

SUPERIMPOSE FOOTING LOCATIONS ON LOG OF TEST BORINGS SHEET

On certain structures, the Engineering Geology Branch will include in the foundation recommendations, a request that footing locations be superimposed on the plan view of the Log of Test Borings tracings.

The structures that will be selected for this requirement are very large and complex structures, or those where the geological conditions are so varied that a small change in footing locations could result in significant changes in foundation recommendations. The information to be shown will be a dimensionless plot of the footings, bent numbers and bottom of footing elevations. Piles should not be shown.

These additions to the Log of Test Boring tracings should be made prior to requesting a foundation review.
