, and do not create a vested right to continue to discharge wastes.
8. These General WDRs do not relieve the Discharger from the responsibility to obtain other necessary local, State, and federal permits to construct facilities necessary for compliance with these General WDRs, nor do these General WDRs prevent imposition of additional standards, requirements, or conditions by any other regulatory agency.

9. The Discharger shall allow the Regional Board or an authorized representative, upon the presentation of credentials and other documents as may be required by law, to do the following:
  - a. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted or where records must be kept under the conditions of these General WDRs,
  - b. Access and copy, at reasonable times, any records that must be kept under the conditions of these General WDRs;
  - c. Inspect at reasonable times any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under these General WDRs; and
  - d. Sample or monitor, at reasonable times, for the purposes of assuring compliance with these General WDRs or as otherwise authorized by the CWC any substances or parameters at any location.
10. After notice and opportunity for a hearing, coverage of an individual discharge under these General WDRs may be terminated or modified for cause, including but not limited to, the following:
  - a. Violation of any term or condition of these General WDRs;
  - b. In obtaining these General WDRs, misrepresentation or failure to disclose all relevant facts; and
  - c. A change in any condition that requires either a temporary or permanent reduction or elimination of the authorized discharge.
11. The filing of a request by the Discharger for an Order to modify, revoke and reissue, or terminate the filing of or a notice of planned changes or anticipated noncompliance does not stay any condition of these General WDRs.
12. The Discharger shall comply with Monitoring and Reporting Program for Water Quality Order No. 2003-0003-DWQ, the approved DMP, and any revisions as prescribed thereto by the Regional Board Executive Officer.
13. Where the Discharger becomes aware that it failed to submit any relevant facts in a ROWD/NOI or submitted incorrect information in an ROWD/NOI or in any report to the Regional Board, it shall promptly submit the required facts or information.
14. The Discharger shall furnish, within a reasonable time, any information the Regional Board or SWRCB may request to determine whether cause exists for modifying, revoking and reissuing, or terminating the Discharger's coverage under these General WDRs. The Discharger shall also furnish to the Regional Board or SWRCB, upon request, copies of records required to be kept by these General WDRs.

15. The CWC provides that any person failing or refusing to furnish technical or monitoring program reports, as required under these General WDRs, or falsifying any information provided in the monitoring reports is subject to civil liability for each day of violation.
16. The Discharger shall take all necessary steps to minimize or correct any adverse impact on the environment resulting from noncompliance with these General WDRs, including such accelerated or additional monitoring as may be necessary to determine the nature and impact of the noncompliance.
17. All reports, NOI, other documents required by these General WDRs, and other information requested by the Regional Board shall be signed by a person described below or by a duly authorized representative of that person.
  - a. For a corporation: by a responsible corporate officer such as (1) a president, secretary, treasurer, or vice president of the corporation in charge of a principal business function; (2) any other person who performs similar policy or decision-making functions for the corporation; or (3) the manager of one or more manufacturing, production, or operating facilities if authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures.
  - b. For a partnership or sole proprietorship: by a general partner or the proprietor.
  - c. For a municipality, State, federal, or other public agency: by either a principal executive officer or ranking elected official.
18. Any person signing a document under Provision E.17 makes the following certification, whether written or implied:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gathered and evaluated the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations."
19. The Discharger shall immediately report any noncompliance potentially endangering public health or the environment. Any information shall be provided orally to the Regional Board within 24 hours of the time the Discharger becomes aware of the occurrence. A written report shall also be submitted to the Regional Board Executive Officer within five (5) calendar days of the time the Discharger becomes aware of the occurrence. The written report shall contain (a) a description of the noncompliance and its cause; (b) the period of the noncompliance event, including dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and (c) steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance.

20. The Discharger shall report all instances of noncompliance not reported under Provision No. E.19 at the time monitoring reports are submitted. The reports shall contain any applicable information listed in Provision No. E.19.
21. The Discharger shall give notice to the Regional Board as soon as possible of any planned alterations to the permitted facility that may change the nature or concentration of pollutants in the discharge.
22. The Discharger shall comply with all of the conditions of these General WDRs. Any noncompliance with these General WDRs constitutes a violation of the CWC and is grounds for an enforcement action.

#### CERTIFICATION

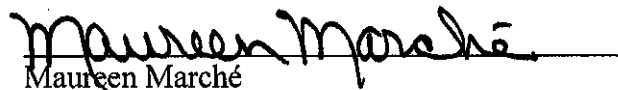

The undersigned, Clerk to the Board, does hereby certify that the foregoing is a full, true, and correct copy of an order duly and regularly adopted at a meeting of the State Water Resources Control Board held on April 30, 2003.

AYE: Arthur G. Baggett, Jr.

**DISCHARGE CATEGORY DEFINITIONS**

1. Well Development Discharge is any discharge of water to land during the development of a water well.
2. Monitoring Well Purge Water Discharge is any discharge of well water to land in the immediate vicinity of the monitoring well site during monitoring well sampling.
3. Boring Waste Discharge is any discharge of drilling mud and cuttings from well-drilling operations or any other borings in uncontaminated soils.
4. Water main, storage tank, and hydrant flushing discharges are discharges of potable or untreated clear water to land from water line and tank flushing operations.
5. Pipeline and Tank Hydrostatic Testing Discharges are discharges of potable or untreated clear water to land from hydrostatic testing of pipelines and tanks.
6. Commercial and Public Swimming Pool Discharges are discharges of swimming pool water to land.
7. Small Temporary Dewatering Projects are projects that discharge groundwater to land from small construction projects, excavation projects, or dewatering of underground utility vaults.
8. Small Inert Solid Waste Disposal Operations are operations or facilities, covering two acres of land or less, that accept wastes, which do not contain hazardous waste or soluble pollutants at concentrations in excess of applicable water quality objectives and do not contain significant quantities of decomposable waste.
9. Cooling Discharge is non-contact cooling water discharge, air conditioner condensate discharge, discharge from evaporators, and discharge from heat exchangers.

**INERT SOLID WASTES LIST**

1. Inert mining wastes, including native geological materials generated during aggregate mining activities at or in the vicinity of the site
2. Uncontaminated soil, inert rock, and gravel
3. Broken concrete
4. Bricks
5. Glass and ceramics not containing lead
6. Inert plastics
7. Broken asphalt paving fragments (asphalt shall not be discharged to standing water nor shall it be placed below the highest anticipated groundwater elevation)

| Description of Operations:  |  |
| Approximate Volume of Discharge (for liquid discharges), or Flowrate:<br><input type="checkbox"/> Intermittent Discharge<br><input type="checkbox"/> Continuous Discharge | Gal/day, gal                               |
| Pollutants/Constituents Present in the Discharge and their Approximate Concentration*:  | Mg/L                                       |
| Land Use Zone:  |  |
| Adjacent Land Use Zones:  |  |

Attach additional pages to characterize the discharge if necessary.

- VII. Does the proposed discharge have the potential to adversely impact a scenic vista, substantially damage scenic resources within a state scenic highway, or substantially degrade the existing visual character/quality of the discharge site/surroundings?  
☐ YES      ☐ NO
- VIII. Would the proposed discharge conflict with existing zoning for agricultural use or a Williamson Act contract?  
☐ YES      ☐ NO
- IX. Does the proposed discharge have the potential to significantly impact an applicable air quality plan, significantly violate any air quality standard or contribute to an existing violation, result in a cumulatively considerable net increase of any criteria pollutant for which the project region is non-attainment under an applicable federal or state ambient air quality standard, or significantly expose sensitive receptors to substantial pollutant concentrations?  
☐ YES      ☐ NO
- X. Do any locations within the proposed discharge site contain biologically unique or sensitive natural communities?  
☐ YES      ☐ NO
- XI. Does the discharge have the potential to cause a substantial adverse change in the significance of a historical or archeological resource (CCR Section 15064.5), directly or indirectly destroy a unique paleontological resource or site or unique geologic feature, or disturb any human remains?  
☐ YES      ☐ NO
- XII. Is the proposed discharge site located on unstable geologic units/soils or expansive soils?  
☐ YES      ☐ NO
- XIII. Is the proposed discharge site located on a hazardous materials site, as defined by Government Code Section 65962.5?  
☐ YES      ☐ NO
- XIV. Does the proposed discharge have the potential to substantially alter the existing drainage pattern of the discharge site?  
☐ YES      ☐ NO
- XV. Does the proposed discharge have the potential to significantly physically divide an established community, significantly conflict with any applicable land use plan/policy/regulation of an agency with jurisdiction over the project, or conflict with any applicable habitat/community conservation plan?  
☐ YES      ☐ NO
- XVI. California Environmental Quality Act (CEQA) (If any other public agency has required the project to comply with CEQA, dischargers must submit evidence of CEQA compliance to be eligible for coverage under these General WDRs).
- a. Name of Lead Agency: \_\_\_\_\_
- b. Has a public agency determined that the proposed project is exempt from CEQA?  
☐ YES      ☐ NO
- Basis for Exemption/Agency: \_\_\_\_\_
- c. Has a "Notice of Determination" been filed under CEQA?  
☐ YES      ☐ NO

If yes, enclose a copy of the CEQA document, Environmental Impact Report (EIR), or Negative Declaration. If no, identify the expected type of CEQA document and expected date of completion.

d. EIR Negative Declaration expected CEQA completion date: \_\_\_\_\_

e. Expected CEQA documents: \_\_\_\_\_

Please submit the following with the Notice of Intent to the appropriate Regional Water Quality Control Board:

- a. Project map
- b. Evidence of compliance with the CEQA, if any other public agency has required the project to comply with CEQA
- c. First annual fee as described in Finding No. 6
- d. A DMP, as described in Provision C.6

**STATE WATER RESOURCES CONTROL BOARD**  
**MONITORING AND REPORTING PROGRAM FOR**  
**WATER QUALITY ORDER NO. 2003-0003-DWQ**  
**STATEWIDE GENERAL WASTE DISCHARGE REQUIREMENTS FOR**  
**DISCHARGES TO LAND WITH A LOW THREAT TO WATER QUALITY**

**A. MONITORING PROVISIONS:**

1. Unless otherwise approved by the appropriate Regional Water Quality Control Board (Regional Board) Executive Officer, all analyses shall be conducted at a laboratory certified for such analyses by the California Department of Health Services. All analyses shall be conducted in accordance with the latest edition of "Guidelines Establishing Test Procedures for Analysis of Pollutants," promulgated by the U.S. Environmental Protection Agency (USEPA).
2. If the Discharger monitors any constituent more frequently than required by the General WDRs, the monitoring results shall be submitted.
3. The Discharger shall retain records of all monitoring information including all calibration and maintenance records, copies of all reports required by these General WDRs, and records of all data used to complete the application for these General WDRs. Records shall be maintained for a minimum of three years from the date of the sample, measurement, or report. This period may be extended during the course of any unresolved litigation regarding this discharge or when requested by the appropriate Regional Board Executive Officer.
4. Records of monitoring information shall include the following:
  - a. The date, exact place, and time of sampling or measurements,
  - b. The individual(s) who performed the sampling or measurements,
  - c. The date(s) analyses were performed,
  - d. The individual(s) who performed the analyses,
  - e. The analytical techniques or method used, and
  - f. The results of such analyses.
5. All monitoring instruments and devices that are used by the Discharger to fulfill the prescribed monitoring program shall be properly maintained and calibrated as necessary to ensure their continued accuracy.

**B. DISCHARGE MONITORING:**

1. Wells/boring waste and clear water dischargers shall submit the following information before initiation of discharge at a new site: (a) discharge site address and (b) discharge site latitude and longitude (if known).
2. Monitoring requirements for each discharge category are listed in Table 2. This monitoring program may be modified by the Regional Board Executive Officer.

**Table 2. Monitoring Requirements Specific for each Discharge Category**

| CATEGORY   | CONSTITUENTS   | FREQUENCY   |
|--|--|---|
| <b>Wells/Boring Waste</b>  |  |   |
| Water Well Development Discharge   |  |   |
| Monitoring Well Purge Water Discharge  | Constituents that the monitoring well is used to monitor                       | Consistent with the frequency of groundwater monitoring |
| Boring Waste Discharge   |  |   |
| <b>Clear Water Discharges</b>  |  |   |
| Water Main/Water Storage Tank/Water Hydrant Flushing                           | Approximate volume (gal) at each discharge location and date of each discharge | Semiannually  |
| Pipelines/Tank Hydrostatic Testing Discharge                                   | Approximate volume (gal) at each discharge location and date of each discharge | Semiannually  |
| Commercial and Public Swimming Pools   |  |   |
| <b>Small Dewatering Projects</b>   |  |   |
| Small /Temporary Dewatering Projects (such as excavations during construction) |  |   |
| <b>Miscellaneous</b>   |  |   |
| Small Inert Solid Waste Disposal Operations                                    | Approximate yd. <sup>3</sup> /day accepted by the site                         | Semiannually  |
| Evaporative Cooling Water  |  |   |

**C. REPORT SCHEDULE:**

Monitoring reports shall be submitted to the Regional Board Executive Officer in accordance with the following schedule:

| <u>Reporting Frequency</u> | <u>Report Period</u>  | <u>Report Due</u>                                 |
|----------------------------|---|---|
| Quarterly                  | January-March<br>April-June<br>July-September<br>October-December | May 15<br>August 15<br>November 15<br>February 15 |
| Semiannually               | January-June<br>July-December                                     | August 15<br>February 15                          |

Linda S. Adams  
Secretary for  
Environmental Protection

### GENERAL NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT FOR DISCHARGES FROM UTILITY VAULTS AND UNDERGROUND STRUCTURES TO SURFACE WATERS

---

**ORDER NO. 2006-0008-DWQ**  
**NPDES NO. CAG990002**

A Discharger, as described in the following table, that has complied with the requirements for coverage under this Order is authorized to discharge under this Order, once permit coverage is effective, as described in this Order.

|                    |   |
|--------------------|---|
| <b>Dischargers</b> | <b>Utility companies with short-term intermittent discharges from utility vaults and underground structures to waters of the United States that do not cause, have the reasonable potential to cause, or contribute to an instream excursion above any applicable State or federal water quality objectives/criteria or cause acute or chronic toxicity in the receiving water.</b> |
|--------------------|---|

|  |                        |
|--|------------------------|
| This Order was adopted by the State Water Board on:  | <b>July 19, 2006</b>   |
| This Order shall become effective on:  | <b>January 1, 2007</b> |
| This Order shall expire on:  | <b>July 19, 2011</b>   |
| The U.S. Environmental Protection Agency (USEPA) and the State Water Board have classified this discharge as a <b>minor</b> discharge. |                        |

IT IS HEREBY ORDERED that Order No. **2001-0011-DWQ** is rescinded upon the effective date of this Order except for enforcement purposes, and, in order to meet the provisions contained in Division 7 of the California Water Code (CWC) and regulations adopted thereunder, and the provisions of the federal Clean Water Act (CWA), and regulations and guidelines adopted thereunder, Dischargers shall comply with the requirements in this Order.

I, Song Her, Clerk to the Board, do hereby certify the following is a full, true, and correct copy of an Order adopted by the State Water Resources Control Board on July 19, 2006.

## I. DISCHARGE INFORMATION

Utility companies supply resources, excluding water, necessary for day-to-day living and/or operations. This includes, but is not limited to, suppliers of natural gas, electricity, and telephone services. Utility companies with short-term intermittent discharges from utility vaults and underground structures to waters of the United States that do not cause, have the reasonable potential to cause, or contribute to an in-stream excursion above any applicable State or federal water quality objectives/criteria or cause acute or chronic toxicity in the receiving water are authorized to discharge in accordance with the conditions set forth in this Order.

Due to the large number of vaults under each utility company, there is no single "facility." To avoid confusion, the term "site" will be used when referring to a vault or underground structure and the term "discharger" will be used when referring to the utility company.

## II. NOTIFICATION REQUIREMENTS

A. **General Permit Application.** To obtain coverage under this National Pollutant Discharge Elimination System (NPDES) General Permit, a Notice of Intent (NOI), a project map(s), a Pollution Prevention Plan (PLAN), and the first annual fee must be submitted to the State Water Resources Control Board (State Water Board). A Discharger must submit a separate enrollment for discharges located within each Regional Water Quality Control Board (Regional Water Board) boundary as defined in section 13200 of the California Water Code (CWC). Each enrollment will cover all discharges occurring within the boundaries of that Regional Water Board. However, only one annual fee is required for each Discharger.

The NOI must include the name, address, and telephone number of the owner or operator. The NOI must also include the name and address of the utility, the type of utility or discharges, and the receiving waterbody(s). In addition, the NOI must include a project map(s) that shows the essential features of the distribution system within the Regional Water Board boundary and maps of the corresponding surface water or storm drain to which water may be discharged for five representative sites. The NOI form may be found within this General Permit package as Attachment B. Attachment C contains guidance on completing the NOI. The PLAN must contain the information detailed in VII.C.3.e of this Order.

The General Permit Application, including the NOI, map(s), PLAN, and fee, must be submitted to the following address:

Utility Vaults NOI - NPDES Unit  
Division of Water Quality  
State Water Resources Control Board  
P.O. Box 100  
Sacramento, CA 95812-0100

A copy of the PLAN must also be sent to the appropriate Regional Water Board(s). See the Regional Water Boards' map on page C-4 in Appendix C.

- B. **General Permit Coverage.** Permit coverage will be effective when all of the following have occurred: (1) The Discharger has submitted a complete permit application; (2) Receipt of a complete application is noticed for a minimum of 30 days and copies provided to the public for review and comment upon request; (3) The proposed PLAN has been reviewed by Regional Water Board staff; and (4) The PLAN has been approved by the Regional Water Board Executive Officer, or by the Regional Water Board after a public hearing, if requested.
- C. **Exclusion of Coverage.** The authorization to discharge under this General Permit is terminated upon receipt of a Notice of Exclusion (NOE) or if the appropriate Regional Water Board decides that the discharge would best be regulated under either an individual or another general permit. An NOE is a one-page notice that states that the Discharger is not eligible for coverage under this General Permit and provided the reason for the exclusion.
- D. **Eligibility Criteria.** To be authorized by this General Permit, Dischargers must meet the following criteria:
1. Pollutant concentrations in the discharge do not cause, have a reasonable potential to cause, or contribute to an excursion above any applicable federal water quality criterion established by the U.S. Environmental Protection Agency (USEPA) pursuant to Clean Water Act (CWA) section 303. Pollutant concentrations in the discharge do not cause, have a reasonable potential to cause, or contribute to an excursion above any water quality objective adopted by the appropriate Regional or State Water Board, including prohibitions of discharge for the receiving waters.
  2. The discharge does not cause acute or chronic toxicity in the receiving water.
- E. **Discharge to a Municipal Separate Storm Sewer System.** Whenever there is a discharge of 50,000 gallons or more to a municipal separate storm sewer system (MS4), the Discharger shall contact the appropriate local agency with jurisdiction over the MS4 within 24 hours. It is the State Water Board's intention with this requirement to encourage communication between Dischargers under this General Permit and local agencies responsible for MS4s to reduce misunderstandings and concerns over the types of discharges covered by this General Permit.
- F. **Termination of Discharges.** Dischargers shall submit a Notice of Termination or Transfer (NOTT) when coverage under this General Permit is no longer needed. An NOTT is a form that lists the Waste Discharge Identification Number (WDID), the name and address of the owner of the utility, and is signed and dated by the owner certifying that the Dischargers associated with Permit No. CAG990002 have been eliminated or that there has been a change in ownership. Upon submission, the Discharger is no longer authorized to discharge wastewater associated with this General Permit.

**G. Changes from Authorization Under General Permit to Individual Permit.**

Dischargers already covered under the NPDES program, whether by general or individual permit, may elect to continue coverage under the existing permit or may submit a complete application for coverage under this General Permit. Dischargers who submit a complete application under this General Permit are not required to submit an individual permit application. The Regional Water Board may request additional information and determine that a Discharger is not eligible for coverage under this General Permit and would be better regulated under an individual or other general NPDES permit or, for discharges to land, under waste discharge requirements (WDRs). If a Regional Water Board issues an NPDES permit or WDRs, the applicability of this General Permit to the specified discharge is immediately terminated on the effective date of the NPDES permit or WDRs.

**H. Transferring Ownership.** In the event of any change in control or ownership of land or waste discharge facilities presently owned or controlled by the Discharger, the Discharger must notify the succeeding owner or operator of the existence of this General Permit by letter, a copy of which must be immediately forwarded to the Regional Water Board office. The Discharger must submit an NOTT to the Regional Water Board and a copy of the NOTT to the State Water Board. The succeeding owner or operator must then submit a new general permit application.

### **III. FINDINGS**

The State Water Board finds:

**A. Background.** This Order replaces Order No. 2001-0011-DWQ. The NPDES No. CAG990002 remains the same. Utility companies with utility vaults and underground structures enrolled under previous Order No. 2001-0011-DWQ must obtain coverage under this new Order to continue their authorization to discharge. To obtain authorization for continued and future discharge to waters of the United States, Dischargers must submit a complete application, as described in II. A. above, and obtain coverage in order to be regulated under this General Permit as provided in 40 Code of Federal Regulations (CFR) section 122.28 (b)(2).

**B. Discharge Description.** Utility companies operate and maintain numerous vaults and underground structures within their service territories. These vaults and structures may be located in residential, agricultural, commercial, or industrial areas. Sizes can vary from 15 cubic feet to 1,500 cubic feet, depending on their intended use, type, or contents. For safety reasons, utility companies must de-water vaults and underground structures prior to performing any repair, maintenance, and/or installation of equipment. When the amount of water in the vaults or structures interferes with the safety and quality of the work to be done, water must be pumped out. Volume of discharges can vary from a few gallons to a few thousand gallons depending on the configuration and individual situation at each vault or structure. These intermittent discharges are routed to waters of the United States directly or indirectly via local storm conveyance systems.

- C. **Legal Authorities.** This Order is issued pursuant to section 402 of the CWA and implementing regulations adopted by the USEPA and Chapter 5.5, Division 7 of the CWC. It shall serve as an NPDES permit for point source discharges from utility vaults and underground structures to surface waters. This Order also serves as WDRs pursuant to Article 4, Chapter 4 of the CWC.

States may request authority to issue general NPDES permits pursuant to 40 CFR section 122.28. On June 8, 1989, the State Water Board submitted an application to the USEPA requesting revisions to its NPDES Program in accordance with 40 CFR 122.28, 123.62, and 403.10. The application included a request to add general permit authority to its approved NPDES Program. On September 22, 1989, the USEPA, Region 9, approved the State Water Board's request and granted authorization for the State to issue general NPDES permits.

- D. **Background and Rationale for Requirements.** The State Water Board developed the requirements in this Order based on information submitted as part of the applications for several like agencies, through monitoring and reporting programs, and through special studies. Attachments A through F, which contain background information and rationale for Order requirements, are hereby incorporated into this Order and constitute part of the Findings for this Order.
- E. **California Environmental Quality Act (CEQA).** This action to adopt an NPDES permit is exempt from the provisions of CEQA (Public Resources Code section 21100, et seq.) in accordance with section 13389 of the CWC.
- F. **Technology-based Effluent Limitations (TBELs).** Title 40 of the CFR section 122.44(a) requires that permits include applicable **TBELs** and standards. This Order does not include numeric-**TBELs** because USEPA has not promulgated effluent limitation guidelines for utility vaults. Instead, this Order requires Pollution Prevention Practices (PPPs), which are equivalent to Best Management Practices (BMPs), in Pollution Prevention Plans (PLANS) to control and abate the discharge of pollutants to surface waters and to achieve Best Available Technology Economically Achievable (BAT)/Best Conventional Pollutant Control Technology (BCT) requirements and comply with applicable water quality standards.
- G. **Water Quality-based Effluent Limitations (WQBELs).** Section 122.44(d) of 40 CFR requires that permits include WQBELs to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water. Where numeric water quality criteria have not been established, 40 CFR section 122.44(d) specifies that WQBELs may be established using USEPA criteria guidance under CWA section 304(a), proposed State criteria or a State policy interpreting narrative criteria supplemented with other relevant information, or an indicator parameter. Section 122.44(k)(3) of 40 CFR allows the use of BMPs to control or abate the discharge of pollutants when numeric effluent limitations are infeasible or when practices are reasonably necessary to achieve effluent limitations and standards or to carry out the purposes and intent of the CWA. As discussed in detail in the Fact Sheet, it is not feasible to establish WQBELs for pollutants in discharges from utility vaults or

underground structures. Therefore, in lieu of WQBELs, this Order requires Dischargers to establish PPPs in PLANS for discharges from utility vaults and underground structures.

- H. **Water Quality Control Plans.** The Regional Water Boards have adopted Water Quality Control Plans (hereinafter Basin Plans) that designate beneficial uses, establish water quality objectives, and contain implementation programs and policies to achieve those objectives for all waters addressed through the plans. In addition, State Water Board Resolution No. 88-63 establishes state policy that all waters, with certain exceptions, should be considered suitable or potentially suitable for municipal and domestic supplies. Requirements of this Order specifically implement the applicable Basin Plans.
- I. **National Toxics Rule (NTR) and California Toxics Rule (CTR).** USEPA adopted the NTR on December 22, 1992, which was amended on May 4, 1995 and November 9, 1999, and the CTR on May 18, 2000, which was amended on February 13, 2001. These rules include water quality criteria for priority pollutants and are applicable to this discharge.
- J. **State Implementation Policy.** On March 2, 2000, the State Water Board adopted the *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (State Implementation Policy or SIP). The SIP became effective on April 28, 2000, with respect to the priority pollutant criteria promulgated for California by the USEPA through the NTR and to the priority pollutant objectives established by the Regional Water Boards in their Basin Plans, with the exception of the provision on alternate test procedures for individual discharges that have been approved by the USEPA Regional Administrator. The alternate test procedures provision was effective on May 22, 2000. The SIP became effective on May 18, 2000. The SIP includes procedures for determining the need for and calculating WQBELs and requires Dischargers to submit data sufficient to do so. As described in the Fact Sheet, Water Quality Order No. 2001-11-DWQ granted exceptions from sections 1.3 (Determination of Priority Pollutants Requiring WQBELs) and 1.4 (Calculations of Effluent Limitations) of the SIP because numeric effluent limitations are infeasible for discharges from utility vaults and underground structures. This Order continues the exceptions granted from sections 1.3 and 1.4 of the SIP.
- K. **Compliance Schedules and Interim Requirements. (Not applicable)**
- L. **Antidegradation Policy.** Section 131.12 of 40 CFR requires that State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16. Resolution No. 68-16 incorporates the federal antidegradation policy where the federal policy applies under federal law. Resolution No. 68-16 requires that existing quality of waters be maintained unless degradation is justified based on specific findings. The Regional Water Boards' Basin Plans implement, and incorporate by reference, both the State and federal antidegradation policies. As discussed in detail in the Fact Sheet, the permitted discharge is consistent with the antidegradation

provision of 40 CFR section 131.12 and State Water Board Resolution No. 68-16.

- M. **Anti-Backsliding Requirements.** Sections 402(o)(2) and 303(d)(4) of the CWA and federal regulations of 40 CFR section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require effluent limitations in a reissued permit to be as stringent as those in the previous permit, with some exceptions where limitations may be relaxed. All effluent limitations in this Order are at least as stringent as the effluent limitations in the previous Order.
- N. **Monitoring and Reporting.** Section 122.48 of 40 CFR requires that all NPDES permits specify requirements for recording and reporting monitoring results. Sections 13267 and 13383 of the CWC authorize the Regional Water Boards to require technical and monitoring reports. The Monitoring and Reporting Program (MRP) establishes monitoring and reporting requirements to implement federal and State requirements. This MRP is provided in Attachment E.
- O. **Standard and Special Provisions.** Standard Provisions, which in accordance with 40 CFR sections 122.41 and 122.42 apply to all NPDES discharges and must be included in every NPDES permit, are provided in Attachment D. The State Water Board has also included in this Order special provisions applicable to the Discharger. A rationale for the special provisions contained in this Order is provided in the attached Fact Sheet (Attachment F).
- P. **Notification of Interested Parties.** The State Water Board has notified the Dischargers and interested agencies and persons of its intent to prescribe WDRs for the discharge and has provided them with an opportunity to submit their written comments and recommendations. Details of notification are provided in the Fact Sheet of this Order.
- Q. **Consideration of Public Comment.** The State Water Board, in a public meeting, heard and considered all comments pertaining to the discharge. Details of the Public Hearing are provided in the Fact Sheet of this Order.
- R. **Alaska Rule.** On March 30, 2000, USEPA revised its regulation that specifies when new and revised State and Tribal water quality standards (WQS) become effective for CWA purposes (40 CFR section 131.21, 65 FR 24641, April 27, 2000). Under the revised regulation (also known as the Alaska rule), USEPA must approve new and revised standards submitted to USEPA after May 30, 2000 before being used for CWA purposes. The final rule also provides that standards already in effect and submitted to USEPA by May 30, 2000 may be used for CWA purposes, whether or not approved by USEPA.
- S. **Stringency of Requirements for Individual Pollutants.** This Order contains restrictions that are no more stringent than required by CWA. Restrictions consist of TBELs and WQBELs. The TBELs consist of PPPs as indicated in a PLAN. The permit's technology-based pollutant restrictions are no more stringent than required by the CWA. The narrative WQBELs have been scientifically derived to implement water quality objectives that protect beneficial uses. Both the beneficial uses and the water

quality objectives have been approved pursuant to federal law and are the applicable federal WQS. Collectively, this Order's restrictions are no more stringent than required to implement the technology-based requirements of the CWA and the applicable WQS for purposes of the CWA.

#### **IV. DISCHARGE PROHIBITIONS**

- A. The discharge of wastewater at a location or in a manner different from that described in the Findings is prohibited.
- B. The discharge of wastewater shall not create or cause conditions of nuisance or pollution.
- C. The discharge shall not cause, have a reasonable potential to cause, or contribute to an in-stream excursion above any applicable criterion promulgated by USEPA pursuant to section 303 of the CWA, or water quality objective adopted by the State or Regional Water Boards.

#### **V. EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS**

- A. Effluent Limitations (Not Applicable)**
- B. Land Discharge Specifications (Not Applicable)**
- C. Reclamation Specifications (Not Applicable)**

#### **VI. RECEIVING WATER LIMITATIONS**

##### **A. Surface Water Limitations**

Receiving water limitations are based on water quality objectives contained in the Basin Plans and are a required part of this Order. The discharge shall not cause the following in the surface receiving water:

1. Concentrations of dissolved oxygen (DO) in the receiving waters to fall below 7.0 milligrams (mg/L). During any period when the receiving water DO concentration is already below 7.0 mg/L, the discharge shall not cause any further depression of the DO content.
2. Oils, greases, waxes, floating material (liquids, solids, foams, and scum), or suspended material to create a nuisance or adversely affect beneficial uses.
3. Alteration of the apparent color, taste, or odor beyond present natural background levels.

4. Biostimulatory substances to be present in concentrations that promote aquatic growths to the extent that such growths cause nuisance or adversely affect beneficial uses.
5. Turbidity in amounts that adversely affect beneficial uses in the receiving waters. Turbidity shall not increase more than 20 percent over background levels.
6. The ambient pH to fall below 6.5 or exceed 9.0.
7. Deposition of material that causes a nuisance or adversely affects beneficial uses.
8. Significant erosion or alteration of the watercourse.
9. The ambient receiving water temperature to be altered more than 5<sup>0</sup> F.
10. Total residual chlorine to be present at concentrations that are detectable using approved methods as specified in 40 CFR section 136.
11. Taste or odor-producing substances that impart undesirable tastes or odors to fish flesh or other edible products of aquatic origin or cause nuisance or adversely affect beneficial uses.
12. Radionuclides to be present in concentrations that exceed maximum contaminant levels specified in the California Code of Regulations (CCR), Title 22, that harm human, plant, animal, or aquatic life, or that result in the accumulation of radionuclides in the food web to an extent that presents a hazard to human, plant, animal, or aquatic life.
13. Toxic pollutants to be present in the water column, sediments, or biota in concentrations that adversely affect beneficial uses, that produce a detrimental response in human, plant, animal, or aquatic life, or that bioaccumulate in aquatic resources at levels harmful to human health.
14. Violation of any applicable water quality objective for receiving waters adopted by the State or applicable Regional Water Board or applicable water quality criterion adopted by USEPA pursuant to section 303 of the CWA.

These limitations apply unless more stringent provisions exist in either the Basin Plan or an applicable State plan. The more stringent limitation shall apply.

**B. Groundwater Limitations (Not Applicable)**

## VII. PROVISIONS

### A. Standard Provisions

1. The Discharger shall comply with all Standard Provisions included in Attachment D of this Order.
2. **State Water Board Standard Provisions.** The Discharger shall comply with the following provisions:

For the Regional Water Board to receive immediate and accurate information regarding all points of discharge, the Discharger shall establish and maintain a liaison contact with the appropriate Regional Water Board. The Discharger must send the Regional Water Board(s) a list of designated liaison personnel, telephone number(s), and specific area(s) of responsibility within 30 days from the date of submittal of the NOI and after any update to the list.

A copy of this General Permit and the PLAN shall be kept where key operating personnel can refer to the documents. Key operating and site management personnel shall be familiar with its contents.

The Discharger is required to retain records, including all monitoring information and copies of all reports required by this General Permit, for five years unless directed otherwise by a Regional Water Board.

This General Permit expires on **July 19, 2011**. Those enrollees who are covered under this General Permit at the time of expiration will continue to be covered under this General Permit until permit coverage becomes effective under the reissued General Permit unless an NOTT has been submitted to terminate coverage. Re-enrollees must complete, submit, and have their PLAN approved by a Regional Water Board Executive Officer or adopted by a Regional Water Boards if a hearing is requested, by the effective date to maintain coverage after January 1, 2007.

### B. Monitoring and Reporting Program Requirements

The Discharger shall comply with the MRP, and future revisions thereto, in Attachment E of this Order.

### C. Special Provisions

1. **Reopener Provisions (Not Applicable)**
2. **Special Studies, Technical Reports and Additional Monitoring Requirements (Not Applicable)**

### **3. Best Management Practices and Pollution Prevention Plan (PLAN)**

- a. Similar to BMPs, PPPs are designed to prevent or control the discharge of pollutants. They may include a schedule of activities, prohibition of practices, maintenance procedures, or other management practices. A PLAN is a written document that describes the operator's activities to comply with the requirements in the General Permit. The PLAN is intended to evaluate potential pollutant sources at the site and select and implement appropriate measures designed to prevent or control the discharge of pollutants.
- b. Standard industrywide PPPs have not been developed for utility companies. The Discharger shall prepare a PLAN and implement it whenever there is a discharge. If standard industrywide PPPs are developed, then the Discharger may utilize those PPPs or develop a PLAN utilizing selected standard industrywide PPPs, as appropriate. All PLANs developed by utility companies must meet the minimum specifications as described below.
- c. If an exceedance(s) of a receiving water limitation defined in "Section V. Receiving Water Limitations," expressed as either narrative or numerical, has been identified by the Discharger or by the Regional Water Board as a result of a utility company discharge, either of the following actions shall be undertaken to ensure compliance with this General Permit:
  - i. The Discharger shall submit a new PLAN, which demonstrates to the satisfaction of the Regional Water Board that the Discharger is fully in compliance with "VII.3. Pollution Prevention Practices & Pollution Prevention Plan" above and implementation of the new PLAN will prevent future exceedance(s) of the receiving water limits; or
  - ii. The Discharger shall develop and submit a revised PLAN to Regional Water Board, with new or revised PPPs, to prevent future exceedance(s). The Discharger shall implement such PPPs and document the progress of implementation and effectiveness thereof in the Annual Report to the Regional Water Board Executive Officer.
- d. Dischargers who are enrolling for the first time under this General Permit must submit the PLAN together with the NOI, map, and annual fee, as described in II.A. (Notification Requirements) above, to the State Water Board. Re-enrollees shall submit a copy of their previous PLAN, or if new information warrants, shall submit a revised or new PLAN as part of their application for coverage under this General Permit. The Discharger must indicate in the NOI the location where the PLAN is to be maintained and identify the appropriate contact person, with telephone number, for the PLAN. The Discharger must revise the PLAN as requested by the Regional Water Board.

- e. The PLAN shall include, to the extent possible, at least the following items:
- i. Provisions for Scheduled Discharges, Unscheduled Discharges, Reservoir Discharges (if any), and Emergency Operation Discharges.
  - ii. **Pollution Prevention Team.** Each PLAN shall identify a specific individual or individuals within the utility's organization as members of a Pollution Prevention Team that are responsible for developing the PLAN and assisting the utility or plant manager in its implementation, maintenance, and revision. The PLAN shall clearly identify the responsibilities of each team member. The activities and responsibilities of the team shall address all aspects of the utility's PLAN.
  - iii. **Description of Potential Pollutant Sources.** Each PLAN shall provide a description of potential sources that may add significant amounts of pollutants to discharges. Each PLAN shall identify all activities and significant materials that may potentially be significant pollutant sources. Each PLAN shall include at a minimum:
    - a) **Drainage map.** Provide a map showing the essential features of the distribution system for the service area within a specific Regional Water Board boundary and showing the corresponding surface waters to which water may be discharged.
    - b) **Inventory of Exposed Materials.** Include an inventory of the types of materials handled at the site that potentially may be exposed to precipitation. Such inventory shall include a description of significant materials that have been handled, treated, stored or disposed in a manner to allow exposure to storm water from 3 years prior to the submission of the NOI for coverage under this General Permit and the present; method and location of onsite storage or disposal; materials management practices employed to minimize contact of materials with storm water runoff from 3 years prior to the submission of the NOI for coverage under this General Permit and the present; the location and a description of existing structural and nonstructural control measures to reduce pollutants in storm water runoff; and a description of any treatment the storm water receives.
    - c) **Spills and Leaks.** Include a list of significant spills and significant leaks of toxic or hazardous pollutants that occurred at areas exposed to precipitation or that otherwise enter the discharge stream from 3 years prior to the date of the submission of NOI to be covered under this General Permit. The list shall be updated as appropriate during the term of this General Permit.

d) **Risk Identification and Summary of Potential Pollutant Sources.**

Include a narrative description of the potential pollutant sources, such as from significant dust or particulate generating processes. The description shall specifically list any significant potential source of pollutants at the site and, for each potential source; any pollutant or pollutant parameter (for example, oil and grease, etc.) of concern shall be identified.

iv. **Measures and Controls.** Each discharger covered by this General Permit shall develop a description of PPPs appropriate for the site(s), and implement such controls. The appropriateness and priorities of PPPs in a PLAN must reflect identified potential sources of pollutants at the site. Also, the Discharger should discuss the advantages and limitations of the PPP. If relevant, include a structural diagram. The description of wastewater management controls shall address the following minimum components, including a schedule for implementing such controls:

- a) **Good Housekeeping.** Maintain areas that may contribute pollutants to discharges so that they are kept clean and orderly. Store and contain liquid materials in such a manner that if the container is ruptured, the contents will not discharge, flow, or be washed into the storm drainage system, surface waters, or groundwater.
- b) **Preventive Maintenance.** Inspect and maintain wastewater management devices as well as inspect and test site equipment and systems to uncover conditions that could cause breakdowns or failures resulting in discharges of pollutants to surface waters, and ensure appropriate maintenance of such equipment and systems.
- c) **Spill Prevention and Response Procedures.** Identify areas where potential spills, which can contribute pollutants to discharge, can occur and their accompanying drainage points. Specify material handling procedures, storage requirements, and use of equipment. Make accessible to the appropriate personnel the procedures for cleaning up spills identified in the PLAN. Make accessible the necessary equipment to implement a clean up. Note that if the spilled material is hazardous, then the cleanup materials used are also hazardous and should be disposed of properly. For large spills, a private spill cleanup company or Hazmat may be necessary.
- d) **Inspections.** Identify qualified personnel, by name or by job title, to inspect designated equipment and areas of the site, and ensure that appropriate actions are taken in response to the inspections. Maintain records of inspections. Inventory and inspect each discharge point during dry weather.
- e) **Employee Training.** Train employees to implement activities identified in the PLAN. Address topics such as spill response, good housekeeping,

and material management practices. Identify how often training will take place.

- f) **Record Keeping and Internal Reporting Procedures.** Federal regulation requires that any oil spill into a water body be reported to the National Response Center at (800) 424-8802 (24 hours). The Discharger shall report spills to the appropriate local agency, such as the fire department, to assist in cleanup. Provide a description of incidents (such as spills or other discharges), along with other information describing the quality and quantity of discharges. Document patterns in time of occurrence, mode of dumping, responsible parties, date and time of incident, weather conditions, duration and cause of spill/leak/discharge, response procedures, resulting environmental problems and persons notified. Document inspections and maintenance activities and maintain records of such activities. Include the date and time the inspection was performed, the name of the inspector, and the items inspected. If problems are noted, include the corrective action required and the date the action was taken.
  - g) **Sediment and Erosion Control.** Identify areas that, due to topography, activities, or other factors, have a high potential for significant soil erosion, and identify structural, vegetative, and/or stabilization measures to be used to limit erosion.
  - h) **Management of Runoff.** Include a narrative consideration of the appropriateness of traditional storm water management practices (practices other than those that control the generation or source(s) of pollutants) used to divert, infiltrate, reuse, or otherwise manage runoff in a manner that reduces pollutants in discharges from the site. The PLAN shall provide measures that the Discharger determines to be reasonable and appropriate measures.
- v. **Comprehensive Site Compliance Evaluation.** Qualified personnel shall conduct site compliance evaluations upon each discharge event. Such evaluations shall provide:
- a) The Discharger shall visually inspect for evidence of, or the potential for, pollutants entering the receiving water(s). Evaluate measures to reduce pollutant loadings to determine whether they are adequate and properly implemented in accordance with the terms of this General Permit or whether additional control measures are needed. Ensure that structural wastewater management measures, sediment and erosion control measures, and other structural PPPs identified in the PLAN are operating correctly. Perform a visual inspection of equipment needed to implement the PLAN, such as spill response equipment.

- b) Based on the results of the evaluation, the Discharger shall revise, as appropriate, the description of potential pollutant sources identified in the PLAN in accordance with Item iii of this section (Description of Potential Pollutant Sources) and PPPs identified in the PLAN with Item iv of this section (Measures and Controls) within two weeks of such evaluation and shall provide timely implementation of any changes to the PLAN.
  - c) Write and retain for 3 years, a report summarizing the scope of the evaluation, personnel making the evaluation, the date(s) of the evaluation, major observations relating to the implementation of the PLAN, and actions taken in accordance with Item iv.b, above. Identify any incidents of noncompliance or certify that the site(s) is in compliance with the PLAN and this General Permit. The report shall be signed in accordance with signatory requirements of this General Permit.
- f. Additional Requirements include:
- i. The PLAN shall be designed to comply with BAT/BCT and to ensure compliance with WQS.
  - ii. The Discharger shall amend the PLAN whenever there is a change in construction, operation, or maintenance, when such amendment is necessary to ensure compliance with BAT/BCT and receiving water limits. The PLAN shall also be amended if it is in violation of any conditions of this General Permit or has not achieved the general objective of controlling pollutants in discharges to surface waters. The Discharger shall submit the amended PLAN to the Regional Water Board.
  - iii. The PLAN and any amendments thereto shall be certified in accordance with the signatory requirements of Standard Provision B.2.

**4. Compliance Schedules (Not Applicable)**

**5. Construction, Operation and Maintenance Specifications (Not Applicable)**

**6. Special Provisions for Municipal Facilities (POTWs Only) (Not Applicable)**

**7. Other Special Provisions**

- a. Following adoption of this General Permit, Regional Water Boards shall review monitoring reports, review revisions to Discharges PLANs, conduct compliance inspections, and take enforcement actions.
- b. The Dischargers shall dispose of solids removed from liquid wastes in a manner that is consistent with Title 27, of the CCR and approved by the appropriate Regional Water Board's Executive Office.

**VIII. COMPLIANCE DETERMINATION (NOT APPLICABLE)**

## ATTACHMENT A – DEFINITIONS

**Notice of Exclusion (NOE):** A one-page notice that indicates that the proposed Discharger is NOT eligible for coverage under this General Permit and states the reason behind the decision.

**Notice of Intent (NOI):** A form completed and signed by an industrial utility owner/operator notifying the State and Regional Water Boards that the operator will comply with the General Permit for an industrial activity at a specific utility or site.

**Notice of Termination or Transfer (NOTT):** A form completed and signed by a utility operator notifying the State and Regional Water Boards that the owner/operator no longer wishes to operate under the General Permit. Submission of an NOTT constitutes notice that the owner (and his/her agent) of the utility identified on the form is no longer authorized to discharge wastewater associated with utility company maintenance activities under this General Permit.

**Pollution Prevention Plan (PLAN):** A written document that describes the operator's activities to comply with the requirements in this General Permit. The PLAN is intended to facilitate a process whereby the operator evaluates potential pollutant sources at the site and selects and implements appropriate measures designed to prevent or control the discharge of pollutants, such as PPPs.

**Pollution Prevention Practices (PPP):** Similar to Best Management Practices (BMP), PPPs are permit conditions used in place of or in conjunction with effluent limitations to prevent or control the discharge of pollutants. These may include a schedule of activities, prohibition of practices, maintenance procedures, or other management practices. PPPs may include, but are not limited to, employee training, treatment requirements, operating procedures, or practices to control plant site runoff, spillage, leaks, sludge or waste disposal, or drainage from raw material storage.

**Utility Company:** Any person, as defined in section 13050 of the California Water Code, whose business is to supply the resources, excluding water, necessary for day to day living and/or operations. This includes, but is not limited to, suppliers of natural gas, electricity, and telephone services.

## VII. TYPE (Check All That Apply)

|                                   |                                      |                                    |                                 |
|-----------------------------------|--------------------------------------|------------------------------------|---------------------------------|
| <input type="checkbox"/> Electric | <input type="checkbox"/> Natural Gas | <input type="checkbox"/> Telephone | <input type="checkbox"/> Other: |
|-----------------------------------|--------------------------------------|------------------------------------|---------------------------------|

## VIII. POLLUTION PREVENTION PRACTICES PLAN INFORMATION

|   |           |                |                            |          |

| A. Company Name                         |           |                | B. Contact Person          |          |
| C. Street Address Where PLAN is Located |           |                | D. Title of Contact Person |          |
| E. City                                 | F. County | G. State<br>CA | H. Zip Code                | I. Phone |

## IX. DESCRIPTION OF DISCHARGE

|   |
|---|
| Describe the discharge(s) proposed. List any potential pollutants in the discharge. Attach additional sheets if needed. |
|---|

## X. VICINITY MAP AND FEE

|   |                              |  |
|---|------------------------------|--|
| A. Have you included vicinity map(s) with this submittal?   | <input type="checkbox"/> Yes | <input type="checkbox"/> No                              |
| Separate vicinity maps must be submitted for each Region where a proposed discharge will occur.     |                              |  |
| B. Have you included payment of the filing fee (for first-time enrollees only) with this submittal? | <input type="checkbox"/> Yes | <input type="checkbox"/> No <input type="checkbox"/> N/A |
| C. Have you included your PLAN?   | <input type="checkbox"/> Yes | <input type="checkbox"/> No                              |

## XI. CERTIFICATION

|   |          |
|---|----------|
| <p>"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to ensure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those directly responsible for gathering the information, the information submitted is true, accurate, and complete to the best of my knowledge and belief. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment. In addition, I certify that the provisions of the permit, including the criteria for eligibility and the development and implementation of Pollution Prevention Practices, if required, will be complied with."</p> |          |
| A. Printed Name:  |          |
| B. Signature:   | C. Date: |
| D. Title:   |          |

**PLEASE SUBMIT THE NOI, FIRST ANNUAL FEE, PLAN AND MAP TO THE FOLLOWING ADDRESS:**

**UTILITIES NOI**  
**NPDES UNIT**  
**DIVISION OF WATER QUALITY**  
**STATE WATER RESOURCES CONTROL BOARD**  
**P.O. BOX 100**  
**SACRAMENTO, CA 95812-0100**

## STATE USE ONLY

|       |                       |                            |                     |
|-------|-----------------------|----------------------------|---------------------|
| WDID: | Regional Board Office | Date NOI Received:         | Date NOI Processed: |
|       |                       | Fee Amount Received:<br>\$ | Check #:            |

## **ATTACHMENT C – INSTRUCTIONS FOR COMPLETING THE NOI**

### **WATER QUALITY ORDER NO. 2006-0008-DWQ STATEWIDE GENERAL NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT FOR DISCHARGES FROM UTILITY VAULTS & UNDERGROUND STRUCTURES TO SURFACE WATERS OF THE UNITED STATES GENERAL PERMIT NO. CAG990002**

These instructions are intended to help you, the Discharger, complete the NOI form for General Permit No. CAG990002. **Please print clearly or type when completing the NOI form and vicinity map(s). Illegible applications will not be processed.** For any field, if more space is needed, submit a supplementary letter with the NOI.

Send the completed and signed form, filing fee, PLAN, supporting documentation, and vicinity map(s) to the State Water Resources Control Board (State Water Board). Submit one permit application to cover all discharges within the boundaries of a Regional Water Quality Control Board (Regional Water Board). If the proposed discharges occur in more than one Region, submit a permit application for each Region where a discharge will occur. Only one annual fee is required.

#### **Section I – Notice of Intent Status**

Indicate whether this request is for first time coverage or a change of information for a utility already covered under this General Permit. For a change of information, enter the eleven-digit Waste Discharge Identification (WDID) number for the utility.

#### **Section II – Owner/Operator**

- A. Name** – Enter the name of the owner/operator. Check the appropriate box for which type of agency best describes the owner/operator. "Gov. Combo." is an abbreviation for "Government Combination" for a joint powers agency created by two or more government agencies. Private businesses should check the "Private" box.
- B. Mailing Address** – Enter the street number and name where correspondence should be sent (P.O. Box is acceptable).
- C. City** – Enter the city that applies to the mailing address given.
- D. County** – Enter the county that applies to the mailing address given.
- E. State** – Enter the state that applies to the mailing address given.
- F. Zip Code** – Enter the zip code that applies to the mailing address given.
- G. Contact Person** – Enter the name (first and last) of the contact person.
- H. Title** – Enter the contact person's title.
- I. Telephone** – Enter the daytime telephone number of the contact person.

**Additional Owners** - Please check this box if there is more than one owner/operator and list.

### **Section III – Billing Address**

**Send To:** - Check the appropriate box and enter the information **only** if it is different from section II. above.

- A. Name** – Enter the name (first and last) of the person who will be responsible for the billing.
- B. Title** – Enter the title of the person responsible for the billing.
- C. Mailing Address** – Enter the street number and name where the billing should be sent  
(P.O. Box is acceptable).
- D. City** – Enter the city that applies to the billing address.
- E. County** – Enter the county that applies to the billing address.
- F. State** – Enter the state that applies to the billing address.
- G. Zip Code** – Enter the zip code that applies to the billing address.

### **Section IV – Receiving Water Information**

- A. Enter the names(s) of the waterbody to which the wastewater is discharged.
- B. Describe the type(s) of receiving waters affected (river, lake, creek, stream, bay, ocean, wetland).
- C. List all Region numbers where discharge is proposed. Regional Water Board boundaries are defined in section 13200 of the California Water Code. Each Region number is given below and a map is attached to these instructions. For coverage in Region 5, send two additional copies of the map and for coverage in Region 6, send one additional copy.

|                          |  |  |
|--------------------------|--|--|
| 1 - North Coast          | 2 - San Francisco Bay                            | 3 - Central Coast                            |
| 4 - Los Angeles          | 5 - Central Valley (Sacramento, Fresno, Redding) | 6 - Lahontan (South Lake Tahoe, Victorville) |
| 7 - Colorado River Basin | 8 - Santa Ana                                    | 9 - San Diego                                |

### **Section V - Land Disposal/Reclamation**

Check “YES” if land disposal and/or reclamation is/are feasible. If you check “YES,” contact the appropriate Regional Water Board. Your discharge may not be covered under the NPDES Program. If you checked “NO,” explain in the space provided the reason why these alternatives are not feasible.

### **Section VI – Verification**

Indicate by checking “YES” or “NO” whether verification has been done to determine if the discharge(s) are in compliance with prohibitions or orders of the Regional Water Board.

### **Section VII - Type**

Check the appropriate box(s) to indicate the type of utility for which you are seeking coverage.

### **Section VIII - Pollution Prevention Plan (PLAN) Information**

- A. **Company Name** – Enter the legal name of the company applying for coverage.
- B. **Contact Person** – List the company contact person responsible for preparation and implementation of the PLAN.
- C. **Street Address Where the PLAN is Located** - Indicate the street number and name where you will keep the PLAN for reference and review by personnel.
- D. **Title of Contact Person** – Enter the official company title of the contact person.
- E. **City** – Enter the city where the PLAN will be kept.
- F. **County** – Enter the county where the PLAN will be kept.
- G. **State** – Enter the state where the PLAN will be kept.
- H. **Zip Code** – Enter the city zip code where the PLAN will be kept.
- I. **Telephone** – Enter the daytime telephone number of the contact person.

### **Section IX- Description of Discharge**

Describe the types of operations that occur and potential pollutants that may be found in the discharge.

### **Section X – Vicinity Map and Fee**

- A. If you have included vicinity map(s) with your NOI submittal, check the “YES” box. If not included, check “NO.” **NOTE: Vicinity map(s) of the proposed discharge site must be received before you can obtain coverage under this General Permit.** Submit separate vicinity map(s) for each Regional Water Board where a discharge is proposed. If applying for coverage in the Central Valley Region, send two additional copies of the required map and if applying for coverage under Lahontan Region, send one additional copy of the required map.

The map must show the essential features of the distribution system for the service area within a specific Regional Water Board boundary and show the corresponding surface waters to which water may be discharged.

- B. Check “YES” if you have included the annual fee with your submittal. Check “NO” if you have not included payment. **NOTE: Payment of this fee must be received before you can obtain coverage under this General Permit.** You will be invoiced annually and payment is required to continue coverage.
- C. Check “YES” if you have included the PLAN. Otherwise, check “NO.” **NOTE: You must submit the PLAN to the State Water Board and appropriate Regional Water Board(s) to obtain coverage under this General Permit.**

**Section XI - Certification**

- A. Printed Name** – Print your name legibly. The person responsible according to the Signatory Requirements section of the Standard Provisions (Attachment D) must fill out this section.
- B. Signature** – Provide a signature of name printed above.
- C. Date** – Indicate the date signed.
- D. Title** – Include the professional title of the person signing the NOI.

GENERAL NATIONAL POLLUTANT DISCHARGE ELIMINATION SYSTEM (NPDES) PERMIT  
FOR DISCHARGES FROM UTILITY VAULTS AND UNDERGROUND STRUCTURES TO SURFACE WATERS  
ORDER NO. 2006-0008-DWQ  
NPDES NO. CAG990002

### CALIFORNIA ENVIRONMENTAL PROTECTION AGENCY

Linda S. Adams, Agency Secretary

### STATE WATER RESOURCES CONTROL BOARD

Tam M. Doduc, Board Chair

## **ATTACHMENT D – STANDARD PROVISIONS**

### **I. STANDARD PROVISIONS – PERMIT COMPLIANCE**

#### **A. Duty to Comply**

1. The Discharger must comply with all of the conditions of this Order. Any noncompliance constitutes a violation of the Clean Water Act (CWA) and the California Water Code (CWC) and is grounds for enforcement action, for permit termination, revocation and reissuance, or denial of a permit renewal application [40 CFR §122.41(a)].
2. The Discharger shall comply with effluent standards or prohibitions established under section 307(a) of the CWA for toxic pollutants and with standards for sewage sludge use or disposal established under section 405(d) of the CWA within the time provided in the regulations that establish these standards or prohibitions, even if this Order has not been modified to incorporate the requirement [40 CFR §122.41(a)(1)].

#### **B. Need to Halt or Reduce Activity Not a Defense**

It shall not be a defense for a Discharger in an enforcement action that it would have been necessary to halt or reduce the permitted activity in order to maintain compliance with the conditions of this Order [40 CFR §122.41(c)].

#### **C. Duty to Mitigate**

The Discharger shall take all reasonable steps to minimize or prevent any discharge or sludge use or disposal in violation of this Order that has a reasonable likelihood of adversely affecting human health or the environment [40 CFR §122.41(d)].

#### **D. Proper Operation and Maintenance**

The Discharger shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the Discharger to achieve compliance with the conditions of this Order. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of backup or auxiliary facilities or similar systems that are installed by a Discharger only when necessary to achieve compliance with the conditions of this Order [40 CFR §122.41(e)].

#### **E. Property Rights**

1. This Order does not convey any property rights of any sort or any exclusive privileges [40 CFR §122.41(g)].

2. The issuance of this Order does not authorize any injury to persons or property or invasion of other private rights, or any infringement of State or local law or regulations [40 CFR §122.5(c)].

## **F. Inspection and Entry**

The Discharger shall allow the Regional Water Quality Control Board (Regional Water Board), State Water Resources Control Board (State Water Board), United States Environmental Protection Agency (USEPA), and/or their authorized representatives (including an authorized contractor acting as their representative), upon the presentation of credentials and other documents, as may be required by law, to [40 CFR §122.41(i)] [CWC 13383(c)]:

1. Enter upon the Discharger's premises where a regulated facility or activity is located or conducted, or where records are kept under the conditions of this Order [40 CFR §122.41(i)(1)];
2. Have access to and copy, at reasonable times, any records that must be kept under the conditions of this Order [40 CFR §122.41(i)(2)];
3. Inspect and photograph, at reasonable times, any facilities, equipment (including monitoring and control equipment), practices, or operations regulated or required under this Order [40 CFR §122.41(i)(3)];
4. Sample or monitor, at reasonable times, for the purposes of assuring Order compliance or as otherwise authorized by the CWA or the CWC, any substances or parameters at any location [40 CFR §122.41(i)(4)].

## **G. Bypass**

1. Definitions
  - a. "Bypass" means the intentional diversion of waste streams from any portion of a treatment facility [40 CFR §122.41(m)(1)(i)].
  - b. "Severe property damage" means substantial physical damage to property, damage to the treatment facilities, which causes them to become inoperable, or substantial and permanent loss of natural resources that can reasonably be expected to occur in the absence of a bypass. Severe property damage does not mean economic loss caused by delays in production [40 CFR §122.41(m)(1)(ii)].
2. Bypass not exceeding limitations – The Discharger may allow any bypass to occur which does not cause exceedances of effluent limitations, but only if it is for essential maintenance to assure efficient operation. These bypasses are not subject to the provisions listed in Standard Provisions – Permit Compliance I.G.3 and I.G.5 below [40 CFR §122.41(m)(2)].

3. Prohibition of bypass – Bypass is prohibited, and the Regional Water Board may take enforcement action against a Discharger for bypass, unless [40 CFR §122.41(m)(4)(i)]:
  - a. Bypass was unavoidable to prevent loss of life, personal injury, or severe property damage [40 CFR §122.41(m)(4)(A)];
  - b. There were no feasible alternatives to the bypass, such as the use of auxiliary treatment facilities, retention of untreated wastes, or maintenance during normal periods of equipment downtime. This condition is not satisfied if adequate back-up equipment should have been installed in the exercise of reasonable engineering judgment to prevent a bypass that occurred during normal periods of equipment downtime or preventive maintenance [40 CFR §122.41(m)(4)(B)]; and
  - c. The Discharger submitted notice to the Regional Water Board as required under Standard Provision – Permit Compliance I.G.5 below [40 CFR §122.41(m)(4)(C)].
4. The Regional Water Board may approve an anticipated bypass, after considering its adverse effects, if the Regional Water Board determines that it will meet the three conditions listed in Standard Provisions – Permit Compliance I.G.3 above [40 CFR §122.41(m)(4)(ii)].
5. Notice
  - a. Anticipated bypass. If the Discharger knows in advance of the need for a bypass, it shall submit a notice, if possible at least 10 days before the date of the bypass [40 CFR §122.41(m)(3)(i)].
  - b. Unanticipated bypass. The Discharger shall submit notice of an unanticipated bypass as required in Standard Provisions - Reporting V.E below [40 CFR §122.41(m)(3)(ii)].

## H. Upset

Upset means an exceptional incident in which there is unintentional and temporary noncompliance with technology based permit effluent limitations because of factors beyond the reasonable control of the Discharger. An upset does not include noncompliance to the extent caused by operational error, improperly designed treatment facilities, inadequate treatment facilities, lack of preventive maintenance, or careless or improper operation [40 CFR §122.41(n)(1)].

1. Effect of an upset. An upset constitutes an affirmative defense to an action brought for noncompliance with such technology based permit effluent limitations if the requirements of paragraph H.2 of this section are met. No determination made during administrative review of claims that noncompliance was caused by upset,

and before an action for noncompliance, is final administrative action subject to judicial review [40 CFR §122.41(n)(2)].

2. Conditions necessary for a demonstration of upset. A Discharger who wishes to establish the affirmative defense of upset shall demonstrate, through properly signed, contemporaneous operating logs or other relevant evidence that [40 CFR §122.41(n)(3)]:
  - a. An upset occurred and that the Discharger can identify the cause(s) of the upset [40 CFR §122.41(n)(3)(i)];
  - b. The permitted facility was, at the time, being properly operated [40 CFR §122.41(n)(3)(i)];
  - c. The Discharger submitted notice of the upset as required in Standard Provisions – Reporting V.E.2.b [40 CFR §122.41(n)(3)(iii)]; and
  - d. The Discharger complied with any remedial measures required under Standard Provisions – Permit Compliance I.C above [40 CFR §122.41(n)(3)(iv)].
3. Burden of proof. In any enforcement proceeding, the Discharger seeking to establish the occurrence of an upset has the burden of proof [40 CFR §122.41(n)(4)].

## **II. STANDARD PROVISIONS – PERMIT ACTION**

### **A. General**

This Order may be modified, revoked and reissued, or terminated for cause. The filing of a request by the Discharger for modification, revocation and reissuance, or termination, or a notification of planned changes or anticipated noncompliance does not stay any Order condition [40 CFR §122.41(f)].

If any toxic effluent standard or prohibition (including any schedule of compliance specified in such effluent standard or prohibition) is promulgated under section 307(a) of the CWA for a toxic pollutant which is present in the discharge, and that standard or prohibition is more stringent than any limitation on the pollutant in this General permit, this General Permit shall be modified or revoked and reissued to conform to the toxic effluent standard or prohibition and the Discharger so notified.

### **B. Duty to Reapply**

If the Discharger wishes to continue an activity regulated by this Order after the expiration date of this Order, the Discharger must apply for and obtain a new permit [40 CFR §122.41(b)].

### **C. Transfers**

This Order is not transferable to any person except after notice to the Regional Water Board. The Regional Water Board may require modification or revocation and reissuance of the Order to change the name of the Discharger and incorporate such other requirements as may be necessary under the CWA and the CWC [40 CFR §122.41(l)(3)] [40 CFR §122.61].

### **D. Severability**

The provisions of this General Permit are severable and if any provisions of this General Permit or the application of any provisions of this General Permit to any circumstance is held invalid, the applications of such provision to other circumstances and the remainder of this General Permit shall not be affected thereby.

### **E. Pollution, Contamination, or Nuisance [CWC §13050].**

Neither the treatment nor the discharge shall create a condition of pollution, contamination or nuisance.

## **III. STANDARD PROVISIONS – MONITORING**

- A.** Samples and measurements taken for the purpose of monitoring shall be representative of the monitored activity [40 CFR §122.41(j)(1)].
- B.** Monitoring results must be conducted according to test procedures under 40 CFR section 136 or, in the case of sludge use or disposal, approved under 40 CFR section 136 unless otherwise specified in 40 CFR section 503 unless other test procedures have been specified in this Order [40 CFR §122.41(j)(4)] [40 CFR §122.44(i)(1)(iv)].

## **IV. STANDARD PROVISIONS – RECORDS**

- A.** Except for records of monitoring information required by this Order related to the Discharger's sewage sludge use and disposal activities, which shall be retained for a period of at least five years (or longer as required by 40 CFR section 503), the Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least three (3) years from the date of the sample, measurement, report or application. This period may be extended by request of the Regional Water Board Executive Officer at any time [40 CFR §122.41(j)(2)].

### **B. Records of monitoring information shall include:**

- 1. The date, exact place, and time of sampling or measurements [40 CFR §122.41(j)(3)(i)];

2. The individual(s) who performed the sampling or measurements [40 CFR §122.41(j)(3)(ii)];
3. The dimensions, size and/or volume of vault;
4. The duration of the discharge;
5. The estimated volume of discharge;
6. The date(s) analyses were performed [40 CFR §122.41(j)(3)(iii)];
7. The individual(s) who performed the analyses [40 CFR §122.41(j)(3)(iv)];
8. The analytical techniques or methods used [40 CFR §122.41(j)(3)(v)]; and
9. The results of such analyses [40 CFR §122.41(j)(3)(vi)].

**C. Claims of confidentiality for the following information will be denied [40 CFR §122.7(b)]:**

1. The name and address of any permit applicant or Discharger [40 CFR §122.7(b)(1)]; and
2. Permit applications and attachments, permits and effluent data [40 CFR §122.7(b)(2)].

**V. STANDARD PROVISIONS – REPORTING**

**A. Duty to Provide Information**

The Discharger shall furnish to the Regional Water Board, State Water Board, or USEPA within a reasonable time, any information which the Regional Water Board, State Water Board, or USEPA may request to determine whether cause exists for modifying, revoking and reissuing, or terminating this Order or to determine compliance with this Order. Upon request, the Discharger shall also furnish to the Regional Water Board, State Water Board, or USEPA copies of records required to be kept by this Order [40 CFR §122.41(h)] [CWC 13267].

**B. Signatory and Certification Requirements**

1. All applications, reports, or information submitted to the Regional Water Board, State Water Board, and/or USEPA shall be signed and certified in accordance with paragraph (B.2) and (B.3) of this provision [40 CFR §122.41(k)].
2. All permit applications shall be signed as follows:
  - a. For a corporation: By a responsible corporate officer. For the purpose of this section, a responsible corporate officer means: (i) A president, secretary,

- treasurer, or vice-president of the corporation in charge of a principal business function, or any other person who performs similar policy- or decision-making functions for the corporation, or (ii) the manager of one or more manufacturing, production, or operating facilities, provided the manager is authorized to make management decisions which govern the operation of the regulated facility including having the explicit or implicit duty of making major capital investment recommendations, and initiating and directing other comprehensive measures to assure long term environmental compliance with environmental laws and regulations; the manager can ensure that the necessary systems are established or actions taken to gather complete and accurate information for permit application requirements; and where authority to sign documents has been assigned or delegated to the manager in accordance with corporate procedures [40 CFR §122.22(a)(1)];
- b. For a partnership or sole proprietorship: by a general partner or the proprietor, respectively [40 CFR §122.22(a)(2)]; or
  - c. For a municipality, State, federal, or other public agency: by either a principal executive officer or ranking elected official. For purposes of this provision, a principal executive officer of a federal agency includes: (i) the chief executive officer of the agency, or (ii) a senior executive officer having responsibility for the overall operations of a principal geographic unit of the agency (e.g., Regional Administrators of USEPA) [40 CFR §122.22(a)(3)].
3. All reports required by this Order and other information requested by the Regional Water Board, State Water Board, or USEPA shall be signed by a person described in paragraph (B.2) of this provision, or by a duly authorized representative of that person. A person is a duly authorized representative only if:
- a. The authorization is made in writing by a person described in paragraph (B.2) of this provision [40 CFR §122.22(b)(1)];
  - b. The authorization specified either an individual or a position having responsibility for the overall operation of the regulated facility or activity such as the position of plant manager, operator of a well or a well field, superintendent, position of equivalent responsibility, or an individual or position having overall responsibility for environmental matters for the company (a duly authorized representative may thus be either a named individual or any individual occupying a named position) [40 CFR §122.22(b)(2)]; and
  - c. The written authorization is submitted to the Regional Water Board, State Water Board, or USEPA [40 CFR §122.22(b)(3)].
4. If an authorization under paragraph (B.3) of this provision is no longer accurate because a different individual or position has responsibility for the overall operation of the facility, a new authorization satisfying the requirements of paragraph (B.3) of this provision must be submitted to the Regional Water Board, State Water Board

or USEPA prior to or together with any reports, information, or applications, to be signed by an authorized representative [40 CFR §122.22(c)].

5. Any person signing a document under paragraph (B.2) or (B.3) of this provision shall make the following certification:

"I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations" [40 CFR §122.22(d)].

### **C. Monitoring Reports**

1. Monitoring results shall be reported at the intervals specified in the MRP in this Order [40 CFR §122.41(l)(4)].
2. Monitoring results must be reported on a Discharge Monitoring Report (DMR) form or forms provided or specified by the Regional Water Board or State Water Board for reporting results of monitoring of sludge use or disposal practices [40 CFR §122.41(l)(4)(i)].
3. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under 40 CFR section 136 or, in the case of sludge use or disposal, approved under 40 CFR section 136 unless otherwise specified in 40 CFR section 503, or as specified in this Order, the results of this monitoring shall be included in the calculation and reporting of the data submitted in the DMR or sludge reporting form specified by the Regional Water Board [40 CFR §122.41(l)(4)(ii)].
4. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order [40 CFR §122.41(l)(4)(iii)].

### **D. Compliance Schedules**

Reports of compliance or noncompliance with, or any progress reports on, interim and final requirements contained in any compliance schedule of this Order, shall be submitted no later than 14 days following each schedule date [40 CFR §122.41(l)(5)].

### **E. Twenty-Four Hour Reporting**

1. The Discharger shall report any noncompliance that may endanger health or the environment. Any information shall be provided orally within 24 hours from the time the Discharger becomes aware of the circumstances. A written submission shall

also be provided within five (5) days of the time the Discharger becomes aware of the circumstances. The written submission shall contain a description of the noncompliance and its cause; the period of noncompliance, including exact dates and times, and if the noncompliance has not been corrected, the anticipated time it is expected to continue; and steps taken or planned to reduce, eliminate, and prevent reoccurrence of the noncompliance [40 CFR §122.41(l)(6)(i)].

2. The following shall be included as information that must be reported within 24 hours under this paragraph [40 CFR §122.41(l)(6)(ii)]:
  - a. Any unanticipated bypass that exceeds any effluent limitation in this Order [40 CFR §122.41(l)(6)(ii)(A)].
  - b. Any upset that exceeds any effluent limitation in this Order [40 CFR §122.41(l)(6)(ii)(B)].
  - c. Violation of a maximum daily discharge limitation for any of the pollutants listed in this Order to be reported within 24 hours [40 CFR §122.41(l)(6)(ii)(C)].
3. The Regional Water Board may waive the above-required written report under this provision on a case-by-case basis if an oral report has been received within 24 hours [40 CFR §122.41(l)(6)(iii)].

#### **F. Planned Changes**

The Discharger shall give notice to the Regional Water Board as soon as possible of any planned physical alterations or additions to the permitted facility. Notice is required under this provision only when [40 CFR §122.41(l)(1)]:

1. The alteration or addition to a permitted facility may meet one of the criteria for determining whether a facility is a new source in 40 CFR §122.29(b) [40 CFR §122.41(l)(1)(i)]; or
2. The alteration or addition could significantly change the nature or increase the quantity of pollutants discharged. This notification applies to pollutants which are subject neither to effluent limitations in this Order nor to notification requirements under 40 CFR section 122.42(a)(1) (see Additional Provisions—Notification Levels VII.A.1) [40 CFR §122.41(l)(1)(ii)]; or
3. The alteration or addition results in a significant change in the Discharger's sludge use or disposal practices, and such alteration, addition, or change may justify the application of permit conditions that are different from or absent in the existing permit, including notification of additional use or disposal sites not reported during the permit application process or not reported pursuant to an approved land application plan [40 CFR §122.41(l)(1)(iii)].

## **G. Anticipated Noncompliance**

The Discharger shall give advance notice to the Regional Water Board or State Water Board of any planned changes in the permitted facility or activity that may result in noncompliance with General Order requirements [40 CFR §122.41(l)(2)].

## **H. Other Noncompliance**

The Discharger shall report all instances of noncompliance not reported under Standard Provisions – Reporting E.3, E.4, and E.5 at the time monitoring reports are submitted. The reports shall contain the information listed in Standard Provision – Reporting V.E [40 CFR §122.41(l)(7)].

## **I. Discharge Monitoring Quality Assurance (DMQA) Program [STATE WATER BOARD/USEPA 106 MOA]**

The Discharger shall conduct appropriate analyses on any sample provided by USEPA as part of the DMQA program. The results of such analyses shall be submitted to USEPA's DMQA manager.

## **J. Other Information**

When the Discharger becomes aware that it failed to submit any relevant facts in a permit application, or submitted incorrect information in a permit application or in any report to the Regional Water Board, State Water Board, or USEPA, the Discharger shall promptly submit such facts or information [40 CFR §122.41(l)(8)].

# **VI. STANDARD PROVISIONS – ENFORCEMENT**

- A. NOT APPLICABLE.** The CWA provides that any person who violates section 301, 302, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any such sections in a permit issued under section 402, or any requirement imposed in a pretreatment program approved under sections 402(a)(3) or 402(b)(8) of the Act, is subject to a civil penalty not to exceed \$25,000 per day for each violation. The CWA provides that any person who negligently violates sections 301, 302, 306, 307, 308, 318, or 405 of the Act, or any condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, or any requirement imposed in a pretreatment program approved under section 402(a)(3) or 402(b)(8) of the Act, is subject to criminal penalties of \$2,500 to \$25,000 per day of violation, or imprisonment of not more than one (1) year, or both. In the case of a second or subsequent conviction for a negligent violation, a person shall be subject to criminal penalties of not more than \$50,000 per day of violation, or by imprisonment of not more than two (2) years, or both. Any person who knowingly violates such sections, or such conditions or limitations is subject to criminal penalties of \$5,000 to \$50,000 per day of violation, or imprisonment for not more than three (3) years, or both. In the case of a second or subsequent conviction for a knowing violation, a person shall be subject to criminal penalties of not more than \$100,000 per day of violation, or imprisonment of not more than six (6) years, or both. Any person

who knowingly violates section 301, 302, 303, 306, 307, 308, 318 or 405 of the Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of the Act, and who knows at that time that he thereby places another person in imminent danger of death or serious bodily injury, shall, upon conviction, be subject to a fine of not more than \$250,000 or imprisonment of not more than 15 years, or both. In the case of a second or subsequent conviction for a knowing endangerment violation, a person shall be subject to a fine of not more than \$500,000 or by imprisonment of not more than 30 years, or both. An organization, as defined in section 309(c)(3)(B)(iii) of the Clean Water Act, shall, upon conviction of violating the imminent danger provision, be subject to a fine of not more than \$1,000,000 and can be fined up to \$2,000,000 for second or subsequent convictions [40 CFR §122.41(a)(2)] [CWC 13385 and 13387].

- B. NOT APPLICABLE.** Any person may be assessed an administrative penalty by the Regional Water Board for violating section 301, 302, 306, 307, 308, 318 or 405 of this Act, or any permit condition or limitation implementing any of such sections in a permit issued under section 402 of this Act. Administrative penalties for Class I violations are not to exceed \$10,000 per violation, with the maximum amount of any Class I penalty assessed not to exceed \$25,000. Penalties for Class II violations are not to exceed \$10,000 per day for each day, during which the violation continues, with the maximum amount of any Class II penalty not to exceed \$125,000 [40 CFR §122.41(a)(3)].
- C.** The CWA provides that any person who falsifies, tampers with, or knowingly renders inaccurate any monitoring device or method required to be maintained under this permit shall, upon conviction, be punished by a fine of not more than \$10,000, or by imprisonment for not more than two years, or both. If a conviction of a person is for a violation committed after a first conviction of such person under this paragraph, punishment is a fine of not more than \$20,000 per day of violation, or by imprisonment of not more than four years, or both [40 CFR §122.41(j)(5)].
- D.** The CWA provides that any person who knowingly makes any false statement, representation, or certification in any record or other document submitted or required to be maintained under this Order, including monitoring reports or reports of compliance or noncompliance shall, upon conviction, be punished by a fine of not more than \$10,000 per violation, or by imprisonment for not more than six months per violation, or by both [40 CFR §122.41(k)(2)].

## **VII. ADDITIONAL PROVISIONS – NOTIFICATION LEVELS**

### **A. Non-Municipal Facilities**

Existing manufacturing, commercial, mining, and silvicultural Dischargers shall notify the Regional Water Board as soon as they know or have reason to believe [40 CFR §122.42(a)]:

1. That any activity has occurred or will occur that would result in the discharge, on a routine or frequent basis, of any toxic pollutant that is not limited in this Order, if

that discharge will exceed the highest of the following "notification levels" [40 CFR §122.42(a)(1)]:

- a. 100 micrograms per liter (µg/L) [40 CFR §122.42(a)(1)(i)];
  - b. 200 µg/L for acrolein and acrylonitrile; 500 µg/L for 2,4-dinitrophenol and 2-methyl-4,6-dinitrophenol; and 1 milligram per liter (mg/L) for antimony [40 CFR §122.42(a)(1)(ii)];
  - c. Five (5) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge [40 CFR §122.42(a)(1)(iii)]; or
  - d. The level established by the Regional Water Board in accordance with 40 CFR section 122.44(f) [40 CFR §122.42(a)(1)(iv)].
2. That any activity has occurred or will occur that would result in the discharge, on a non-routine or infrequent basis, of any toxic pollutant that is not limited in this Order, if that discharge will exceed the highest of the following "notification levels" [40 CFR §122.42(a)(2)]:
- a. 500 micrograms per liter (µg/L) [40 CFR §122.42(a)(2)(i)];
  - b. 1 milligram per liter (mg/L) for antimony [40 CFR §122.42(a)(2)(ii)];
  - c. Ten (10) times the maximum concentration value reported for that pollutant in the Report of Waste Discharge [40 CFR §122.42(a)(2)(iii)]; or
  - c. The level established by the Regional Water Board in accordance with 40 CFR §122.44(f) [40 CFR §122.42(a)(2)(iv)].

**B. Publicly-Owned Treatment Works (POTWs) (Not Applicable)**

## **ATTACHMENT E – MONITORING AND REPORTING PROGRAM (MRP)**

Title 40 of the Code of Federal Regulations (CFR) section 122.48 requires that all National Pollutant Discharge Elimination System (NPDES) permits specify monitoring and reporting requirements. California Water Code sections 13267 and 13383 also authorize the Regional Water Quality Control Board (Regional Water Board) to require technical and monitoring reports. This MRP establishes monitoring and reporting requirements, which implement the federal and California regulations.

### **I. GENERAL MONITORING PROVISIONS**

- A. Samples and measurements taken as required herein shall be representative of the volume and nature of the monitored discharge. All samples shall be taken at the monitoring location identified in the representative sampling and analysis program. Another waste stream, body of water, or substance shall not dilute the monitored discharge. Monitoring points shall not be changed without notification to and the approval of the appropriate Regional Water Board.
- B. Monitoring must be conducted according to USEPA test procedures approved under 40 CFR section 136, *Guidelines Establishing Test Procedures for the Analysis of Pollutants Under the Clean Water Act* as amended, unless other test procedures are specified in this Order and/or by the appropriate Regional Water Board.
- C. If the Discharger monitors any pollutant more frequently than required by this Order using test procedures approved under 40 CFR section 136, or as specified in this Order or by the appropriate Regional Water Board, the results of the monitoring shall be included in the calculation and reporting of the data submitted in the Discharger's Annual Report. The increased frequency of monitoring shall also be reported.
- D. Calculations for all limitations, which require averaging of measurements, shall utilize an arithmetic mean unless otherwise specified in this Order.
- E. All analyses shall be performed in a laboratory certified to perform such analyses by the California Department of Health Services or a laboratory approved by the appropriate Regional Water Board.
- F. All monitoring instruments and devices used by the Discharger to fulfill the monitoring program shall be properly maintained and calibrated to ensure accuracy. All flow measurement devices shall be calibrated at least once per year to ensure accuracy of the devices.

### **II. MONITORING LOCATIONS**

- A. Dischargers enrolling for the first time under this General Permit shall develop a representative sampling and analysis program to be used as case studies to represent the typical types of discharges occurring within their service areas. This

study, to be submitted as the first annual report, will include the monitoring locations and rationale for choosing those locations.

- B. Re-enrollees must submit a new case study defining monitoring locations and rationale for these locations, if there are new types of discharges.

### **III. INFLUENT MONITORING REQUIREMENTS (Not Applicable)**

### **IV. EFFLUENT MONITORING REQUIREMENTS**

- A. Dischargers who are enrolling for the first time under this General Permit shall develop a representative sampling and analysis program to be used as case studies to represent the typical types of discharges from utility vaults and underground structures. Separate case studies are required for each region. Re-enrollees are required to submit case studies only for newly identified types of discharges not previously covered in the initial case studies. The case studies will be used to provide reasonable assurance that the discharges will comply with the requirements of the General Permit. The case studies shall be completed within six months of enrollment under the General Permit, or within twelve months when no discharge occurs within the first six months. In the case studies, the Discharger shall define the types of discharges that occur and take up to five<sup>1</sup> representative samples of each type of discharge and analyze the samples using test procedures specified in 40 CFR section 136 for the following constituents:
- Total Petroleum Hydrocarbons (TPH)
    - TPH as Gasoline (TPH-g) - Report Benzene, Ethylbenzene, Toluene, and Xylene
    - TPH as Diesel (TPH-d)
  - Oil and Grease
  - pH
  - Total Suspended Solids (TSS)
- B. Samples taken shall be representative of the monitored activities and shall be performed after the implementation of the Pollution Prevention Practices (PPPs) outlined in the Pollution Prevention Plan (PLAN).
- C. The Discharger shall provide in the case studies at least the following:
1. A list of the typical types of discharges that occur in the project area.
  2. A rationale for the selection of sampling locations.
  3. A description of the sampling methods, locations, and frequency of monitoring for each type of discharge.
  4. The results of any analysis done for each type of discharge.

<sup>1</sup> If there are less than five discharges, the number samples should be equal to the number of discharges for that year. For example, if a small utility only dewater three vaults in a year, only three samples can and should be submitted in the annual report. The discharger must include an explanation of this in the annual report's cover letter.

- D. First time enrollees shall submit case studies with the first annual report, as described in Section II, which constitutes the first year's annual monitoring. Case studies for newly identified types of discharges not previously covered or submitted with the first annual report shall be submitted with the annual report for that same year.
- E. The Discharger shall provide a map showing the location of the samples taken for the case studies with respect to the distribution system. The map must also show the surface waters within the boundaries of the service area to which water may be discharged.
- F. Annually, the Discharger, using test procedures specified in 40 CFR section 136, shall analyze a representative sample for each type of discharge listed in the case studies required by Provision IV.A.1. above for the following constituents:

| Parameter                    | Units          | Sample Type | Minimum Sampling Frequency | Required Analytical Test Method |
|------------------------------|----------------|-------------|----------------------------|---------------------------------|
| TPH                          | mg/L or ug/L   | Grab        | Case Study & Annual        |                                 |
| Oil and Grease               | mg/L           | Grab        | Case Study & Annual        |                                 |
| pH                           | Standard Units | Grab        | Case Study & Annual        |                                 |
| Total Suspended Solids (TSS) | mg/L           | Grab        | Case Study & Annual        |                                 |

Laboratories analyzing monitoring samples shall be certified by the Department of Health Services, in accordance with the provision of Water Code Section 13176, and must include quality assurance/quality control data with their reports.

The results of such analysis shall be reported in the annual report. Grab samples shall be collected at the applicable point of discharge (either at the storm drain or the receiving water). If a Discharger monitors the above constituents more frequently than required by this General Permit, then the results of such monitoring shall be included in the calculation and reporting of the data submitted in the annual report. Separate annual reports are required for each region.

- G. The Discharger shall retain records of all monitoring information, including all calibration and maintenance records and all original strip chart recordings for continuous monitoring instrumentation, copies of all reports required by this Order, and records of all data used to complete the application for this Order, for a period of at least five years from the date of the sample, measurement, report, or application. This period may be extended by request of this Regional Water Board. These records shall include:
1. The date, place, and time of site inspections, sampling, visual observation, and/or measurement;
  2. The individual(s) who performed the site inspections, sampling, visual observations, and/or measurements;
  3. The dimension, size and/or volume of vault;
  4. Flow measurements (if required) and duration of discharge;

5. The estimated volume of discharge;
6. The date and time of analyses;
7. The laboratory, staff, or wholesaler who performed the analyses;
8. Analytical results.

**V. WHOLE EFFLUENT TOXICITY TESTING REQUIREMENTS (Not Applicable)**

**VI. LAND DISCHARGE MONITORING REQUIREMENTS (Not Applicable)**

**VII. RECLAMATION MONITORING REQUIREMENTS (Not Applicable)**

**VIII. RECEIVING WATER MONITORING REQUIREMENTS – SURFACE WATER AND GROUNDWATER (Not Applicable)**

**IX. OTHER MONITORING REQUIREMENTS (Not Applicable)**

**X. REPORTING REQUIREMENTS**

**A. General Monitoring and Reporting Requirements**

The Discharger will submit the case studies as the first annual report. All reports submitted in response to this General Permit shall comply with signatory requirements set forth in V.B.2 in Attachment D. All reports shall be submitted to the appropriate Regional Water Board Executive Officer.

**B. Self Monitoring Reports (SMRs)**

1. At any time during the term of this permit, the State or Regional Water Board may notify the Discharger to electronically submit Self-Monitoring Reports (SMRs) using the State Water Board's California Integrated Water Quality System (CIWQS) Program Web site (<http://www.waterboards.ca.gov/ciwqs/index.html>). Until such notification is given, the Discharger shall submit hard copy SMRs. The CIWQS Web site will provide additional directions for SMR submittal in the event there will be service interruption for electronic submittal.
2. The Discharger shall submit annual monitoring results to the Regional Water Board by the **20th day of March** for the preceding calendar year. The Discharger shall report in the SMR the results for all monitoring specified in this MRP under sections VI through IX. Additionally, the Discharger shall report in the SMR the results of any **PPP and PLAN** required by Special Provisions – VI.C.3 of this Order. The Discharger shall submit **annual** SMRs including the results of all required monitoring using USEPA-approved test methods or other test methods specified in this Order. If the Discharger monitors any pollutant more frequently than required by this Order, the results of this monitoring shall be included in the calculations and reporting of the data submitted in the SMR.
3. The Discharger shall submit SMRs in accordance with the following requirements:

- a. The Discharger shall arrange all reported data in a tabular format. The data shall be summarized to clearly illustrate whether the facility is operating in compliance with interim and/or final effluent limitations. The Discharger is not required to duplicate the submittal of data that are entered in a tabular format within CIWQS. When electronic submittal of data is required and CIWQS does not provide for entry into a tabular format within the system, the Discharger shall electronically submit the data in a tabular format as an attachment.
- b. The Discharger shall attach a cover letter to the SMR. The information contained in the cover letter shall clearly identify violations of this Order; discuss corrective actions taken or planned; and the proposed time schedule for corrective actions. Identified violations must include a description of the requirement that was violated and a description of the violation.
- c. SMRs must be submitted to the appropriate Regional Water Board, signed and certified as required by the Standard Provisions (Attachment D).

#### **C. Discharge Monitoring Reports (DMRs)**

When requested by USEPA, the Discharger shall also complete and submit Discharge Monitoring Reports to USEPA. The submittal date shall be specified in the request.

#### **D. Other Reports (Not Applicable)**

## ATTACHMENT F – FACT SHEET

As described in section III of this Order, this Fact Sheet includes the legal requirements and technical rationale that serve as the basis for the requirements of this Order.

### I. PERMIT INFORMATION

- A. **Background.** In 1972, the Federal Water Pollution Control Act, currently referred to as the Federal Clean Water Act (CWA), was amended to provide that the discharge of pollutants to waters of the United States from any point source is prohibited, unless the discharge is in compliance with a National Pollutant Discharge Elimination System (NPDES) permit. The federal regulations allow authorized states to issue either general permits or individual permits to regulate discharges of pollutants to waters of the United States. On August 15, 1996, the State Water Resources Control Board (State Water Board) issued a General Permit for discharges from utility vaults and underground structures to surface waters. The permit was reissued on July 19, 2001.

In accordance with Title 40, Code of Federal Regulations (CFR), the State Water Board must meet general program requirements prior to the re-issuance and adoption of a general NPDES permit. General program requirements include preparing a draft General Permit, public noticing, allowing a public comment period, and conducting a public hearing. To meet these requirements, the State Water Board prepared a draft General Permit. The draft General Permit was sent to interested parties on May 9, 2006 for comments. A public hearing to receive testimony from interested parties was scheduled for July 19, 2006. The Notice of Public Hearing was sent to the interested party list at the same time the draft General Permit was sent. A public hearing notice was also posted in major newspapers throughout the State of California on May 9, 2006.

This General Permit reissues the 2001 permit Order No. 2001-11-DWQ. Since the original permit was adopted in 1996, the United States Environmental Protection Agency (USEPA) promulgated the California Toxics Rule (CTR) in May 2000. The CTR, which is codified in 40 CFR section 131.38, establishes numeric criteria for priority toxic pollutants for California. The CTR and National Toxics Rule (NTR) criteria and water quality objectives for priority pollutants in state-adopted water quality control plans (Basin Plans), together with designated beneficial uses in those plans, serve as priority pollutant standards for the state. Concurrently with the CTR adoption, the State Water Board adopted a *Policy for Implementation of Toxics Standards for Inland Surface Waters, Enclosed Bays, and Estuaries of California* (SIP).

- B. **General Criteria.** This General Permit is intended to cover short-term intermittent discharges of pollutants to surface waters from utility vaults and underground structures. To be covered by this General Permit, discharges must meet the following criteria:
1. Pollutant concentrations in the discharge do not cause, have a reasonable potential to cause, or contribute to an exceedance of any applicable criterion

established by the USEPA pursuant to CWA section 303. Likewise, pollutant concentrations in the discharge do not cause, have a reasonable potential to cause, or contribute to an exceedance of any water quality objective adopted by the State or Regional Water Board including prohibitions of discharge for the receiving water.

The discharge does not cause acute or chronic toxicity in the receiving water.

This General Permit does **not** cover:

1. Discharges from vehicle and equipment washing, vehicle maintenance, and/or groundwater cleanup activities by utility companies.
2. Utility service construction activities by utility companies engaged in developing service areas. These activities may be covered under the statewide general NPDES permit for storm water discharges associated with construction activities (CAS000002) and/or CWA section 401 certifications.
3. Discharges by utility companies that are Dischargers and/or co-Dischargers under Urban Areawide Storm Water Permits, which cover the intended discharges.
4. Discharges to a sanitary sewer. These discharges do not need regulatory coverage under the NPDES Program, although the agency controlling the sanitary sewer must approve discharges to its conveyance system.

## **II. NOTIFICATION REQUIREMENTS**

The purpose of this General Permit is to facilitate regulation of discharges from the dewatering of utility vaults and underground structures. To obtain coverage under this General Permit, the Discharger must submit a Notice of Intent (NOI), a project map(s), a Pollution Prevention Plan (PLAN), and first annual fee. Discharges in more than one Regional Water Quality Control Board (Regional Water Board) boundary must be covered by a separate enrollment under this General Permit. Each enrollment will cover all discharges occurring within the boundaries of that Regional Water Board. Signing the certification on the NOI signifies that the Discharger intends to comply with the provisions of this General Permit. An NOI must be signed to be valid.

## **III. DISCHARGE DESCRIPTION**

Vaults are used to house meters, filters, pressure regulators, and valves with or without actuators. Structures can be either wet or dry. Wet structures include manholes and hand holes containing cables, cable connections, and signal enhancers. Dry structures are sealed more tightly and are usually air conditioned since these contain switchgears, computers, and electronics that are sensitive to heat and moisture.

For safety reasons, utility companies must de-water vaults and underground structures prior to performing any repair, maintenance, and/or installation of equipment. When the amount of water in the vaults or structures interferes with the safety and quality of the work to be done, water must be pumped out. Volume of discharges can vary from a few gallons to a few thousand gallons depending on the configuration and individual situation at each vault or structure. The duration of the discharges could last a few minutes to a few hours depending on the amount of water present in the vaults and underground structures and the pump used. Typical pump rates are five gallons per minute (gpm) to 20 gpm but could be as high as 60 gpm.

**A. Description of Wastewater and Biosolids Treatment or Controls (Not Applicable)**

**B. Discharge Points and Receiving Waters**

Under the General Permit, there may be multiple discharge points. Information regarding the receiving waters can be found in the completed NOI.

**C. Summary of Existing Requirements and Self-Monitoring Report Data**

Order No. 2001-11-DWQ, which this General Permit replaces, also required the development of Pollution Prevention Practices (PPPs) and a PLAN. The significant change is in the Monitoring and Reporting Program (MRP) requirements. The 2001 Order required the monitoring of total petroleum hydrocarbons (TPH), but did not specify between diesel and gasoline. It also did not explicitly state that monitoring was required in every region for those Dischargers operating in more than one region. It was implied by the term “representative,” but not stated directly. On February 28, 2005, in *Waterkeeper Alliance Inc., et al. v. EPA*, the 2<sup>nd</sup> Circuit Court of Appeals determined that nutrient management plans must be submitted as part of the NPDES permit application and subject to review and approval. The changes to the PLAN requirements in this permit reflect this Court Decision.

**D. Compliance Summary (Not Applicable)**

**E. Planned Changes (Not Applicable)**

**IV. APPLICABLE PLANS, POLICIES, AND REGULATIONS**

The requirements contained in the proposed Order are based on the requirements and authorities described in this section.

**A. Legal Authorities**

This Order is issued pursuant to section 402 of the CWA and implementing regulations adopted by the USEPA and Chapter 5.5, Division 7 of the California Water Code (CWC). It shall serve as an NPDES permit for point source discharges from utility vaults and underground structures to surface waters. This Order also serves as

Waste Discharge Requirements (WDRs) pursuant to Article 4, Chapter 4 of the CWC for discharges that are not subject to regulation under CWA section 402.

States may request authority to issue general NPDES permits pursuant to 40 CFR section 122.28. On June 8, 1989, the State Water Board submitted an application to the USEPA requesting revisions to its NPDES Program in accordance with 40 CFR 122.28, 123.62, and 403.10. The application included a request to add general permit authority to its approved NPDES Program. On September 22, 1989, the USEPA, Region 9, approved the State Water Board's request and granted authorization for the State to issue general NPDES permits.

## **B. California Environmental Quality Act (CEQA)**

This action to adopt an NPDES permit is exempt from the provisions of the CEQA (Public Resources Code section 21100, et seq.) in accordance with section 13389 of the CWC.

State Water Board action on case-by-case exceptions is subject to the California Environmental Quality Act (CEQA). Because a Discharger cannot obtain coverage under this General Permit if pollutants in the discharge, cause, contribute, or have the reasonable potential to cause or contribute to a water quality standards violation and the permit requires Dischargers to implement PPPs to ensure the Dischargers will not cause a violation, the State Water Board's granting of the exceptions does not have the potential for causing significant adverse environmental effects. This General Permit is, therefore, exempt from CEQA. See California Code of Regulations, Title 14, section 15061(b)(3).

## **C. State and Federal Regulations, Policies, and Plans**

- 1. Water Quality Control Plans.** The Regional Water Boards have adopted a Water Quality Control Plans (hereinafter Basin Plans) that designate beneficial uses, establish water quality objectives, and contain implementation programs and policies to achieve those objectives for all waters addressed through the plans. In addition, State Water Board Resolution No. 88-63 requires that, with certain exceptions, the Regional Water Boards assign the municipal and domestic supply use to water bodies that do not have beneficial uses listed in the Basin Plans. The limitations set forth in this General Permit shall apply as is unless there are more stringent provisions expressed in the Regional Water Boards' Basin Plans.
- 2. National Toxics Rule (NTR) and California Toxics Rule (CTR).** USEPA adopted the NTR on December 22, 1992, which was amended on May 4, 1995 and November 9, 1999, and the CTR on May 18, 2000, which was amended on February 13, 2001. These rules include water quality criteria for priority pollutants and are applicable to this discharge.
- 3. State Implementation Policy.** On March 2, 2000, the State Water Board adopted the SIP, which became effective on April 28, 2000, with respect to the priority pollutant criteria promulgated for California by the USEPA through the NTR and to the priority pollutant objectives established by the Regional Water Boards in their

basin plans, with the exception of the provision on alternate test procedures for individual discharges that have been approved by USEPA Regional Administrator. The alternate test procedures provision was effective on May 22, 2000. The SIP became effective on May 18, 2000 with respect to the priority pollutant criteria promulgated by the USEPA through the CTR. The State Water Board adopted amendments to the SIP on February 24, 2005 that became effective on July 13, 2005. The SIP includes procedures for determining the need for and calculating Water Quality-Based Effluent Limitations (WQBELs), and requires Dischargers to submit data sufficient to do so. In this permit the State Water Board grants an exception from sections 1.3 (Determination of Priority Pollutants Requiring WQBELs) and 1.4 (Calculations of Effluent Limitations) of the SIP because numeric effluent limitations are infeasible for discharges from utility vaults and underground structures. Granting an exception will not compromise protection of inland surface water, bay, or estuarine beneficial uses and will serve the public interest because:

- a. A Discharger cannot be covered under this General Permit if the discharge can cause or contribute to a violation of any applicable water quality standard, including priority pollutant standards.
- b. All Dischargers covered under this General Permit must implement a PLAN to ensure compliance with all applicable water quality standards, including standards for priority pollutants.

The SIP establishes procedures for selecting priority pollutants requiring WQBELs and for calculating the limits. The SIP also authorizes case-by-case exceptions if the State Water Board determines that (1) the exceptions will not compromise protection of surface water beneficial uses, and (2) the public interest will be served. This proposed revision of the General Permit approves case-by-case exceptions from the SIP provisions on the selection of priority pollutants requiring limits (section 1.3) and the calculation of numeric limitations (section 1.4). The permit proposes these exceptions because numeric effluent limitations for discharges from utility vaults and underground structures to surface waters are infeasible.

This General Permit meets the conditions for case-by-case exceptions from the SIP provisions on selection of pollutants requiring WQBELs and calculation of numeric limits. Although the permit does not contain numeric effluent limitations for toxic pollutants, granting the exceptions will not compromise the protection of surface water beneficial uses for several reasons. First, no Discharger can obtain coverage under the permit if pollutants in the discharge have the reasonable potential to cause or contribute to a water quality standards violation. Second, the permit requires Dischargers to implement pollutant prevention practices to ensure that the discharges will not cause a water quality standards violation.

Because the conditions of the case-by-case exception have been met, the State Water Board will continue to grant an exception based on the following:

- a. A Discharger cannot obtain coverage under this General Permit if pollutants in the -discharge have the reasonable potential to cause or contribute to a water quality standards violation.
  - b. This General Permit requires Dischargers to implement PPPs to ensure that discharges will not cause a violation of any applicable objectives (or criteria) in the receiving waters.
  - c. Discharges from utility vaults and underground structures to surface waters will not have the potential to cause significant adverse environmental effects provided the conditions of the newly adopted General Permit are met.
4. **Antidegradation Policy.** Section 131.12 of 40 CFR requires that State water quality standards include an antidegradation policy consistent with the federal policy. The State Water Board established California's antidegradation policy in State Water Board Resolution No. 68-16, which incorporates the requirements of the federal antidegradation policy where applicable. Resolution No. 68-16 requires that existing water quality be maintained unless degradation is justified based on specific findings. As discussed in detail in this Fact Sheet, the permitted discharge is consistent with the antidegradation provision of 40 CFR section 131.12 and State Water Board Resolution No. 68-16.
5. **Anti-Backsliding Requirements.** Sections 402(o)(2) and 303(d)(4) of the CWA and 40 CFR section 122.44(l) prohibit backsliding in NPDES permits. These anti-backsliding provisions require that effluent limitations in a reissued permit must be as stringent as those in the previous permit, with some exceptions in which limitations may be relaxed. **All effluent limitations in the Order are at least as stringent as the effluent limitations in the previous Order.**
6. **Monitoring and Reporting Requirements.** Section 122.48 of 40 CFR requires that all NPDES permits specify requirements for recording and reporting monitoring results. Sections 13267 and 13383 of the CWC authorize the Regional Water Boards to require technical and monitoring reports. The MRP establishes monitoring and reporting requirements to implement Federal and State requirements. This MRP is provided in Attachment E.

#### **D. Impaired Water Bodies on CWA 303(d) List (Not Applicable)**

#### **E. Other Plans, Policies and Regulations (Not Applicable)**

### **V. RATIONALE FOR EFFLUENT LIMITATIONS AND DISCHARGE SPECIFICATIONS**

The CWA requires point source Dischargers to control the amount of conventional, non-conventional, and toxic pollutants that are discharged into the waters of the United States. The control of pollutants discharged is established through effluent limitations and other requirements in NPDES permits. There are two principal bases for effluent limitations: 40 CFR section 122.44(a) requires that permits include applicable technology-based limitations and standards; and 40 CFR section 122.44(d) requires that permits include

water quality-based effluent limitations to attain and maintain applicable numeric and narrative water quality criteria to protect the beneficial uses of the receiving water. Where numeric water quality criteria have not been established, three options exist to protect water quality: 1) 40 CFR section 122.44(d) specifies that WQBELs may be established using USEPA criteria guidance under CWA section 304(a); 2) proposed state criteria or a state policy interpreting narrative criteria supplemented with other relevant information may be used; or 3) an indicator parameter may be established.

## **A. Discharge Prohibitions**

Discharges under this Order are required to be nontoxic. Toxicity is the adverse response of organisms to chemicals or physical agents. This prohibition is based on the Regional Water Boards' Basin Plans, which require that all waters be maintained free of toxic substances in concentrations that are lethal or produce other detrimental responses in aquatic organisms. Detrimental responses include, but are not limited to, decreased growth rate and decreased reproductive success of resident or indicator species. Basin Plans also require waters to be free of toxic substances in concentrations that produce detrimental physiological responses in human, plant, or animal life. This objective applies regardless of whether the toxicity is caused by a single substance or the interactive effect of multiple substances.

## **B. Technology-Based Effluent Limitations (TBELs)**

### **1. Scope and Authority**

The CWA requires that TBELs be established based on several levels of controls:

- A. Best Practicable Treatment Control Technology (BPT) represents the average of the best performance by plants within an industrial category or subcategory. BPT standards apply to toxic, conventional, and nonconventional pollutants.
- B. Best Available Technology Economically Achievable (BAT) represents the best existing performance of treatment technologies that are economically achievable within an industrial point source category. BAT standards apply to toxic and nonconventional pollutants.
- C. Best Conventional Pollutant Control Technology (BCT) represents the control from existing industrial point sources of conventional pollutants including BOD, TSS, fecal coliform, pH, and oil and grease. The BCT standard is established after considering the "cost reasonableness" of the relationship between the cost of attaining a reduction in effluent discharge and the benefits that would result, and also the cost effectiveness of additional industrial treatment beyond BPT.
- D. New Source Performance Standards (NSPS) represent the best available demonstrated control technology standards. The intent of NSPS guidelines is to set limitations that represent state-of-the-art treatment technology for new sources.

The CWA requires USEPA to develop Effluent Limitations, Guidelines and Standards (ELGs) representing application of BPT, BAT, BCT, and NSPS. Section 402(a)(1) of the CWA and 40 CFR section 125.3 of the NPDES regulations authorize the use of Best Professional Judgment (BPJ) to derive technology-based effluent limitations on a case-by-case basis where ELGs are not available for certain industrial categories and/or pollutants of concern. Where BPJ is used, the permit writer must consider specific factors outlined in 40 CFR section 125.3.

## **2. Applicable Technology-Based Effluent Limitations**

It is not feasible to establish numeric effluent limitations for pollutants in discharges from utility vaults and underground structures. Instead, the provisions of this General Permit require implementation of Pollution Prevention Practices (PPPs) to control and abate the discharge of pollutants to surface waters and to achieve compliance utilizing BAT and BCT requirements and with applicable water quality standards.

## **C. Water Quality-Based Effluent Limitations (WQBELs)**

### **1. Scope and Authority**

As specified in 40 CFR section 122.44(d)(1)(i), permits are required to include WQBELs for pollutants (including toxicity) that are or may be discharged at levels that cause, have reasonable potential to cause, or contribute to an excursion above any state water quality standard. The process for determining reasonable potential and calculating WQBELs when necessary is intended to protect the designated uses of the receiving water as specified in the Basin Plan, achieve applicable water quality objectives and criteria contained in state plans and policies, and meet water quality criteria in the CTR and NTR.

### **2. Applicable Beneficial Uses and Water Quality Criteria and Objectives**

The designated beneficial uses of surface waters throughout the State may include municipal, domestic, industrial, and agricultural supply; water contact and non-contact recreation; navigation; groundwater recharge and freshwater replenishment; hydropower generation; wildlife habitat; cold freshwater and warm freshwater habitat; fish migration and fish spawning; marine habitat; estuarine habitat; shellfish harvesting; ocean commercial and sport fishing; areas of special biological significance; and preservation of rare and endangered species. To the extent that the applicable Basin Plan designates additional or different beneficial uses, the Basin Plan shall control.

### **3. Determining the Need for WQBELs**

NPDES permits for discharges to surface waters must meet all applicable provisions of sections 301 and 402 of the CWA. These provisions require controls of pollutant discharges that utilize BAT and BCT to reduce pollutant and any more stringent controls necessary to meet water quality standards.

Utility companies may have multiple discharges from utility vaults and other underground structures as a result of storm water inflow, subterranean seepage, and/or water condensation from the air conditioning units of dry structures. These vaults and underground structures may have small quantities of oil and grease present due to the normal operation of equipment, as well as small quantities of other pollutants. Establishment of numeric effluent limitations for pollutants from utility vaults and underground structures is not feasible because: (1) utility companies have numerous short duration intermittent releases of water to surface waters from many different locations, and (2) treatment of all these releases to meet numeric effluent limitations would be impractical.

Therefore, the effluent limitations contained in this General Permit are narrative and include the requirement to implement appropriate PPPs, which are equivalent to Best Management Practices (BMPs). Section 122.44(k)(3) of 40 CFR allows the use of BMPs to control or abate the discharge of pollutants when “Numeric effluent limitations are infeasible; or (4) the practices are reasonably necessary to achieve effluent limitations and standards or to carry out the purposes and intent of the CWA.” It is not feasible to establish WQBELs for pollutants in discharges from utility vaults or underground structures; therefore, in lieu of WQBELs, this Order requires Dischargers to establish PPPs in PLANS.

The PPPs, which may include treatment of discharges to surface waters, will constitute BAT and BCT and are required to achieve compliance with water quality standards. Receiving water requirements must be met by the Discharger and are stated as either numerical or narrative requirements, as appropriate. They are intended to cover all applicable Basin Plan objectives, including narrative toxicity objectives, total residual chlorine objectives (if applicable), and all applicable federal criteria, including CTR and NTR criteria.

**4. WQBEL Calculations (Not Applicable)**

**5. Whole Effluent Toxicity (WET) (Not Applicable)**

**D. Final Effluent Limitations (Not Applicable)**

**E. Interim Effluent Limitations (Not Applicable)**

**F. Land Discharge Specifications (Not Applicable)**

**G. Reclamation Specifications (Not Applicable)**

**VI. RATIONALE FOR RECEIVING WATER LIMITATIONS**

**A. Surface Water**

Receiving Water Limitations are based upon water quality objectives contained in appropriate Regional Water Board Basin Plans, statewide Water Quality Control Plan, or criteria promulgated by USEPA pursuant to CWA section 303.

**B. Groundwater (Not Applicable)**

**VII. RATIONALE FOR MONITORING AND REPORTING REQUIREMENTS**

Section 122.48 of 40 CFR requires all NPDES permits to specify recording and reporting of monitoring results. Sections 13267 and 13383 of the CWC authorize the Water Boards to require technical and monitoring reports. The MRP, Attachment E of this Order, establishes monitoring and reporting requirements to implement federal and state requirements. The following provides the rationale for the monitoring and reporting requirements contained in the MRP for utility vault and underground structure discharges.

**A. Influent Monitoring (Not applicable)**

**B. Effluent Monitoring**

In reviewing the monitoring reports, the State Water Board found that although Dischargers were reporting TPH, a distinction between diesel and gasoline was not always made. TPH should be reported as a total and as TPH diesel and TPH gasoline (TPH-g). Also, for detections of TPH-g, the amount of benzene, ethylbenzene, toluene, and xylene should be reported. Benzene, ethylbenzene, and toluene are priority pollutants per 40 CFR section 131.

**C. Whole Effluent Toxicity Testing Requirements (Not Applicable)**

A Whole Effluent Toxicity (WET) Limit is required if a discharge causes, has a reasonable potential to cause, or contributes to an exceedance of applicable water quality standards, including numeric and narrative. Since these types of discharges are prohibited under this General Permit, WET limits are not applicable.

**D. Receiving Water Monitoring (Not Applicable)**

**E. Other Monitoring Requirements (Not Applicable)**

**VIII. RATIONALE FOR PROVISIONS**

**A. Standard Provisions**

Standard Provisions, which in accordance with 40 CFR sections 122.41 and 122.42, apply to all NPDES discharges and must be included in every NPDES permit, are provided in Attachment D.

**B. Special Provisions**

**1. Reopener Provisions (Not Applicable)**

**2. Special Studies and Additional Monitoring Requirements (Not Applicable)**

### **3. Best Management Practices and Pollution Prevention Plan (PLAN)**

The development of PPPs provides the flexibility necessary to establish controls, which can appropriately address the different situations in which utility companies discharge water to surface waters. The PPPs have two major objectives:

- a. To identify situations which allow water to collect in the vault or underground structure and lead to a discharge.
- b. To describe and ensure the implementation of practices that will reduce pollutants in the discharge from the normal operations of utility companies.

At this time, standard industrywide PPPs have not been developed for utility companies. The Discharger must prepare a PLAN and implement it whenever there is a discharge. If standard industrywide PPPs are developed, then each utility company may utilize those standard PPPs or develop a PLAN utilizing selected standard PPPs as appropriate. PLANs must meet the specifications described in section VI.C.3. For help in developing a PLAN, refer to the following document: *California Stormwater BMP Handbook - Industrial/Commercial (January 2003 Edition)*, published by the California Stormwater Quality Association. It is available online at: <http://www.cabmphandbooks.com> and provides references the Discharger may find useful.

Dischargers must show that no feasible alternatives to surface water discharge exist and that measures have been or will be employed to minimize potential impacts. Based on the authority contained in section 304(e) of the CWA and the regulations set forth in 40 CFR 122.44(k), the states may incorporate PPPs, which are equivalent to BMPs, into NPDES permits.

### **4. Compliance Schedules (Not Applicable)**

### **5. Construction, Operation, and Maintenance Specifications (Not Applicable)**

### **6. Special Provisions for Municipal Facilities (POTWs Only) (Not Applicable)**

### **7. Other Special Provisions**

- a. Although this is a State Water Board permit, the Regional Water Boards are responsible for reviewing monitoring reports, reviewing and approving Discharger's PLANs, conducting compliance inspections, and taking enforcement actions in order to maintain water quality control in waters of their region.
- b. Dispose of solids removed from liquid wastes in a manner that is consistent with Title 27, of the California Code of Regulations and approved by the appropriate Regional Water Board's Executive Office.

## **IX. PUBLIC PARTICIPATION**

In considering the re-issuance and adoption of the General Permit for utility vaults and underground structures, the State Water Board staff has developed a draft General Permit. The State Water Board encouraged public participation in the WDR adoption process.

### **A. Notification of Interested Parties**

The State Water Board notified interested agencies and persons of its intent to prescribe waste discharge requirements in this General Permit and provided them with an opportunity to submit their written comments and recommendations. On May 9, 2006 notification was provided on the State Water Board webpage and in the following newspapers: Santa Rosa Press Democrat, San Francisco Daily Journal, San Luis Obispo Tribune, Los Angeles Daily Journal, Sacramento Daily Recorder, Victorville Daily Press, Palm Springs Desert Sun, and San Diego Daily Transcript. On May 9, 2006, the State Water Board sent out notification through a Lyris electronic mail list and by U.S. Post.

### **B. Written Comments**

The staff determinations were tentative. Interested persons were invited to submit written comments concerning this tentative General Permit. Comments were to be submitted either in person, or by fax, email, or mail to the Executive Office at the State Water Board at the address on the cover page of this permit.

To be fully addressed by staff and considered by the State Water Board, written comments must have been received at the State Water Board office by 5:00 p.m. on **June 9, 2006**.

### **C. Public Hearing**

The State Water Board held a public hearing on the tentative General Permit during its regular Board meeting on the following date and time and at the following location:

Date: **July 19, 2006**  
Time: **10 a.m.**  
Location: **Coastal Hearing Room Joe Serna Jr./CAL/EPA Building**  
**1001 I Street, 2<sup>nd</sup> Floor**  
**Sacramento, CA 95814**

Interested persons were invited to attend. At the public hearing, the State Water Board heard testimony pertinent to the discharge and General Permit. Oral testimony was heard.

#### **D. Information and Copying**

Order-related documents, tentative effluent limitations and special provisions, comments received, and other information are on file and may be inspected at the address above at any time between 8:30 a.m. and 4:45 p.m., Monday through Friday. Copying of documents may be arranged through the State Water Board by calling (916) 341-5455.

#### **E. Register of Interested Persons**

Any person interested in being placed on the mailing list for information regarding the General Permit was invited to contact the State Water Board, reference this General Permit, and provide a name, address, and phone number.

#### **F. Additional Information**

Requests for additional information or questions regarding this General Permit were directed to **Erin Mustain** at **(916) 445-9379**.

This General Permit will expire on July 19, 2011. Enrollees covered under this General Permit at the time of expiration will automatically be re-enrolled under the reissued permit, until the effective date of this permit, unless a Notice of Termination or Transfer (NOTT) is submitted to terminate coverage.

## Appendix E: Defined Terms

---

This Page Intentionally Left Blank.

## E.1 Defined Terms

### Biochemical Oxygen Demand (BOD)

BOD refers to the oxygen used in meeting the metabolic needs of aerobic microorganisms in water containing organic matter. The higher the level of organic matter, the higher the BOD. For example, water polluted with sewage would have a high BOD.

### 303(d) List

The 303(d) list is a list of water bodies that have one or more beneficial uses that are impaired by one or more pollutants. Creation and maintenance of the list is required by Section 303(d) of the CWA. The State must take appropriate action to improve impaired water bodies, for example through the development of a TMDL.

### Basin Plan

A Basin Plan is a water quality control plan developed by each Regional Board to identify designated beneficial uses and water quality objectives for the water bodies and watershed areas within that specific region.

### Beneficial Uses

Streams, lakes, rivers, and other water bodies, have uses to humans and other life; these uses are referred to as the beneficial uses of a water body. The beneficial uses of waters in California are described in the Basin Plans adopted by the nine California Regional Boards. Section 13240 of the California Water Code requires adoption of water quality control plans, called Basin Plans, for the protection of water quality within the State's watersheds. Discharges from stormwater drainage systems may convey pollutants to waters of the State, and therefore may have an adverse impact on the beneficial uses of that water resource. Beneficial uses fall into one or more of the following categories:

- Agricultural Supply (AGR) – water used for irrigation, leaching of salts, stock watering, etc.;
- Industrial Service Supply (IND) – use of water for industrial activities that do not depend primarily on water quality;
- Industrial Process Supply (PRO) – uses of water that depend primarily on water quality;
- Groundwater Recharge (GWR) – replenishment of groundwater by percolation from surface waters;
- Municipal and Domestic Supply (MUN) – water supply systems including drinking water supply;
- Freshwater Replenishment (FRSH) – maintenance of surface water quality or quantity;
- Cold Freshwater Habitat (COLD) – maintenance of cold water ecosystems;
- Warm Freshwater Habitat (WARM) – maintenance of warm water ecosystems;
- Estuarine Habitat (EST) – habitat resulting from commingling of freshwater and saltwater;
- Wildlife Habitat – (WILD) water used to support terrestrial or aquatic ecosystems;
- Preservation of Biological Habitats of Special Significance (BIOL) – water used to support designated areas such as refuges, parks or sanctuaries;
- Spawning, Reproduction, and/or Early Development (SPWN) - water used to support aquatic habitats suitable for reproduction and early development of fish;
- Migration of Aquatic Organisms (MIGR) – water used to support migration or other temporary aquatic organism uses;
- Rare, Threatened, or Endangered Species (RARE) – water used to support aquatic habitats necessary for the survival and maintenance of rare, threatened or endangered species;

- Aquaculture (AQUA) – using water for the propagation, cultivation, maintenance, or harvesting of aquatic plants or animals;
- Shellfish Harvesting (SHELL) – water used to support habitats for the maintenance of filter feeding shellfish;
- Commercial and Sport Fishing (COMM) – collecting fish for commercial or recreational purposes;
- Hydropower Generation (POW) – water used to produce electricity;
- Navigation (NAV) – the use of water for shipping or travel;
- Water Contact Recreation (REC-1) – recreational activities involving body contact with water; and
- Non-Contact Water Recreation (REC-2) – recreational activities involving proximity to water, but generally no body contact or ingestion of water.

### Best Available Technology (BAT)

BAT is a term derived from Section 301(b) of the CWA and refers to BMPs to reduce toxic and non-conventional pollutants in discharges from construction sites. Toxic pollutants are those defined in Section 307 (a)(1) of the CWA and include heavy metals and manmade organics. Non-conventional pollutants are those not covered by conventional and toxic pollutants, such as ammonia, chloride, toxicity and nitrogen.

### Best Conventional Technology (BCT)

BCT is a term derived from Section 301(b) of the federal CWA and refers to BMPs to reduce conventional pollutants in discharges from construction sites. Conventional pollutants include TSS, oil and grease, fecal coliforms, pH and other pollutants.

### Best Management Practice (BMP)

A BMP is a measure that is implemented to protect water quality and reduce potential for pollution associated with stormwater runoff. Any program, technology, process, siting criteria, operating method, or device that controls, prevents, removes, or reduces pollution. There are four categories of BMPs: Maintenance, Design Pollution Prevention, Construction Site, and Treatment:

#### Maintenance

Maintenance BMPs are water quality controls used to reduce pollutant discharges during highway maintenance activities and activities conducted at maintenance facilities. These BMPs are technology-based controls that attain MEP pollutant control. This category of BMPs includes litter pickup, toxics control, street sweeping, etc.

#### Design Pollution Prevention

Design Pollution Prevention BMPs are permanent water quality controls used to reduce pollutant discharges by preventing erosion. These BMPs are standard technology-based, non-treatment controls selected to reduce pollutant discharges to the MEP requirements. They are applicable to all projects. This category of BMPs includes preservation of existing vegetation; concentrated flow conveyance systems, such as ditches, berms, dikes, swales, overside drains, outlet protection/velocity dissipation devices; and slope/surface protection systems such as vegetated surfaces and hard surfaces.

#### Construction Site

Construction site BMPs are temporary controls used to reduce pollutant discharges during construction. These controls are best conventional technology/best available technology BCT/BAT based BMPs that may include soil stabilization, sediment control, wind erosion control, tracking control, non-stormwater management and waste management.

## Treatment

Treatment BMPs are permanent water quality controls used to remove pollutants from stormwater runoff prior to being discharged from Caltrans right-of-way. These controls are used to meet MEP requirements and are considered for projects discharging directly or indirectly to receiving waters. This category of BMPs includes: Traction Sand Traps, Infiltration Devices, Detention Devices, Biofiltration Systems, Dry Weather Flow Diversion, Media Filters, Multi-Chamber Treatment Trains, Wet Basins and GSRDs.

### California Environmental Quality Act (CEQA)

The CEQA of 1970 requires public agencies to prevent significant, avoidable damage to the environment by regulating activities that may affect the quality of the environment. Public agencies accomplish this by requiring projects to consider the use of alternatives or mitigation measures. Regulations for the implementation of CEQA are found in the CEQA Guidelines and are available online by the California Resources Agency at <http://ceres.ca.gov/ceqa>.

### Caltrans Permit

Caltrans Permit refers to the NPDES Statewide Storm Water Permit issued to Caltrans in 2012 (Order No. 2012-0011-DWQ) (CAS000003), to regulate stormwater discharges from Caltrans facilities. The Caltrans Permit does not regulate construction activities.xci The Caltrans Permit only “impose[s] electronic filing, notification, reporting and contractor requirements for certain construction projects, and imposes limitations on types of materials that may be used during construction which may have an impact on post-construction discharges.”xcii

### Clean Water Act (CWA)

The CWA, originally enacted by Congress in 1972, is a federal law that requires states to protect, restore, and maintain the quality of the waters of the United States, including lakes, rivers, aquifers and coastal areas. The CWA, as amended in 1987, is the enabling legislation for the NPDES permitting process.

### Code of Federal Regulations (CFR)

The CFR is a document that codifies all rules of the executive departments and agencies of the federal government. It is divided into 50 volumes, known as titles. Title 40 of the CFR (referenced as 40 CFR) contains federal environmental regulations. 40 CFR is available from bookstores operated by the Government Printing Office and online at: <http://www.epa.gov/epahome/cfr40.htm>.

### Construction General Permit

The General Permit is a Statewide General Permit for construction activities (Order No. 2009-00009-DWQ) (CAS000002) that applies to all stormwater discharges from activities that result in a DSA of at least one acre or more. Construction activity that results in a DSA of less than one acre is may be subject to the Construction General Permit if there is the potential for significant water quality impairment resulting from the construction activity as determined by the Regional Board.

### Construction Site

The term “construction site” applies to all areas both within the construction limits on state right-of-way and areas that are directly related to the construction activity, including but not limited to staging areas, storage yards, material borrow areas and storage areas, access roads, barges or platforms, etc., whether or not they reside within the Caltrans right-of-way.

### Construction Site Best Management Practices Manual

The Construction Site Best Management Practices Manual provides instructions for the selection and implementation of Construction Site BMPs. Caltrans requires contractors to identify and utilize these BMPs in preparation of their SWPPP or WPCP.

## Discharge

The term “discharge” refers to the amount of water flowing out of a drainage structure or facility. Discharge is often measured in cubic meters per second. It is any release, spill, leak, pump, flow, escape, dumping, or disposal of any liquid, semi-solid or solid substance.

## Disturbed Soil Area (DSA)

The disturbed soil area includes all construction activity that disturbs native soil and fill within the project limits. This does not include routine maintenance activity to maintain existing highways (facilities) or preventative maintenance to maintain highway structures, and existing functions. Asphalt concrete, Portland cement concrete, aggregate base, shoulder backing, bridge decks, sidewalks, buildings, road side ditches, gutters, dikes, and culverts are all part of existing highway facilities.

## Maximum Extent Practicable (MEP) Analysis

The MEP analysis is the process of evaluating the selected BMPs based on legal and institutional constraints, technical feasibility, relative effectiveness, and cost/benefit ratio.

## Metals (Total and Dissolved)

Metals, both total and dissolved, are commonly monitored constituents and, next to TSS and nutrients, are the most common constituents cited in the literature as being present in stormwater runoff.

Trace quantities of many metals are necessary for biological growth and may naturally occur in runoff. Most metals, however, have numeric water quality standards because of their toxicity to aquatic organisms at high concentrations.

The toxicity of some metals is inversely related to water hardness. The numeric water quality standards for cadmium, chromium, copper, lead, nickel, silver and zinc are hardness-dependent. Copper, lead and zinc are the metals most commonly found in highway runoff.

## Municipal Separate Storm Sewer System (MS4)

MS4s are storm drain systems regulated by the federal Phase I and Phase II stormwater regulations. Municipal combined sewer systems are regulated separately. MS4s are defined in the federal regulations at 40 CFR 122.26(b)(8). Caltrans is designated as an MS4 permittee.

## National Pollutant Discharge Elimination System (NPDES) Permit

The NPDES Permit is EPA’s program to control the discharge of pollutants to waters of the United States. NPDES is a part of the federal CWA, which requires point and non-point source dischargers to obtain permits. These permits are referred to as NPDES permits.

## Notice of Intent (NOI)

Information sent to a Regional Board indicating that a permittee would like to be covered under the terms of a NPDES permit or WDR.

## Notice of Termination (NOT)

Information sent to the Regional Water Board indicating that permit coverage is no longer needed and all permit requirements have been met. For example, when a Construction General Permit NOT is filed with a Regional Board, this indicates that construction is complete and final stabilization has been reached or ownership has been transferred.

## Numeric Action Level (NAL)

These are benchmark values, the exceedance of which require the discharger to take action to improve BMP performance or to install additional BMPs. The NALs help to determine if BMPs are working as planned. The Construction General Permit contains effluent pH and turbidity NALs.

### Numeric Effluent Limitations (NEL)

Under the Construction General Permit, Risk Level 2 and Risk Level 3 dischargers were required to comply with receiving water numeric effluent limitations. After these were challenged in court, they were invalidated. Compliance with NELs is no longer required, with one exception. Discharges from active treatment systems are required to meet NELs. NELs for Risk Level 2 and Risk Level 3 dischargers were replaced with receiving water triggers for pH and turbidity.

### Nutrients

Nutrients are nutritive substances such as phosphorous and nitrogen whose excessive input into receiving waters can over-stimulate the growth of aquatic plants.

### Pathogens

Pathogens include viruses, bacteria, protozoa, and possibly helminth worms and are a concern in stormwater runoff. The direct measurement of specific pathogens in water is extremely difficult. The coliform group of organisms is commonly used as an indicator of the potential presence of pathogens of fecal origin.

Sources of total and fecal coliforms in stormwater runoff are common and wide-spread (e.g., soil particles, droppings of wild and domestic animals, etc.). Human sources could include illicit sewer connections and seepage from septic tanks.

### Pesticides

A pesticide is a chemical agent designed to control pest organisms. The most common forms of pesticides are organic chemicals designed to target insects (insecticides) and vascular plants (herbicides).

Chlorpyrifos and Diazinon. Chlorpyrifos and Diazinon are organophosphate pesticides that have been detected in stormwater runoff. Organophosphates exhibit a high pesticidal activity and relatively low persistence in the environment. They also exhibit acute toxicity effects to humans and animals by inhibiting the acetylcholinesterase enzyme activity at nerve endings, which affects the proper functioning of the nervous system. Absorption through the skin is a major route of exposure for all organisms.

### Pollutant

Any constituent present in sufficient quantity to impair beneficial uses of a receiving water body.

### Receiving Water

A river, lake, ocean, stream or other watercourse into which wastewater or treated effluent is discharged.<sup>xciii</sup>

### Resident Engineer (RE)

The RE administers the construction contract, makes decisions regarding acceptability of material furnished and work performed, and exercises contractual authority to direct the contractor. The RE may impose sanctions if the contractor fails to follow the appropriate actions specified in the contract to correct deficiencies.

### Regional Water Quality Control Board (Regional Board)

A Regional Board is the agency responsible for water quality regulation for a region as specified in Section 13200 of the California Water Code. There are nine Regional Boards that serve under the SWRCB. These nine Regional Boards are located in California and are responsible for enforcing water quality standards within their boundaries. A map of these boundaries is located in Appendix A, Figure A-1.

In protecting water quality, each Regional Board:

- Adopts a region-specific Water Quality Control Plan or Basin Plan that contains water quality standards specific to the region's waters;
- Issues waste discharge requirements (WDRs) and water quality monitoring and reporting programs that implement the SWRCB's statewide policy and regulations along with the region-specific water quality standards specified in its Basin Plan; and
- Implements enforceable orders against violations of statewide and region-specific requirement

### Source Controls

Source controls are control measures used on disturbed areas to reduce the introduction of sediment or other pollutants into stormwater runoff. Source controls prevent or limit the exposure of materials to stormwater at the source of those materials.

### State Water Resources Control Board (SWRCB)

As delegated by the EPA, the SWRCB is a California agency that implements and enforces the CWA Section 401 (p) NPDES permit requirements, and is the issuer and administrator of the Caltrans Permit and the Construction General Permit. The SWRCB's mission is to preserve, enhance and restore the quality of California's water resources, and ensure their proper allocation and efficient use for the benefit of present and future generations.

### Storm Water Pollution Prevention Plan (SWPPP)

The Construction General Permit requires all construction projects that result in a DSA of at least one acre to develop and implement an effective SWPPP. The SWPPP is a plan that includes site map(s), an identification of construction/contractor activities that could cause pollutants in stormwater, and a description of measures or practices to control these pollutants. A Regional Board may require a SWPPP for projects which do not meet the DSA acreage requirements based upon water quality concerns.

### Total Suspended Solids (TSS)

TSS is the weight of particles that are suspended in water. Suspended solids in water reduce light penetration in the water column, can clog the gills of fish and invertebrates, and are often associated with toxic contaminants because organics and metals tend to bind to particles.

### United States Environmental Protection Agency (EPA)

The EPA (<http://www.epa.gov/>) provides leadership in the nation's environmental science, research, education, and assessment efforts. The EPA works closely with other federal agencies, state and local governments, and Indian tribes to develop and enforce regulations under existing environmental laws. The EPA is responsible for researching and setting national standards for a variety of environmental programs and delegates to states and tribes responsible for issuing permits, and monitoring and enforcing compliance. The EPA issued regulations to control pollutants in stormwater runoff discharges, such as the CWA.

### Waste Discharge Requirement (WDR)

A WDR is a set of conditions issued by a Regional Board for a specific activity. The conditions may include numeric effluent criteria, monitoring requirements, reporting requirements, and other narrative criteria for discharge. WDRs may be required for any authorized non-stormwater discharge.

### Waterbody

A waterbody is a water of the United States.<sup>xciv</sup> Waters of the United States include: (a) All waters, which are currently used, were used in the past, or may be susceptible to use in interstate or foreign commerce, including all waters which are subject to the ebb and flow of the tide; (b) All interstate waters,

including interstate wetlands; (c) All other waters such as intrastate lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, prairie potholes, wet meadows, playa lakes, or natural ponds, the use, degradation, or destruction of which would affect or could affect interstate or foreign commerce including any such waters: (1) which are or could be used by interstate or foreign travelers for recreational or other purposes; (2) from which fish or shellfish are or could be taken and sold in interstate or foreign commerce; or (3) which are used or could be used for industrial purposes by industries in interstate commerce; (d) All impoundments of waters identified in paragraphs (a) through (d) of this definition; (f) The territorial sea; and (g) Wetlands adjacent to waters (other than waters that are themselves wetlands) identified in paragraphs (a) through (f) of this definition.

### **Water Pollution Control Program (WPCP)**

A WPCP is a plan to identify water quality management practices to be implemented that must be prepared for all construction projects that do not require preparation of a SWPPP. For Caltrans projects disturbing more than one acre, a SWPPP satisfies the requirement for a WPCP.

### **Water Quality Flow (WQF)**

The WQF is a design criterion used for various types of filtration treatment control devices currently under development. Caltrans has cooperatively developed rainfall intensity values with the SWRCB that can be used in the Rational Formula to calculate the WQF.

### **Water Quality Volume (WQV)**

The WQV is the volume of flows associated with the frequent storm events that must be treated. The WQV of treatment BMPs is based upon, where established, the sizing criteria from the Regional Board or local agency (whichever is more stringent). If no sizing criterion has been established, Caltrans will do one of the following: maximize detention volume determined by the 85th percentile runoff capture ratio or; use volume of annual runoff based on unit basin storage WQV to achieve 80 percent or more volume of treatment. For further detail, refer to the Project Planning and Design Guide.

## F.1 Endnotes and Relevant Citations

<sup>i</sup> “Authorized non-storm water discharges may include those from . . . uncontaminated groundwater dewatering, and other discharges not subject to a separate NPDES permit adopted by a region.” Construction General Permit, Fact Sheet § E.

<sup>ii</sup> Caltrans, *Statewide Storm Water Management Plan*, CTSW-RT-12-286.19.1, § 4.5, May 2003 (Revised March 2011, March 2012, July 2012).

<sup>iii</sup> “Authorized non-storm water dewatering discharges may require a permit because some Regional Water Boards have adopted General Permits for dewatering discharges.” Construction General Permit, Fact Sheet § E.

<sup>iv</sup> This Dewatering Guide covers many different regulatory devices used by the Regional Boards. Construction General Permit describes the statewide general permit issued by the State Water Resources Control Board that governs construction and land disturbance activities on sites having greater than one acre of land disturbance, Order No. 2009-0009-DWQ (and amendments). The term general NPDES permit is used to refer to the permits issued by the Regional Boards.

<sup>v</sup> “The Contractor shall at all times observe and comply with . . . all existing and future laws, ordinances, and regulations . . . .” Caltrans, *2006 Standard Specifications*, §7-1.01. “Comply with laws, regulations, orders, and decrees applicable to the project.” Caltrans, *2010 Standard Specifications*, §7-1.01.

<sup>vi</sup> Caltrans, *2010 Standard Specifications*, §13-4.01B.

<sup>vii</sup> The Federal definition is contained in the Clean Water Act and is limited to surface waters. “The term ‘navigable waters’ means the waters of the United States, including territorial seas.” 33 U.S. Code § 1362(7). The federal definition has been limited through judicial interpretation, but broadened through agency rulemaking. Under the federal definition not all surface waters are covered under the Clean Water Act. *See also*, Proposed Rule, *Definition of “Waters of the United States” Under the Clean Water Act*, 79 F.R. 22188 (April 21, 2014). The California definition is broader and includes groundwater and saline waters. “‘Waters of the state’ means any surface water or groundwater, including saline waters, within the boundaries of the state.” Cal. Water Code § 13050(e) (2014).

<sup>viii</sup> “This Order does not regulate discharges from the Department’s construction activities, *including dewatering effluent discharges* from construction projects” (emphasis added). California State Water Resources Control Board, Order No. 2012-0011-DWQ, NPDES NO. CAS000003, *National Pollutant Discharge Elimination System (NPDES), Statewide Storm Water Permit Waste Discharge Requirements (WDRs) for State of California Department of Transportation*, Findings, § 9 (September 19, 2012; herein, “Caltrans MS4 Permit”).

<sup>ix</sup> Caltrans MS4 Permit, Findings, § 9.

<sup>x</sup> Caltrans MS4 Permit, § E.2.f.

<sup>xi</sup> “This General Permit authorizes the discharge of storm water to surface waters from construction activities that result in the disturbance of one or more acres of land, provided that the discharger satisfies all permit conditions set forth in the Order.

\* \* \*

This General Permit prohibits the discharge of pollutants other than storm water and non-storm water discharges authorized by this General Permit or another NPDES permit.

\* \* \*

The State Water Board recognizes, however, that certain non-storm water discharges may be necessary for the completion of construction projects. Authorized non-storm water discharges may include those . . . uncontaminated ground water dewatering, and other discharges not subject to a separate general NPDES permit adopted by a region.” Construction General Permit, Fact Sheet § E.

<sup>xii</sup> Construction General Permit, Fact Sheet § E.

<sup>xiii</sup> Lake Tahoe CGP, § II.D.1.a.

<sup>xiv</sup> “Discharges of non-storm water to land or land-based treatment systems may be necessary for certain construction projects. Such discharges include, but are not limited to . . . construction dewatering. These discharges to land are authorized under the following conditions: 1. The discharge does not violate any other provision of this General Permit. 2. The discharge is not prohibited by the Basin Plan or does not require a prohibition exemption from the Lahontan

Water Board for prohibitions contained in the Basin Plan. 3. The Discharger has included and implemented specific BMPs required by this General Permit to prevent or reduce the contact of the non-storm water discharge with construction materials or equipment. 4. The discharge does not contain toxic constituents in toxic amounts.” Lake Tahoe CGP, § III.B.

<sup>xv</sup> “Unless otherwise authorized by a separate waste discharge permit, discharges of material other than storm water, including dewatering waste, to a separate storm sewer system or waters of the state are prohibited. Discharge of dewatering waste to land is covered under this General Permit providing that there are no pollutants present that could degrade groundwater quality. If no land disposal alternatives exist for dewatering waste, the Discharger may seek coverage to discharge dewatering waste to surface waters under a separate NPDES permit by submitting a separate Report of Waste Discharge.” Lahontan Small Construction Permit, § I.G.

<sup>xvi</sup> “Authorized non-storm water discharges may include those from dechlorinated potable water sources such as: . . . uncontaminated ground water from dewatering, and other discharges not subject to a separate general NPDES permit adopted by a Regional Water Board.” Construction General Permit, § III.C.”

<sup>xvii</sup> “All discharges are prohibited except for the storm water and non-storm water discharges specifically authorized by this General Permit or another NPDES permit.” Construction General Permit, § III.B.

<sup>xviii</sup> “The discharge of non-storm water is authorized under the following conditions: 1. The discharge does not cause or contribute to a violation of any water quality standard; 2. The discharge does not violate any other provision of this General Permit; 3. The discharge is not prohibited by the applicable Basin Plan; 4. The discharger has included and implemented specific BMPs required by this General Permit to prevent or reduce the contact of the nonstorm water discharge with construction materials or equipment. 5. The discharge does not contain toxic constituents in toxic amounts or (other) significant quantities of pollutants; 6. The discharge is monitored and meets the applicable NALs and NELs; and 7. The discharger reports the sampling information in the Annual Report.” [“and NELs” was removed by 2012-0006-DWQ, State Water Resources Control Board, National Pollutant Discharge Elimination System (NPDES) General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (July 12, 2012)]

If any of the above conditions are not satisfied, the discharge is not authorized by this General Permit. The discharger shall notify the Regional Water Board of any anticipated non-storm water discharges not already authorized by this General Permit or another NPDES permit, to determine whether a separate NPDES permit is necessary.” Construction General Permit, § III.C.

<sup>xix</sup> State Water Resource Control Board, *Water Quality Order No. 2006-0008-DWQ, NPDES No. CAG990002, General National Pollutant Discharge Elimination System (NPDES) Permit for Discharges from Utility Vaults and Underground Structures to Surface Waters*, § III.B (July 19, 2006).

<sup>xx</sup> The permit has been extended administratively. A draft version of the revised Utility Vault permit is expected to be presented for public comment in the latter half of 2014.

<sup>xxi</sup> Codified at California Water Code, § 13100, et. seq. (effective January 1, 2014).

<sup>xxii</sup> See Caltrans, *2010 Standard Specifications*, §13-3.01B(2)(c) and §13-3.01C(1).

<sup>xxiii</sup> “Authorized non-storm water dewatering discharges may require a permit because some Regional Water Boards have adopted General Permits for dewatering discharges.” Construction General Permit, Fact Sheet § E.

<sup>xxiv</sup> “[The] Statewide General Order was adopted to handle those types of discharges that posed a low threat to water quality, but was not intended to supersede the authority of the Regional Water Quality Control Boards to issue individual WDRs or conditional waivers.” California Regional Water Quality Control Board Central Valley Region, *Resolution No. RS-2013-0145 Approving Waiver of Reports of Waste Discharge and Waste Discharge Requirements for Specific Types of Discharge within the Central Valley Region* (December 5, 2013).

<sup>xxv</sup> State Water Resource Control Board, *Water Quality Order No. 2003-0003-DWQ, Statewide General Waste Discharge Requirements (WDRs) for Discharges to Land with a Low Threat to Water Quality (General WDRs)* (April 30, 2003). WQO-2003-0003-DWQ is still in effect and is used if a discharge meets the eligibility requirements.

<sup>xxvi</sup> The word “pollutants”, as defined in the federal Clean Water Act §502(6), is incorporated into the California Water Code § 13373. “The terms ‘navigable waters,’ ‘administrator,’ ‘pollutants,’ ‘biological monitoring,’ ‘discharge’ and ‘point sources’ as used in this chapter shall have the same meaning as in the Federal Water Pollution Control Act and acts amendatory thereof or supplementary thereto [i.e., the CWA].” California Water Code § 13373. “The term ‘pollutant’ means dredged spoil, solid waste, incinerator residue, sewage, garbage, sewage sludge, munitions, chemical

wastes, biological materials, radioactive materials, heat, wrecked or discarded equipment, rock, sand, cellar dirt and industrial, municipal, and agricultural waste discharged into water.” 33 U.S. Code § 1362(6) [codified in CWA §502(6)].

<sup>xxvii</sup> Caltrans, *SWPPP Template*, § 500.1.1 (October 26, 2012).

<sup>xxviii</sup> Caltrans, *Construction Site Monitoring Program Guidance Manual*, § 6.5.1 (2012)

<sup>xxix</sup> Construction General Permit, § III.

<sup>xxx</sup> Such discharges “shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.”

Construction General Permit, § V.A.1.

<sup>xxxi</sup> Construction General Permit, § V.A.2 (“Dischargers shall minimize or prevent pollutants . . . through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.”). “BAT/BCT technologies not only include passive systems such as conventional runoff and sediment control, but also treatment systems such as coagulation/flocculation using sand filtration, when appropriate.”

Construction General Permit, Fact Sheet, §F.1.

<sup>xxxii</sup> Construction General Permit, Attachment A, § A.

<sup>xxxiii</sup> Construction General Permit, Attachment C, § I.3.b. And if the discharge of such accumulated water will occur after dark, observations must occur before dark. However, visual observations are only required during business hours.

Construction General Permit, Attachment C, § I.3.c.

<sup>xxxiv</sup> The Construction General Permit was amended so that NELs were removed for all types of discharges (i.e., Risk Level 1, 2, and 3), except for those from ATS. Receiving water triggers were included in the amended Construction General Permit. Receiving water triggers are effluent pH and turbidity limits. Failure to remain within those limits does not comprise a violation of the Construction General Permit. However, failure to conduct receiving water sampling when these limits are exceeded and comply with other related parts of the Construction General Permit may be considered a violation. State Water Resources Control Board, *National Pollutant Discharge Elimination System (NPDES) General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities*, Order No. 2012-0006-DWQ (July 17, 2012).

<sup>xxxv</sup> Caltrans, *SWPPP Template*, § 500.1.1 (October 26, 2012).

<sup>xxxvi</sup> Construction General Permit, §III.

<sup>xxxvii</sup> *Id.*, §V.A.1 (Such discharges “shall not contain a hazardous substance equal to or in excess of reportable quantities established in 40 C.F.R. §§ 117.3 and 302.4, unless a separate NPDES Permit has been issued to regulate those discharges.”).

<sup>xxxviii</sup> Construction General Permit, §V.A.2 (“Dischargers shall minimize or prevent pollutants . . . through the use of controls, structures, and management practices that achieve BAT for toxic and non-conventional pollutants and BCT for conventional pollutants.”). “BAT/BCT technologies not only include passive systems such as conventional runoff and sediment control, but also treatment systems such as coagulation/flocculation using sand filtration, when appropriate.”

Construction General Permit, Fact Sheet, § F.1.

<sup>xxxix</sup> NPDES permits expire every 5 years. The Regional Boards generally update their general NPDES permits within this time frame, but, in some instances, they have administratively extended the expiration date on these permits. The last round of general NPDES permit renewal occurred in 2013 (with the previous round occurring between 2007 and 2009). For this reason, it is expected that many of these general permits which were renewed in 2013 will again be renewed, revised, or reissued on or around 2018.

<sup>xl</sup> [http://www.waterboards.ca.gov/northcoast/about\\_us/contact\\_us.shtml](http://www.waterboards.ca.gov/northcoast/about_us/contact_us.shtml) (accessed 3/8/2014).

<sup>xli</sup> This general NPDES permit is scheduled to expire on July 23, 2014.

<sup>xlii</sup> “Construction dewatering of water where sediment and naturally occurring parameters (e.g., naturally occurring metals or salts, temperature, pH, etc.) in area ground water are the only pollutants of concern. . . .” Order No. R1-2009-0045, § I.B.1.a.

<sup>xliii</sup> A low treat discharge must be: 1) from a planned activity; 2) from a point source; 3) from a definable project; and, 4) be short term, have a minimized volume, or both. The discharge must 1) require a minimal level of treatment; 2) implement BMPs to eliminate or reduce pollutants and minimize volume and discharge rates, or 3) both require minimum treatment and implementation of BMPs.

“A low threat discharge is defined as a planned, short-term and/or minimized volume discharge from a definable project that results in a point source discharge where the discharge requires a minimal level of treatment and/or is

controlled to eliminate or reduce pollutants and minimize volume and discharge rates through implementation of best management practices (BMPs)." North Coast Regional Water Quality Control Board, *General NPDES Permit No. CA0024902 Waste Discharge Requirements for Low Threat Discharges to Surface Waters in the North Coast Region*, § I.A (Order No. R1-2009-0045; July 23, 2009).

<sup>xliv</sup> Annual fees depend on the threat to water quality ("1", "2", or "3"), the complexity of the discharge ("A", "B", or "C"), and whether the discharge is to land or a surface water or whether land disposal is utilized (Title 23 of the California Code of Regulations, Division 3, Chapter 9, Article 1). Many low threat discharges to land or surface waters are likely to be rated 3C, and thus, the annual fee is \$1,772 (current through 2/28/14; accessible through the California Office of Administrative Law, <http://www.oal.ca.gov/>). Note, however, that additional fees may apply. For example, Region 5's 2014 fee for a 3C discharge is \$1,940.

<sup>xlv</sup> The notice will indicate that a) the discharge is eligible for coverage and 30-day public notice period has started, b) coverage under the general permit will be considered at a regularly-scheduled hearing of the Regional Water Board, or c) the discharge is ineligible for coverage under the general permit and whether coverage may be obtained under an individual permit. Order No. R1-2009-0045, § II.B.

<sup>xlvi</sup> "a. No significant comments were received and coverage under this General Permit is granted; or b. Significant comments were received and coverage under this General Permit shall be considered at a regularly scheduled Regional Water Board hearing; or c. Significant comments were received and an individual permit is required for the discharge." Order No. R1-2009-0045, § II.B.3.

<sup>xlvii</sup> An exception may be granted if the four criteria listed in Section II.A.3. are met. Order No. R1-2009-0045, § II.A.3.

<sup>lxv</sup> State of California Regional Water Quality Control Board Lahontan Region, *Water Quality Control Plan for the Lahontan Region*, page 5.2.-2 (Plan effective March 31, 1995, amendments effective through 2005).

<sup>lxvi</sup> *Id.*, page 5.2-3.

<sup>lxvii</sup> "Discharge under this General Permit will only be authorized when land disposal is not a practical or feasible option based on information or evidence provided by the applicant within the NOI." California Regional Water Quality Control Board Lahontan Region, *Renewed Waste Discharge Requirements and National Pollutant Discharge Elimination System General Permit for Limited Threat Discharges to Surface Waters*, Findings § 8 (July 23, 2008). This same phrase is included in the *Tentative Renewed Waste Discharge Requirements and National Pollutant Discharge Elimination System General Permit for Limited Threat Discharges to Surface Waters* ("Tentative Order") (March 26, 2014).

<sup>lxviii</sup> Order No. R6T-2008-0023, Findings, § 11. The Tentative Order also includes this language.

<sup>lxix</sup> "It is not intended . . . to regulate discharges that contain industrial chemicals, chlorinated hydrocarbons, or organic

pollutants, herbicides, pesticides, oil and grease, radioactivity, salinity or any substance or physical property in significant quantities that may adversely affect beneficial uses or cause acute or chronic toxicity to aquatic life in the receiving waters for the discharge.” Order No. R6T-2008-0023, Findings, § 10. The Tentative Order also includes this language.

<sup>lxx</sup> In the Tentative Order, this is Attachment A.

<sup>lxxi</sup> In the Tentative Order, this procedure is changed and the discharger receives coverage under the permit if the Regional Board does not respond 30 days after the submittal of a complete NOI and supporting documentation.

<sup>lxxii</sup> In the Tentative Order, this is Attachment E (almost all other permits and WDR use Attachment E for the monitoring and reporting program).

<sup>lxxiii</sup> Discharges from construction dewatering to land are allowed as long as: 1. the discharge complies with the general NPDES permit; 2. the discharge is not prohibited by the basin plan; 3. contact with construction materials or equipment is prevented or minimized; and, 4. the discharge does not contain toxics. Order No. R6T-2011-0019, § III.B.

<sup>lxxiv</sup> SMARTS is available at <https://smarts.waterboards.ca.gov/>

<sup>lxxv</sup> These general WDRs are still applicable. They cover regulation of small construction activities mostly in areas where only waters of the state are present.

<sup>lxxvi</sup> A “construction activity that results in land disturbance of 10,000 square feet or more and is not covered under . . . Water Quality Order 99-08-DWQ” referencing the previous construction permit. This permit has been superseded by the 2009 Construction General Permit, Order No. 2009-0009-DWQ. The 2009 Construction General Permit applies to construction sites having land disturbance of greater than one acre.

<sup>lxxvii</sup> [http://www.waterboards.ca.gov/coloradoriver/about\\_us/contact\\_us.shtml](http://www.waterboards.ca.gov/coloradoriver/about_us/contact_us.shtml) (accessed March 18, 2014).

<sup>lxxviii</sup> “Dischargers of low threat wastewaters to surface waters, who have been enrolled for coverage to allow the discharge under an existing Statewide or Regional Water Board-wide permit as listed in Table 3 or an individual permit, are not required to apply for coverage . . .” Order No. R7-2009-0300, § I.B. The Construction General Permit is listed in Table 3 and thus, in Region 7, the Construction General Permit should be used to regulate the dewatering discharge.

<sup>lxxix</sup> For the permit to apply, the following must be true: 1) pollutant concentrations in the discharge must not cause or contribute to “an excursion above any applicable water quality objective”; 2) the discharge must meet screening levels (Attachment B of permit) or meet the effluent limitations contained within the permit; 3) no dilution; and, 4) the discharger must comply with all of the terms of the permit.

<sup>lxxx</sup> “**Dewatering Activities.** Entities discharging treated or untreated groundwater from . . . temporary dewatering operations to construct or protect pipelines and other structures from groundwater infiltration or flotation.” § I.A.2.

All low threat discharges must meet effluent limitations for total suspended solids, oil and grease, pH, total petroleum hydrocarbons, and total residual chlorine. Dischargers must also meet effluent limitations for the waterbody for which the discharge will occur.

<sup>lxxxi</sup> “Where no pollutants are discharged to surface or ground water, and the construction site is *less than one acre in size* [ ]” (emphasis added), Resolution No. R7-2003-0008, Attachment A, Item 8.

<sup>lxxxii</sup> [http://www.waterboards.ca.gov/santaana/about\\_us/contact\\_us.shtml](http://www.waterboards.ca.gov/santaana/about_us/contact_us.shtml) (accessed March 20, 2014).

<sup>lxxxiii</sup> The permit expired on March 1, 2014, but has been administratively extended until the permit renewal is complete. Renewal may occur sometime later in 2014.

<sup>lxxxiv</sup> “All wastewater discharged in a manner so that it will percolate into the ground before reaching surface waters . . .” Santa Ana Regional Water Quality Control Board, *Resolution No. R8-2013-0015 Waiver of Waste Discharge Requirements for Specific Types of Discharges*, Attachment A (March 22, 2013).

<sup>lxxxv</sup> Cal. Water Code § 13050.

<sup>lxxxvi</sup> [http://www.waterboards.ca.gov/sandiego/about\\_us/contact\\_us/](http://www.waterboards.ca.gov/sandiego/about_us/contact_us/) (accessed March 20, 2014).

<sup>lxxxvii</sup> This waiver expired on February 3, 2014. As required by Cal. Water Code § 13269 all waivers must be reviewed every 5 years. As a result of that review, a waiver must be renewed or terminated. For a project that received coverage under the waiver in the past, the project can continue to receive coverage under the waiver at the discretion of the Regional Board’s executive director. The waiver is in the process of being renewed. Until it has been renewed, new dischargers must get permit coverage under one of the two general NPDES permits which cover dewatering (R9-2007-0034 and R9-2008-0002) or under a site-specific NPDES permit. Phone conversation between Roger Mitchell and

Brad Dickson (May 8, 2014).
