NOVEMBER 2023

Project Title:
Battery-Electric Sweeper Evaluation

Task Number: 4137

Start Date: June 1, 2023

Completion Date: May 1, 2025

Task Manager:
Azeddine Benouar
Transportation Engineer (Electrical)
Azeddine.Benouar@dot.ca.gov

Field Study of Battery-Electric Sweepers

Evaluating the effectiveness, benefits, drawbacks, and special use cases of Battery-Electric (BE) street sweepers as alternatives for traditional fuel technologies.

WHAT IS THE NEED?

The largest source of the state's greenhouse gas (GHG) and several smog-causing pollutant emissions is California's transportation sector including tailpipe emissions, oil extraction, and oil refining (https://ww2.arb.ca.gov/sites/default/files/classic/cc/inventory/2000-2020_ghg_inventory_trends.pdf). In order to reduce GHG emissions and improve air quality, California is moving towards Zero-Emission Vehicles (ZEVs), which do not produce any on-road GHG emissions or criteria pollutants. The California Air Resource Board (CARB) has ZEV targets in place for light-duty vehicles and in 2020 CARB adopted ZEV requirements for heavy trucks (<https://ww2.arb.ca.gov/news/california-takes-bold-step-reduce-truck-pollution>). Caltrans' Division of Equipment (DOE) will be acquiring eighteen BE street sweepers in the spring of 2023 to help the state meet its climate and air quality goals. With the implementation of this new street sweeper technology, there will be a need to understand specific usage and performance characteristics for the new technology in order to help evaluate the benefits, drawbacks and nuances of the introduction of this new equipment to the Caltrans fleet.

WHAT ARE WE DOING?

This research project will collect and evaluate detailed activity and Controller Area Network (CAN Bus) data from a subset of at least five BE street sweepers and fleet management level activity data from the Geotab fleet management system for all eighteen newly acquired BE street sweepers in the Caltrans fleet. Additionally, survey of Caltrans BE sweeper operators and mechanics will be conducted to help characterize function and performance of the BE sweepers.

DRISI provides solutions and knowledge that improves California's transportation system

WHAT IS OUR GOAL?

This research project will collect and evaluate detailed activity and Controller Area Network (CAN Bus) data from a subset of at least five BE street sweepers and fleet management level activity data from the Geotab fleet management system for all eighteen newly acquired BE street sweepers in the Caltrans fleet. Additionally, survey of Caltrans BE sweeper operators and mechanics will be conducted to help characterize function and performance of the BE sweepers.

WHAT IS THE BENEFIT?

This research will provide necessary information to help assess the effectiveness, benefits, drawbacks, and special use cases of BE street sweepers as alternatives for traditional or competing fuel technologies.

WHAT IS THE PROGRESS TO DATE?

The UC Riverside Research Team completed and submitted for review the draft literature review. The panel provided comments and the literature review was revised. The team worked on the survey of Caltrans' BE Street Sweepers operators and the data collection plan. The project panel held a status meeting via teleconference on 9/28/2023.
