CHAPTER 3I. ISLANDS

Section 3I.01 General
Support:
01 This Chapter addresses the characteristics of islands (see definition in Section 1A.13) as traffic-control
devices. Criteria for the design of islands are set forth in “A Policy on Geometric Design of Highways and
Streets” (see Section 1A.11).

Option:
02 An island may be designated by curbs, pavement edges, pavement markings, channelizing devices, or other
deVICES.

Support:
03 Raised channelization with sloping (mountable) curved medians are used instead of channelization accomplished
through the use of pavement markings (flush), for the following operating conditions:
A. Left- and right-turn lane treatments at intersections on all roadways with operating speeds of less than 40 mph.
B. Right-turn treatments on roadways with operating speeds equal to or greater than 40 mph.
04 On State highways, criteria for the design of islands are set forth in Caltrans’ Highway Design Manual. See Section 1A.11
for information regarding this publication.

Section 3I.02 Approach-End Treatment
Guidance:
01 The ends of islands first approached by traffic should be preceded by diverging longitudinal pavement
markings on the roadway surface, to guide vehicles into desired paths of travel along the island edge.

Support:
02 The neutral area between approach-end markings that can be readily crossed even at considerable speed
sometimes contains slightly raised (usually less than 1 inch high) sections of coarse aggregate or other suitable
materials to create rumble sections that provide increased visibility of the marked areas and that produce an
audible warning to road users traveling across them. For additional discouragement to driving in the neutral area,
bars or buttons projecting 1 to 3 inches above the pavement surface are sometimes placed in the neutral area.
These bars or buttons are designed so that any wheel encroachment within the area will be obvious to the vehicle
operator, but will result in only minimal effects on control of the vehicle. Such bars or buttons are sometimes
preceded by rumble sections or their height is gradually increased as approached by traffic.

Guidance:
02 When raised bars or buttons are used in these neutral areas, they should be marked with white or yellow
retroreflective materials, as determined by the direction or directions of travel they separate.

Standard:
04 Channelizing devices, when used in advance of islands having raised curbs, shall not be placed in such
a manner as to constitute an unexpected obstacle.

Option:
02 Pavement markings may be used with raised bars to better designate the island area.

Section 3I.03 Island Marking Application
Standard:
01 Markings, as related to islands, shall consist only of pavement and curb markings, channelizing
devices, and delineators.

Guidance:
Option:
02 Pavement markings as described in Section 3B.10 for the approach to an obstruction may be omitted on the
approach to a particular island based on engineering judgment.
**Standard:**
03 Double solid 4 inch wide yellow lines shall be used to delineate the edge of a median island where the median is an all-paved, at-grade section of the highway. The island formed by double yellow lines shall be at least 2 foot in width, as shown in Figure 3A-107(CA).
04 When used, other markings in the median island area shall be yellow.

**Support:**
05 This treatment is not intended for freeways or other highways with a positive barrier in the median. Single solid yellow left edge line and markers as shown in Figure 3A-105(CA) are standard.
06 The use of channelizing lines are shown in Figure 3A-112(CA) and no-passing markings are shown in Figures 3A-104(CA) and 3B-15.

**Section 3I.04 Island Marking Colors**

**Guidance:**
01 Islands outlined by curbs or pavement markings should be marked with retroreflective white or yellow material as determined by the direction or directions of travel they separate (see Section 3A.05).
02 The retroreflective area should be of sufficient length to denote the general alignment of the edge of the island along which vehicles travel, including the approach end, when viewed from the approach to the island.

**Option:**
03 On long islands, curb retroreflection may be discontinued such that it does not extend for the entire length of the curb, especially if the island is illuminated or marked with delineators or edge lines.

**Section 3I.05 Island Delineation**

**Standard:**
01 Delineators installed on islands shall be the same colors as the related edge lines except that, when facing wrong-way traffic, they shall be red (see Section 3F.03).
01a Delineators installed on islands shall be the same colors as the related edge lines.

**Support:**
01b In California, red markers are used for wrong-way traffic, not delineators.

**Standard:**
02 Each roadway through an intersection shall be considered separately in positioning delineators to assure maximum effectiveness.

**Option:**
03 Retroreflective or internally illuminated raised pavement markers of the appropriate color may be placed on the pavement in front of the curb and/or on the top of curbed approach ends of raised medians and curbs of islands, as a supplement to or as a substitute for retroreflective curb markings.

**Section 3I.06 Pedestrian Islands and Medians**

**Support:**
01 Raised islands or medians of sufficient width that are placed in the center area of a street or highway can serve as a place of refuge for pedestrians who are attempting to cross at a midblock or intersection location. Center islands or medians allow pedestrians to find an adequate gap in one direction of traffic at a time, as the pedestrians are able to stop, if necessary, in the center island or median area and wait for an adequate gap in the other direction of traffic before crossing the second half of the street or highway. The minimum widths for accessible refuge islands and for design and placement of detectable warning surfaces are provided in the “Americans with Disabilities Act Accessibility Guidelines for Buildings and Facilities (ADAAG)” (see Section 1A.11).
